Copper.

The copper trade in England is beginning to feel the effects of the abundant yield of American mines. The policy of some of the large mining companies in announcing to the world their intention to increase their production, together with the report of negotiations pending for large quantities of copper matte to be shipped from this country to England this year, has borne its natural result, and the price of £50 has been reached for Chile bars in the Liverpool market. It seems apparent that some large mining companies cannot produce copper to a profit at the purity of £50 for Chilo bars, while the profits of others will be largely diminished. Possibly, if prices should fall much lower, some concerted actiou will be taken to limit supplies, in which case we may see an advance.

The following significant sentence occurs in the last report of James Lewis & Sons, the Liverpool ore dealers: "Arrivals from the United States have again been on a very limited scale —only 1,206 tons. On the other haud, the consumptive demand, especially for Birmingham, has fallen off. The competition of American and other ingot copper has materially affected the value of English best selected, and unless English smelters are willing to pay better prices for American ore and matte than they at present offer, we may look to see ere long chief part of tho American production arriving here in the form of bars and ingots, and India supplied direct with American sheet copper. The abstention of smelters from purchases of furnace material has been a noticeable feature during the month. Six thousand tons of Rio Tinto regulus, of abont 30 per cent, have, however, been sold for delivery here at the rate of 500 tons monthly, at a price based on that of Chile bars at the time of delivery, and a considerable quantity of American copper matte for forward delivery at 10s. per unit."

The arrivals in Liverpool from Chili, in November, were 2,149, and deliveries 1,624; and from other countries 3,080 and 3,019 tons respectively. From the United States in the same month there was received 1,206 tons of fine copper, consisting of 521 tons of bars, 89 ingots, 282 matte, and 1,797 tons of ore. Chili exports up to Dec. 1st, for the year, equal 42,150 tons of fine copper, and stocks of West Coast products on haud are 23,413 tons fine. Stocks of other than Chili, produced 8,921 tons. The total month's supply is 44,624 tons. From the United States they have received for the first eleven mouths this year, at Liverpool and Swansea, 15,851 tons of fine copper.

REMOVALS.—Several prominent firms are changing their head-quarters with the new year. The Judson Manufacturing Company are removing to Nos. 8 and 10 Pine street. John Taylor & Co., dealers in assayers' goods, chemicals, etc., are about to take possession of the fine new building Nos. 114, 116 and 118 Pine street. The California Wire Works will, about January 15th, move to the southeast corner of Fremont and Market streets.

AMONG the recent shipments of the Dean Bros.' steam pump works, Indianapolis, Ind., were two large steam pumps having 20-inch steam cylinders, 14-inch water cylinders and 24-inch stroke. One went to Muscatine, Iowa; the other to the Cloquet mine. Each pump can deliver 1,600 gallons per minute.

Lead Smelting.

Lead smelting can be conducted most economically at a point where ores of a different character find a joint market, and where, at the same time, railroad facilities enable the smelter to obtain his fuel, flux, etc., and ship his product at low freight rates. But in such places—of which Leadville is one—it takes skill to purchase ores in suitable proportion to flux each other, and large smelting capacity to make the enterprise profitable. In Leadville the increase of capacity reduced the cost of labor about one-half. For instance, at Leadville in 1879, when the railrosd was 35 miles off, charcoal was 14 cents per bushel of 14 pounds; coke, $30.70 per ton; in 1882 charcoal, 10½ cents, coke, $15. In 1879 average cost of fuel for ton of ore was $8.92; in 1882, $5.66. The cost of labor when they had two 42-inch furnaces was $5.20 per ton, and when they had five large ones was $2.79 per ton.

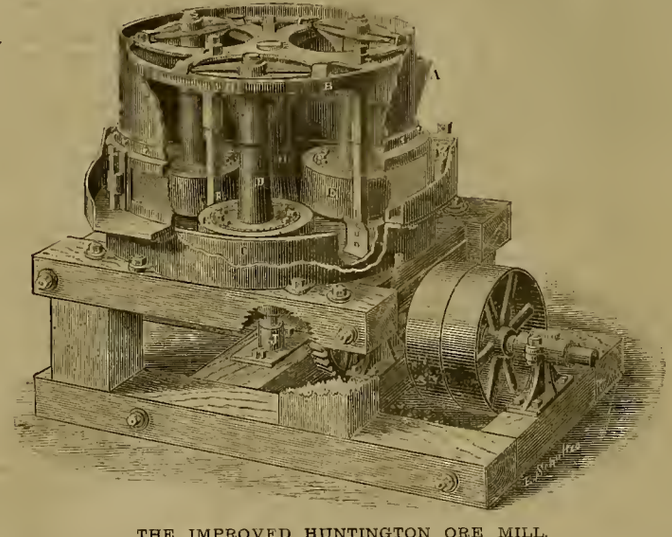
This shows that large capacity materially decreases cost of labor. There is a growing tendency to establish smelting works at more central points, where competing railroads intersect, like Denver, Pueblo, etc., where extensive works have been put up. On this coast we have only had one smelting works of note—the Selby Works in this city. The company owning them are now putting up more extensive works on the line of the Southern Pacific and Central Pacific Railroads, near Port Costa, at a point where deep-water ships can come alongside the wharf or front, and the railroad track is in the rear. It is understood that the new plant of the Selby Company will he more extensive and of greater capacity. Many improvements are being made. The works will afford a fine place for the marketing of the ores of this coast.

MUCH interest was excited in New Orloans by the unloading of the famous silver brick from Mexico. A gang of men, equipped with pulleys and ropes, dragged the monster across the main building, between the files of admiring visitors. The brick is six feet long and three and a half feet wide and six inches thick. It is of solid silver and valued at two hundred thousand dollars.

The Huntington Mill.

The Huntington roller quartz mills have now been on the market some little time, and have been put through the test of practical experience pretty thoroughly. The inventor has made several improvements since the mill was designed, and the engraving on this page shows it as now made. He now uses a rolled steel ring and die, and rolled steel roller rings. He has experimented with different sizes, from three to five feet in diameter, and finds the three and a half feet mill the best.

The engraving shows a part of the pan broken away, so the mechanism can be seen. E represents the rollers, which have cylindrical shoes surrounding them, which may be replaced when worn out. These rollers have vertical shafts, D, and these shafts extend up through



THE IMPROVED HUNTINGTON ORE MILL.

sleeves, on which they are fitted to turn. The sleeves have horizontal trunnions, which turn in boxes on the frame, B, which is keyed to a central shaft, G. Scrapers F serve to cut the material from the bottom of the pan, so the rollers do not touch the bottom, so that it will be carried between the roller and annular die C, until it is ground fine enough to pass through the screen. The rollers are allowed to swing to and fro from the center of the pan, and when the frame, B, is rapidly rotated, the rollers are thrown outward by centrifugal force against the die, C. The ore is fed in through the hopper, A.

Within the last week Mr. Huntington has sold five of these mills. Geo. W. Bothwell, of Lewis, Nev., who has been using one mill has purchased another, which is a practical endorsement. The Paradise Valley Mining Company has purchased three mills; and Shugart & Morgan, Jackson, Amador county one. Messrs. Fraser & Chalmers, of Chicago, are now manufacturing theso mills east of the Rocky Mountains. Mr. Huntington himself makes them on this coast.

THE Utah Mine on the Comstock has been shut down because there are not funds enough in the treasury to pay expenses of current month. Only such work as is necessary to preserve the property of the company is being done.

Abandonment of Mining Claims.

The provisions of the U. S. mining laws, which require annual expenditures on mining claims, are not well known to miners. If the required expenditure is not made within the specified time, or work commenced after the failure and before relocation, the claim is open to relocation the same as if no previous location had ever been made. The period within which the work must be done begins on the first day of January, succeeding the date of location, and each year after that (until patent issues) certain work must be done in order to keep the title clear. The courts have decided that the failure to perform work on a claim required by usual laws or regulations amounts to an abandonment, and thereupon it may be occupied and appropriated by another. In its common law sense, abandonment is purely a question of intention. An abandonment takes place when the ground is left by the locator without any intention of returning or making any future use of it, independent of any mining rule or regulation.

Although since the laws requiring annual expenditures have been passed, there is not so much doubt of the question of abandonment as before, yet claims are sometimes virtually abandoned long before the end of the year when more work must be done to retain ownership. In a case of this kind, however, the Courts have decided that to support the plea of abandonment there must appear from the evidence that there was a leaving of the claim, without any intention of returning or making any further use of it; and it is competent for the opposite party to prove, on rebuttal, any acts explanatory of the leaving which tend to show that it was not accompanied with an intention not to return. Abandonment is a mixed question of law and fact. If in fact, a person intends to give up his mining claim and quit paying assessments in pursuance of that intention, it is an abandonment in fact. The Courts have decided also that when an abandonment takes place a vacancy on the possession is created, and without such a vacancy no abandonment can take place.

Abandonment is a word which has acquired a technical meaning, and there is no reason why it should receive a different signification when applied to a mining claim than that which it has received in the books. As stated, there was formerly considerably litigation over this subject, though now, happily, if a man does not do his annual assessment work, the law considers he has abandoned the claim, and any one can take it up.

A party relocating an abandoned mining claim may sink new shafts, or continue work on such as may have been abandoned. The party abandoning, however, has the right to remove any ore he may have extracted, or any machinery or buildings he may have placed on the claim. Where an alleged abandonment occurred subsequent to the publication of the notice of application for patent and prior to the payment and entry, the Land Office would be compelled to take jurisdiction. Where adverse locations are made prior to the application for patent, controversies as to right of possession growing out of such relocations must be adjudicated by the Courts.

QUICKSILVER has advanced in Liverpool to £6 5s. and £6 15s. per flask.

CORRESPONDENCE.

We admit, unchanged, opinions of correspondents.—EDS

Mining at Tuscarora, Nevada.

[From our Traveling Correspondent.]

In comparison with other districts of the State, Tuscarora may be put down as one of the liveliest. Two or three mines are making large bullion shipments, aggregatiug upwards of $100,000 per month. One mine has recently commeuced paying regular monthly dividends, while another may be expected to resume payments at no distant day. The camp, within its ten years existence, has produced many millions of dollars—probably somewhere from six to eight—the exact figures not being at hand—and as many more millions, from present outlook, may be anticipated the next decade.

The Grand Prize.

At one time the leadiug mine of the place and the largest bullion producer, was located in 1875, but no work was done on it before the followiug summer. At that time it passed into the hands of Mr. Grayson, who forthwith commenced the erection of hoisting works and also a 10-stamp mill for ore reduction. Since that date the mine has yielded not less than four millions and paid $450,000 in dividends. Above water level to the depth of 180 feet, it contained a chloride ore in quantity and easily milled, whereupon a large 20-stamp mill was put up in immediate connection with the hoisting works. Below this point the ore changed to a sulphuret, when a furnace for roasting was erected. The three-compartment shaft was afterwards sunk to the depth of 780 feet and a 12-inch Cornish pump put in place to handle the water.

In June, 1883, the hoisting works were destroyed by fire, and the water rose to within 35 feet of the 400 level, where it seems to find an outlet. As nothing of permanent value was found at the deepest level reached, there appeared to be no good reason to justify the company in the erection of new hoisting works and the expense attendant on securing another pumping engine; so that the work has recently been wholy confined to the ground above the 400-foot level. The ledge formerly worked is understood to be an east and west veio, while the developments of rich ore have been made on a north and south ledge, running at right angles to the old workings. The vein has been worked up to 170 feet above the 400 station, and is represeuted to be large. It is producing 15 tons of ore per day, averaging about $175 per ton, and furnishing at present $14,000 per week for shipment.

Above the point just named, it is said to be all virgin grouud, and as it is reasonable to infer that the good ore will continue all the way up to the surface, there is yet an immense amount remaining to be extracted, so that the life of the mine bas yet a long lease, it is hoped, and may agaiu rival in production her best dividend payiug days.

The Navajo Mine.

Mr. W. C. Price, superintendent, probably stands next to the Grand Prize as to bullion yield to date, having turned out not less than $1,500,000, and paid as much as $275,000 in dividends. For some time past it has been the leading mine of the district, and is still somewhat in excess of any other in her monthly shipments, besides being on a very substantial basis financially. She assumed payment of monthly dividends of 25 cents per share to the stockholders in November last, and had a cash balance on hand Dec. 1st of $106,000. Her monthly shipments amount to $60,000, the ore at present milled, averaging $185 per ton.

During the fiscal year, ending Aug. 12th, the mill of 10 stamps, owned jointly by the Navajo and Independence companies, ran 227 days and a fraction, reducing 2,243 tons of Navajo ore in addition to some custom work; the average battery assay $104, working up to about 92 per cent.

The bulk of the ore was taken from the 450 foot level, and is said to be not yet exhausted. From the 150 down to the 650 foot, exploiting has gone on simultaneously with ex racting and reducing of ore for the past two years, and there is still a very considerable extent of new and undeveloped ground in nearly every level.

Only a few de ails can be giveo. A winze from the 150 foot sunk 50 feet, connecting with an upraise from the 250 foot level, encountered from one to two feet of chloride ore, giving sample assays from $300 to $700—a part of the vein going much higher. A crosscut to the vein 335 feet south of the Belle Isle line in connection with the developmen's of winzes, shows the value of the rock to he worth several hundred dollars per ton, and to carry from 20 to 30 per cent in gold. In drifting a few feet south the vein had widened to 5 feet, with three feet of ore that will work from $350 to $500 per ton.

From this level there are also 225 feet of backs. Although the ground cannot be said to have been explored, as all the ore bodies of the mine have iovariably extended to the surface, the superintendent is confident that the result will be altogether favorable.

Ore of good quantity and quality is reported on the east lateral vein of the 250-foot level, and on the 350, the ore, by assorting and concentrating, has been made to work up to $80 per ton, and it is understood that a large amount on this level remains to be extracted. From the explorations on the 550 and 650 levels the indications point to the striking of ore bodies similar in richness to those previously found in the mine.

Many important improvements have been made the past year about both mine and mill. A 20-inch Cope & Maxwell pump bas been placed in one of the lower levels, capable of handling any probable flow of water. In the machine shop there has been added an 18-foot lathe, drill press, and many other things essential for quick and economical work.

In addition to a number of much-needed buildings, there have been supplied to the mill a No. 7 Burleigh compressor and two large boilers. Also a 20,000 gallon tank with pipe, laid to furnish the mill with water.

The Independence.

under the same management as the Navajo, has had shaft No. 1., at the south end of the mine, sunk an additional 100 ft., besides a great deal other work in the way of exploration.

The shaft followed the vein all the way down, showing a fair width of milling ore. Perhaps the most important disclosure made during the past year, is the discovery of an east and west vein of good average size, the ore at first being somewhat irregular in grade, but growing richer as the work progressed. The last taken out is represented to be as good as the best ever extracted from the mine. The ground, particularly towards the west, and of this vein, gives promise of a better day about to dawn on the mine.

The Belle Isle and North Belle Isle.

The present prospecting work in the Belle Isle mine proper, is developing some good ore, and its future outlook is thought to be flattering.

Her bullion product has reached the neighborhood of $750,000, and her dividends have amounted to $300,000.

The North Belle Isle

Has encountered another ore body, that so far as developed, promises a good output at no distant day, and possibly, a resumption of divideuds. From the brief notice here given, it must be evident that the mining camps of the State are few and far between that can show at this time, a better record. Before closing, it may be well to state, that Tuscarora is favored with a good foundry, owned and run by Messrs. Jack and Dove. It has appliances for making castings up to 5,000 lbs. for all kinds of milling, mining and agricultural purposes. In addition to this, general machine, blacksmith and boiler work is done, together with repairing, besides carrying a large stock of second-hand machinery to supply the wants of the district. A. C. K.

Wood River Smelters.

The Idaho *Keystone* says: Since the middle of June, the time of starting this season, the Philadelphia smelters, with one 50-ton stack in operation, have made a fine showing, and afford an illustration of what can be done when the mines in the neighborhood are sufficiently developed to keep all four of the stacks in operation, which, no doubt, will be the case in the course of another season.

The competition in ore buying in the different towns on Wood River bas been brisk all season, and much of the product of our mines finds its way to different points East, aud also to San Francisco. The Philadelphia smelters have had one stack running since about the middle of June, with the exception of an occasional stoppage, incident to all smelters and mills. The output of bullion in that time demonstrates what could he done if the furnaces were run to their full capacity—180 tons per day. The plant consists of two 40-ton stacks and two of 50 tons each. The works are only second in size to one or two similar plants in the United States, and in many respects the advantages of the Ketchum plant are not equalled in the world. The surroundings are not excelled anywhere; water, timber, the natural advantages of location, being all that could be desired. As an ore center, also, it has no equal, of which Ketchum is the center of the largest and richest mineral field in the West, as acknowledged by mining men. The smelting arrangements are as complete as can he made by man, and every facility for operatiog the works successfully is at hand.

We took a stroll through the smelters a few days ago, and noticed the different changes the ore goes through before it comes out in white, sparkling bullion. The branch, or "Y" extension from the main railway track, is completed to within a short distance of the smelters, from which point a trestle will connect the road with the smelters.

Up to date, 104 cars of bullion have been turned out since the time above mentioued. A carload is 12 tons, or 240 bars of 100 pounds each. The grand total is about 1,300 tons of bullion, or in the aggregate 2,600,000 lbs., at an average of $300 per ton, or $390,000 in all, since June. The showing of bullion speaks well for the smelters and the camp, and gives a good idea of what the country will be able to do when our mines are better developed. Aside from the ores reduced by the Philadelphia smelters, over 1,000 tons of high grade smelting ores have been sold in Ketchum and vicinity during the past month and shipped to Salt Lake and other points.

Idaho's Mining Interests.

The following is an extract from the Governor's annual report to the Secretary of the Interior: —This Territory, rich in its practically boundless deposits of mineral wealth, has not developed as extensively within the past year as was expected. Many of our rich miuing districts are even now virtually idle. This much-to-be-deplored condition is occasioned by various circumstances and conditions. The more important of which are: The timidity of capital, lack of scientific knowledge on the part of the average miner and lack of practical experience on the part of the average expert. There are other difficulties in the way, which stand as insurmountable barriers to the rapid progress of mining in Idaho. The mining laws are imperfect. Mining interests need the strong hand of rigorous law to call back operations to the mines when they shall be real, instead of figuring upon the stock boards, where they are pretentious shams based upon the credulity of the people, which state of things is fast confounding the suppositions with the real, and has always worked to the great detriment of honest mining. If there were a school or system established that would bring about a happy medium between the unlearned miner and the theoretical expert, it would redound to the general good and to a considerable extent preclude the possibility of investors in mining being so often, so extensively and outrageously swindled by sharpers and company mongers.

Mining is our chief source of wealth, and employs in the Territory a greater number of men, despite all the drawbacks, and a greater amount of capital than any other industry. The development in gold and silver during the past year has been at a ratio of 50 per cent, the output of mineral wealth from the Territory being, as nearly as can be ascertained, $7,000,000. Idaho has greater mineral belts than any other Territory or State in the Union. The most extensive belt lies on the Western slope, and the spurs of the Rocky mountains that enter the Territory in Oneida county, and run the entire length of it to Lake Pen D'Oreille, a distance of 110 miles. The mines and discoveries on this immense belt, now being worked, begin in the Wood River country and extend to Coeur d'Alene. All that country on this belt lying between Sawtooth, in Alturas county, and Perce City, in Nez Perce county, is unexplored, and the time cannot be far distant when great riches will be unearthed from many parts of it. The districts that have attracted marked attention during the past year are the Wood River, Lost River and Coeur d'Alene.

The Wood River district is proving equal to the expectations of the most sanguine, and it is now generally conceded to be the richest silver-lead producing country in the world. The general average of the ores assays 143 ounces of silver and 63 per cent lead to the ton. This and the strength and number of the veins are sure indications of the great wealth of the district. In all cases the ore has steadily increased in value as depth has been attained, and the opinion largely prevails among men of acknowledged capacity in this branch of industry that, owing to the continuity of the ledges and the extreme width of the mineral belt, there will eventually be as deep mining in Wood River as in any other mining country in existence. The Bullion is the greatest belt in this locality, being from three to eleven miles in width, and has been explored from Bellevue to Smoky, a distance of thirty-seven miles. The next belt in importance is the Elkhorn. It extends from the East Fork of Wood River to Lake Creek, some nine miles. There is also the Muldoon belt, running from Muldoon to East Fork. The formation on the northeast sides of these belts is a granite porphyry, and on the southwest sides porphyry.

The veins occur in a metalliferous line shale, which is an easy guide to the practical miner. The output for the year ending June 30th was about $4,000,000.

SALTONA SALT WORKS.—In a conversation with Mr. R. R. Macleod, Assistant Engineer of the Southern Pacific Railroad, Monterey division, he gave a glowing description of the most extensive and valuable saline deposit, in the great Colorado desert, to be found in the United States, if not in the world. In addition to the great deposit or formation of crystallized salt, which is almost pure, there is an inexhaustible submerged lake of clear brine, which is en irely free from iron, sulphur, or any other impurities that sometimes require an expensive process of refining. The company are now erecting vats for the evaporation of the brine, which ranges from 24 to 30 per cent pure salt. No artificial heat will be necessary for evaporation, as the mean of the thermometer at that point in summer is 100 degrees, which is sufficient for all purposes. It is proposed to erect works for calciuating and reducing the finer article for table use in this city. Mr. Macleod says that salt from this great field, or submerged lake, can be delived at the reducing works in Arizona, or this city, for less than one-half the price now paid, and at the same time furnish a superior article. Mr. G. W. Durbrow, who goes down to superintend the work of opening up this mine, goes prepared to make an excellent improvement, which will turn out enormous quantities at a nominal cost.—*Los Angeles Herald.*

The Steamboat Mines.

Cinnabar, Copper and Native Alumnite.

Last Sunday, Judge Henderson, Frank E. Fielding, J. M. Quimbie and others took a trip over to Steamboat Springs, and paid a visit to the party of United States Geologists, now engaged in making a special survey of that strange region. The geologists are making a critical examination of a section of country about four miles square. Although much of great interest is to be found in and about the active springs, some curious deposits of minerals are to be seen in the burned-out ground which extends to a great distance on all sides, particularly to the west and south. In the vicinity of the extinct springs are to be found great deposits of sulphur, copper, cinnabar and other metals and minerals.

The Quicksilver Mine.

The party from this city paid a visit to the quicksilver mine of J. B. Dazet & Co., and brought back with them many beautiful specimens. The cinnabar shown is of excellent quality, and is procured quite near the surface. With proper apparatus this ore can undoubtedly be worked to a profit. It can be mined very cheaply, and the cost of extracting the metal from the ore should not be great, as there is in the vicinity an abundance of fuel.

Even now, at the active springs, cinnabar is to be seen in process of formation, but there the quantity is not so great as to the westward about the extinct springs, where the ore was deposited in cooler ground. The whole tract appears to be filled with ore and minerals, and some of the deposits are undoubtedly of great value. There are large deposits of carbonate of copper in the same place where the quicksilver is found, and near at hand are large beds of sulphur.

Sulphate of Alumina.

On the claim of Dazet & Co., our party made the discovery of a great deposit of native alumnite, or sulphate of alumina mixed with silicate of alumina. In regard to this deposit Mr. F. E. Fielding, the well-known assayer of the Consolidated Virginia office, furnishes the following: Native aluminite, or sulphate of alumina, exists in Washoe county, Nevada, in large deposits, and up to the present time I believe I am the first one who has made a thorough examination and chemical analysis of this now valuable mineral.

Properties and Uses.

Sulphate of alumina, when mixed with sulphate of potassa, yields alum, and this is a salt of extensive use in the arts, especially for the preparation of mordants, employed by the dyer and calico printer.

The Metal Aluminium

Is obtained on decomposing the chloride of aluminum by sodium. At a high temperature intense ignition ensues and the residue—aluminium—forms metallic globules in the midst of the chloride of sodium, which is removed by water.

The metal aluminium is bluish-white, malliable and ductile, of about the hardness of silver. But under the same bulk it has only about one-fifth of the weight of silver. This metal is now largely manufactured in the United States, at Philadelphia. Its lightness is a great recommendation, and it is now much used for ornamental and other purposes, especially for the small scale weights used by assayers and chemists. Being very light in bulk, it offers a much larger surface for manipulation with the piucettes or tweezers.

Samples of this mineral were brought to this city, and in appearance resembles decomposed alabaster. It seems to be very pure. Samples will be sent to State Mineralogist Hanks, of California, and perhaps to some other scientist of that State.—*Virginia Enterprise.*

Clifton's Bullion Output.

The total bullion output of the Clifton district for the month of November, 1884 was, in round figures, 1,140,000 pounds of black copper, divided between the two companies as follows: Arizona Copper Company 640,000 pounds; Detroit Copper Company 500,000 pounds. The average fineness of the first named is 97½ per cent, and of the latter 98 per cent. The Detroit company are running but one furnace at present, a 90-ton Fraser & Chalmers water jacket. As the furnace was "blown in," but 26 days their average output was over 19,000 pounds daily. The Arizona company expect to blow in additional furnaces the latter part of this month, or as soon as the cars are running to their mines on the western slope of Longfellow hill, when their output will be largely increased. At present they are running three furnaces, two 30-tons and one 60-ton of the Fraser & Chalmers make.

The Detroit company has recently completed a system of 7,200 feet of 20 inch gauge railroad by which its mines are now directly connected with the reduction works. The cost per ton for hauling ore is now trifling. In the future, during wet weather there will be no lack of ore, on account of the bad condition of the roads, as the little six-ton locomotive will glide over the iron rails as smoothly in wet seasons as dry.

A pipe line is now being laid from the tanks of the Detroit Copper Company, over to the Longfellow mine. As soon as it is completed the water supply at the mine will be from the San Francisco river instead of from Chase creek which has a copperish taste, and color, and is certainly not healthy. *Clifton Clarion.*

MECHANICAL PROGRESS.

A New Process for Toughening Steel.

The French Societe d'Encouragement have had under prolonged examination a process invented by M. Clemandot for working steel. This process is described by the *Revue Industrielle* as consisting in heating the metal until it acquires a sufficient ductility, and then subjecting it to high pressure during cooling. In this way a modification of the structure of the metal is produced, and the material acquires properties analagous to those developed by tempering. It is admitted that the compression of steel has already been practiced in England by Whitworth, but, it is contended, merely with a view to prevent air holes caused by the development of gaseous bubbles during the solidification of the steel. Similar processes have been tried in France, but only upon the same principle—that is to say, by operating upon the metal while yet in the state of fusion. M. Clemandot, on the contrary, takes steel already made, heats it simply to a chorry red, and submits it, by means of a hydraulic press, to pressures of from 1,000 to 3,000 kilos per square centimeter. After having allowed the steel to cool between the two plates of the press, it is withdrawn with all its new qualities perfectly developed, and does not require any further treatment. The result of the process is to impart to the steel a fineness of grain, a degree of hardness, and a notable accession of strength to withstand rupture. This alteration is most considerable with highly carbonated steel, and in this respect the metal is made to resemble tempered steel, without being in all points identical with it. The cause of the alteration in physical condition is ascribed to the rapid heating, and no less rapid cooling, of the metal. When the red-hot steel is first strongly compressed, the conversion of the mechanical energy into heat serves to raise the temperature of the entire mass, at the same time that the particles of the metal are more closely cemented together. This effect is followed by a rapid cooling, due to the contact of the plates of the hydraulic press with the surfaces of the metal. The close pressure materially increases this conducting effect of the cold metal.

Wire Cutting—A Convenient Tool.

There are jobs in which the treatment of wire in short lengths is requisite, which require that the wire should be cut as even as possibly, that is, that the end cut should be square. In all usual methods the wire is held rigidly and immovable, while a downward or a swinging cutter severs the material. It is rare that a wire or small rod can be so cut without leaving the wire with jammed-in ends or a cross section like a squeezed lemon. It is evident that for many purposes it is desirable that sections of wire should be cut off square. This can be done. It is done by a machine similar to that which severs bars of steel and iron—by a turning tool or its equivalent. But such a machine is costly, and can pay for itself only where much of such work is required.

But a handy tool for squarely severing wire, so as to leave the ends square, can be made in any machine shop, on the principle of a rolling cut. The reason why a wire, or any other rod or bar of iron, is compressed when cut cold, is because the action of the cutters is that of shears—two inclined planes, acting in the same line, horizontal or vertical. If one blade was fixed and the other rotary, there need be no compression of the rod or wire that passed between them; the rotary cutter would simply mark a circumferential line, to which the fixed cutter would respond by deepening it.

A very simple implement may be produced in the shop for this purpose, capable of cutting rods from one-quarter of an inch diameter to any size of wire. A steel blank of T form may be forged, the dependent or lower portion of the T to engage with the jaws of a vise, or be seated in a bench. In the other portion should be drilled a series of holes to fit the sizes of wire to be cut, all the holes on a line—horizontal—and another hole at the end of them to receive a bolt to hold a lever. The lever should be of steel at its acting portion, and both it and the standard be ground, and hardened, and tempered. But the lever should have at its pivot end a curved slot to engage with a fixed pivot in the standard, so that when brought down on the rod or wire it would slide over it, inducing a rolling of the rod or wire, cutting a score entirely around it before being "brought up" by the end of the curved slot against the fixed pivot or stud. The curve of the slot can be easily calculated, so that the cutting off action will suit all diameters within a range of from quarter-inch to No. 6 wire, or even much smaller.

ACCIDENTS IN PUTTING ON BELTS.—A writer in a mechanical paper, discoursing of accidents from running machinery, makes the following pertinent remark as to a preventable class of accidents: "One great fault, and one that causes numerous accidents with many workmen, is the manner in which they attempt to put on belts while pulleys are under motion. More people get caught in belting by attempting to do this than in any other way. I have seen men on a ladder, trying to put on a 10-inch belt, running at high speed, crowding the belt against the pulley, and burning it as well as their hands, and finally having to give it up as a failure; then they had the speed decreased, and the belt put on without any trouble. There is nothing that agitates my nervous system more than to see some one attempt to put on a belt, standing on the wrong side of the pulley. The right place is to stand on the opposite side of the belt, putting it on as it travels toward you. Having a good foundation to stand on, take the belt in hand, and lead on to the pulley, moving the hand as fast as the pulley travels. This is the whole secret. I have seen a little fellow, who understood this principle, go to a large belt that three men were tugging at, and easily put it on the pulley at first trial."

Does Vibration Affect the Balance of Machines?

"A machine is said to be in balance," says the *Mechanical News*, "when it moves harmoniously and without visible vibration, but this occurs only at certain speeds. That is to say, a machine balanced for one velocity will be out of balance at others. The causes of this are obscure, aside from centrifugal disturbance, and many good observers confess their inability to discover it.

"The relative velocities of moving parts of a machine remain the same at all speeds, but the relative vibrations do not. At certain velocities the connecting rod of a steam engine transmits the power without vibration or jar, but urged faster it trembles visibly.

"These vibrations do not occur in equal times, but are greater or less according as the rod is approaching or leaving the center, and when it is pushing the load or pulling it. Circumstances also affect the vibration. This want of synchronism affects the balance, in that it transfers the jar of the vibration to the moving parts in unequal times. Vibration is not a force, but is an action caused by it, and is undoubtedly a disturbance to harmonious motion.

"Again, it is an oft-stated point that a reciprocating mass cannot be balanced by a rotating mass. If this is true, what becomes of the notorious fact that engines of all kinds move in equal times, as far as we can see? They do not show any want of balance, though cast loose from fastenings and held down only by their weight. An engine out of balance should give evidence of it by horizontal motion (supposing it to be a horizontal engine) of the bed-plate on its supports. Engines, when run at certain velocities under such circumstances, sway the bed-plates to and fro, but at higher speeds remain stationary. What has counteracted this tendency when they remain motionless? Has not vibration entered into the question, and by its infinitesimal swaying of masses—like the beats of a pendulum—acted as a balance?

"Our argument is for and against; we do not know what causes the disturbances and erratic action mentioned, but it would seem that the vibration of masses of metal at certain velocities may affect the balance of machines in a marked degree. We do not allude to mere tremor, but to visible movement. Even the former may have its influence when large masses are disturbed."

The vibration or visible movements of a machine have nothing to do with the balancing of the running parts. On a rotating mass the connecting rod is just as much out of balance, proportionately, at one speed as at another, only its time of action differs materially with the synchronous movements of the bed-plate on its supports. At a given speed the inertia of the reciprocating parts acts in harmony with the vibrating wear of the engine and helps at every movement. At a greater or slower speed many of these effects of inertia are applied to check these visible movements, as they take place at an instant when they are of no use to keep the bed in motion on its foundation. A reciprocating mass cannot very well be balanced by a rotating body, but can be equalized at least in one direction, and where the movements are to be guarded against, horizontally, the unequal effect should be left vertical and bring the hammer blow on the supports similar to that of the wheels of a locomotive on the rails, then there will not be felt any of that shake to the building when the machinery is in one of the upper stories.

A NEW METHOD OF PRODUCING PAPER PULP.—A more economical method of producing paper pulp is claimed to be realized in the use of a new and ingenious machine, by which the wood is shaved off so finely that it is ready to go at once into the boiler. The machine takes a log twelve inches in length, which it revolves at a speed of one thousand revolutions per minute, and a sharp cutter shaves off a shaving so thin that it would take 750 of them to make an inch, a nicety of execution which may be judged of by the fact that two hundred sheets of ordinary paper are required to make an inch. The knife has a sliding motion, and gradually moves forward as the block decreases in diameter, and in order that it shall not become dull and the filer consequently be of uneven thickness, there is an ingenious arrangement of whetstones constantly at work on the knife.

SCIENTIFIC PROGRESS.

The Direction of the Wind.

That the changing of the direction of the wind is due to the shifting of the situations of greatest heat on the earth is substantially proved by the fact that in certain regions of the terrestrial surface, where the situations of the greatest heat and cold do not alter the direction in which they lie to each other, the wind does not change, but always blows in the same direction from one day to another, and all the year round. This occurs in the great open spaces of the ocean, where there is no land to get heated up by the sunshine of the day, and to get cool by the scattering of the heat at night. In those spaces, for a vast breadth of many hundreds of miles, the sun shines down day after day upon the surface of the sea, heating the water most along the mid-ocean track which lies most immediately beneath its burning rays as it passes along from east to west. This midway track of the strongest sunshine crosses the wide ocean as a belt or zone that spreads some way to either side of the equator. Throughout this midway track the cooler and heavier air on either hand drifts in from the north and from the south, and then rises up, as it becomes heated by the sun, where the two currents meet.

In both instances, however, in consequence of the spinning round of the earth, the advancing wind acquires a westward as well as equatorial drift. The air current, as it approached the midway equatorial zone, where the onward movement of the sea covered surface of the earth is performed with the vast velocity of 1,000 miles an hour, does not immediately acquire this full rate of speed, and lags back upon the ocean, so that it appears as a drift toward the west as well as toward the equator. On the north side of the equator the wind blows all the year round from the northeast, and on the south from the southeast, both in the Atlantic and Pacific Oceans. These steady and unchanging ocean winds are called the trade winds, on account of the great service they render to ships carrying merchandise across these portions of the sea. In sailing from England to the Cape of Good Hope, through the entire length of the Atlantic Ocean, ships, before they reach the equator, have to pass over a broad space where strong winds are always blowing steadily from the northeast. That is the region of the northeast trades. They then traverse a space near to the equator itself, where the northeast winds cease to blow, and where the air is very still and calm, and they afterward come to a region to the south of the equator, where strong winds are continually blowing from the southeast. That is the region of the southeast trades.—*Science for All.*

Purification of Water by Motion.

A discovery has been made by Dr. Pehl, of St. Petersburg, which promises to have a very important hearing on many industrial processes. The water of the river Neva is very free from bacteria, having only about 300 germs in a cubic centimeter. The canals of St. Petersburg, on the contrary, are infected with bacteria, their number reaching 110,000 in a cubic centimeter, even during good weather. The same is true with regard to the conduits of water for the supply of the city. While the chemical composition of the water passing through these city conduits hardly differs from that of the Neva (by which they are supplied), the number of bacteria reaches 70,000 against 300 in the water freely taken from the river; and the worst water was found in the chief conduit, although all details of its construction are the same as in the secondary conduits. Dr. Pehl explains this anomaly by the rapidity of the motion of the motion of the water, and he has made direct experiments in order to ascertain that. In fact, when water was brought into rapid motion for an hour, by means of a centrifugal machine, the number of developing germs was reduced by ninety per cent. Further experiments will show if this destruction of germs is due to the motion of the mass of water, or to molecular motion. If this discovery of Dr. Pehl's be confirmed, it will become possible to destroy bacteria, and render a water comparatively pure, simply by passing it through a centrifugal machine. The subject is of special interest to brewers, who suffer, perhaps, more than any other manufacturers from the attacks of bacteria.

Uses of Arctic Explorations.

In 300 years there have been some 200 Arctic voyages for various purposes and with various fates. The Greely expedition was but one of thirteen expeditions. Five hundred men passed two winters within the polar circle, and nineteen of them only were lost. And Lieutenant Ray says that the result of all these expeditions will be the doubling of the world's knowledge of the magnetic forces. That is to say, as the Rev. Brooke Herford states in his admirable sermon upon the subject: "Not one of all the thousand and ten thousand craft sailing to and fro among the lands of earth but will be a little surer of its compass, a little closer in its reckoning, a little safer than it ever was before."

Is this worth nothing? Is not the risk, the loss even, amply recompensed? But also, as Mr. Herford points out, the moral qualities, the patience, the courage, the self-denial; the faith, the endurance developed by these northern researches are incomparable. "There is no other chapter in the history of human doings to be compared with it. Beside it the adventures of commerce and conquest look greedy and base, the stories of chivalry are mere tinsel, the long heroism of the crusades seems a fevered frenzy. *Cui bono?* is not an argument to discourage the reckless soul, which the prospect of peril inspires, nor will the pathetic story of patient and generous endurance, amid apparently remediless suffering, which the record of the Greely expedition discloses, dismay or deter other Greelys from daring the same dangers."

A NEW HYDROCARBON MINERAL.—A new mineral hydrocarbon has recently been discovered near Seefeld, in the Tyrol. It occurs crudely in the form of a bituminous rock, of peculiar constitution; and the bitumen is believed to be composed of the decomposed remains of prehistoric marine animals. Treated with strong sulphuric acid, the bitumen yields a soft substance, which when neutralized is not unlike vaseline in consistence, but resembles coal tar in color. It differs from all known vegetable and mineral tars, however, by its odor, and by the possession of peculiar physical properties. It forms an emulsion with water; and is partly soluble in alcohol and ether. A mixture of these two liquids completely dissolves it. It is miscible in all proportions with vaseline and oils. The name "ichtyol" has been given to the substance, which is characterized above all by its richness in sulphur, of which it contains about 10 per cent. This element is so intimately mixed with the ichtyol that it can only be separated by the complete decomposition of the latter. Besides sulphur, ichtyol contains oxygen, carbon, hydrogen and traces of phosphorus. In consequence of the high proportion of sulphur, the new hydrocarbon is regarded hopefully as a medicament or unguent.

THE EFFECTS OF LIGHTNING STROKES ON HUMAN BEINGS.—A paper was read by Harr Heusner at a recent congress of German medical men, held at Magdeburg, on the effects of lightning stroke on human beings, and the author showed that when the lightning discharge passed through the skin, its passage was much easier, that is, the internal organs are much more conducive than the epidermis. If this was known, it was not so well known that the brain and spinal cord are apparently conductors, and that a lightning stroke on the head, does not materially injure the brain beyond shattering the nerves and causing temporary derangement. Most persons struck by lightning, do not remember anything about the stroke; but others describe a sensation such as would be caused by their being struck by a heavy blow, and some have likened the shock to what they would be supposed to feel if torn into small pieces. Engineering says the subject is now happily beginning to engage the attention of physiologists as well as physicists.

PREPARATION OF MAGNESIUM.—A process patented by Gratzel, for the separation of alkaline metals by electrolysis, has been very successful in the reduction of magnesium. In Berlin there has recently been exhibited, as a product of this process a ball of pure magnesium, of about five inches diameter. It was exceedingly brilliant, closely resembling silver; and had lost nothing of its luster since its separation. This preservation from corrosion is a sign of the high degree of purity of the metal, and forms a striking contrast to the magnesium hitherto obtained, which was always more or less alloyed with potassium, and consequently easily oxidized, especially in a damp atmosphere. The purer magnesium is considered to be destined to increasing maritime use, because the rays of the magnesium light appear to have a greater penetrative power in fogs and mists than the electric arc.

THE CHEAPEST ANTISEPTIC.—M. Pasteur anticipates that bisulphide of carbon will become the most efficacious of all antiseptics, as it is also the cheapest, costing but a fraction of a penny per pound in large quantity. It is also the best insecticide known, and for this purpose may, perhaps, be useful to preserve wood-work in tropical countries. Some idea of the use it is already put to may be gathered from the fact, that over eight million pounds of the substance are used annually to check the ravages of phylloxera. Carbon bisulphide, as produced, is about as foul smelling a compound as is possible to find; but it is capable of purification till all offensive odor is removed, and it is sufficiently pure in smell almost to mix with a perfume.

IDUNIUM.—"Idunium" is the name proposed by Professor Wehsky for the metal just discovered by him as one of the components of native vanadate of lead. The mineral is rather a scarce one, of a yellow color, and contains several other metals, of which zinc, iron and arsenic are among the most prominent. Idunium resembles vanedine in several respects, both physically and chemically, while the only oxide hitherto examined, forms stable salts with alkaline bases, and thus would appear to possess distinctly acid properties.

Passing Events.

The weather all over the State has been exceedingly cold for the past few days, and much snow has fallen. The effect has been to retard operations in many places.

The State Legislature will convene at Sacramento on Monday next.

There is considerable talk over recent gold discoveries in Lower California of late, but the country is so dry that it is difficult to do much unless the ground is very rich. A five-stamp mill was sent down from this city to some new mines in Lower California last week. Water is to be brought in a flume to work the mill.

The MINING AND SCIENTIFIC PRESS commences a new volume with this number. We expect to have a large number of illustrations of mining and metallurgical appliances in this volume, all of which will be of interest to miners and millmen.

COPPER was never so cheap as now. The present price is about 12½ cents a pound. The old price, a few years ago, was 18 to 20 cents, and during the war it went up to 50 cents. Curiously enough, as the price of copper has gone down, the uses for it have increased, and hundreds of things are now made of cheaper metals, or not made at all.

Smelting in Adobe Furnaces and Refining in Mexican Vaso.

[Written for PRESS by A. GMEHLING, of Parral, Mexico.]

Smelting.

A person familiar with and reading of newly constructed smelting works, with their improved machinery and better mode of working, may find these few remarks and facts about the reduction of ores, as carried on in many places in Mexico, worthy of some attention, they being descriptive of a method, so exceedingly simple, crude and imperfect, as can possibly be imagined.

The place I have reference to has three adobe blast furnaces, and one cupellation hearth in operation. The blast furnaces are very simple in construction, and built out of adobes. They have one tuyere each, which is fitted into a copper box, which is to substitute the water jacket. It is open against the outside and cooled by the air, the copper, however, occasionally melting off. The box is 32 inches high, 24 inches broad, 6 inches in depth, and 1 inch thick. The center has a 3-inch wide round opening to take up the tuyere. This copper box forms the lower back of the furnace. The profile of the shaft is square, 2½ by 1½ feet, and the furnace is, from the lead tap to the top, 8 feet high. The tops of furnaces are open and the fumes are discharged through it into the hoods, which shelter the furnaces. A stair leads to the open top. The necessary blast is supplied by a No. 7 Sturtevaut blower, the motive power being an eight horse-power turbine. The wind pressure amounts to 2" water, although 4" would be required.

Different kind of ores are delivered at the works. They are mostly carbonates, nearly self fluxing and easy to smelt and contain some arsenic and antimony. They average between 20—30 per cent of lead, 25—35 ounces of silver, .25 ounces of gold per ton of 2,000 pounds. Each charge was made up of (that is, during my presence) 900 pounds of ores, (assaying 30 ounces of silver, .25 ounces of gold, 23 per cent of lead) 225 pounds of litharge, skims, cupelling hearth (assaying 60 per cent of lead, 5 ounces of silver) 200 pounds of old Mexican slag, (assaying 8 per cent of lead, 5 ounces of silver).

The fuel is exclusively charcoal (oak) and costs $8 per ton. One hundred pounds of charcoal will smelt 350 pounds of charge. Each furnace requires three men per shift of 12 hours, namely: one smelter, one feeder and one slag man. Each furnace works 5 of these charges in 24 hours, or 6,625 pounds. The bullion is tapped off as soon as one charge went through the furnace, and each tap delivers on an average 225 pounds of lead-silver bullion. The bullion flows into the sand on the floor and is covered with fine dust and taken out in one cake after cooling.

During 10 days 3 of these furnaces smelted 150 charges and produced 32,850 pounds of cake bullion. After resmelting in the cupellation hearth, 3,400 pounds of dross and 3,250 pounds of scum were drawn and 28,200 pounds of clean bullion obtained, which assayed 101 ounces of silver and 1 ounce of gold to the ton, the dross consisting principally of oxides, mixed with dust, slag and metallic lead, assaying 35.30 per cent of lead, 12 ounces of silver per ton; while the scum is chiefly composed of the oxides of lead, antimony, arsenic, etc., mixed with dust and slag and showing the same assay. According to given assays 150 charges contain:

	Lbs. of Lead.	Ozs. of Silver.	Ozs. of Gold.
	53,700	2,184	16.80
Bullion, dross and scum yield:			
Bullion.....	28,059	1,424.10	14.10
Dross.....	1,200	20.40	.....
Scum.....	1,150	19.50	.....
Total.....	30,409	1,464.00	14.10
Yield of ores and fluxes..	53,700	2,184	16.80
Returns.....	30,409	1,464	14.10
Loss.....	23,291	720	2.70
Loss in percentage.....	43 37	32.96	16.07

The slag obtained is clean from metallic lead and thrown over the dump. It assays from 4 to 5 per cent of lead, 2—3 ounces silver per ton. There is with every tap a small amount of arsenical speiss drawn, which comes immediately back to the blast furnace.

During the whole process of working 150 charges, the amount of slag received figures approximately at 60 tons. The average assay of same will be 4.5 per cent of lead and 2.50 ounces of silver to the ton. According to this data we find that 5,400 pounds of lead and 150 ounces of silver were carried off by the slag, while 17,891 pounds of lead and 570 ounces of silver went off with fumes and smoke into the atmosphere. Or, expressed in figures, we must acknowledge that 43 37 per cent of lead, 32.96 per cent of silver, 16.07 per cent of gold were lost during the entire smelting operation and from these losses in lead and silver:

	Lead.	Silver.
Were lost in the slag.....	23.18	20.83
Went off with the fumes.....	76.82	79.17
Total.....	100.00	100.00

Refining or Cupelling.

The refining of the lead-silver bullion is carried on with very primitive appliances. A more imperfect and cheaper cupelling hearth can hardly be imagined, although the losses of silver and lead are, comparatively speaking, not very heavy. Inside of 24 hours the hearth is built up under contract, costing $3. The foundation is about 18" thick and the hearth tamped upon it out of a mixture of three parts of wood-ashes and one part of clay. Six by four feet are the dimensions of the hearth, and the fire-place is 18" wide and 6 feet long. After charging the furnace with about 20,000 pounds of bullion the hearth is arched in an extremely simple way, by laying adobes loosely upon each other and patching up the cracks with clay. The furnace has no connection with any chimney or flue-chamber, and fumes and smoke are discharged in the same manner as by the blast furnaces. As soon as the lead charged is melted the balance of same is added. Commonly, 26 hours will pass before the dross and scum are drawn, and from now four days more are required before the silver is fine, the fineness reaching mostly 950. The cupelling hearth is heated by the branches of the semma plant, and cost $6.25 per 24 hours. Two men per shift can do the work with ease. The silver cools in the furnace and is taken out in one piece.

The cupelling of the 28,200 pounds of lead-silver bullion was done with the following results: Received 1430 ounces of silver-gold bullion, 950 fine; 12 175-2000 tons of litharge, assaying 90 of lead, 2 ounces silver per ton; 2 375-2000 tons of lead hearth, assaying 60 of lead, 12 ounces of silver per ton. The 1430 ounces of silver-gold bullion contain:

	Ounces.
Gold and silver.....	1,358.5
Gold (exclusive loss).....	14.1
Silver, ozs.....	1,344.40
Silver in bullion.....	1,344.40
Silver in litharge.....	24 30
Silver in lead hearth.....	28.50
Total.....	1,397.20
	Pounds.
Lead in litharge.....	21,915

Loss in ounces.....	26.90
Loss in percentage of silver, 1.88	
	Pounds.
Lead in bullion.....	28,059
Lead received.....	24,765
Loss in lbs.....	3,294
Loss in percentage of lead, 11.73	

Russian Mines.

We had an interview this week with Mr. Michael Schostak, a Russian mining engineer, who is making a tour of the gold mining regions of the world in the interest of his Government, with the view of obtaining improved appliances for working Russian gold fields. He has spent several months in Australia, and will remain in California some months, visiting our mines. He is more particularly desirous of inquiring as to our system of working gravel deposits, both by drift and hydraulic process. It is his intention to take back to Russia complete outfits of the appliances in use in these mines, and these things will be purchased in San Francisco. He will also examine our system of quartz mining and the machinery connected therewith.

Mr. Schostak gave us an idea of the method of working gold mines in Russia. Among other things, he says they are not allowed to lose in washing gravel more than a certain percentage. The mines belong to the Government, and those persons who lose more than 5 per cent are, after the first year, compelled to pay a fine of 500 rubles; if it occurs a second time, the fine is doubled; and for a third offense they are prohibited from mining. Government inspectors periodically visit the mines and make the necessary test of tailings, etc. Such a system grafted on to our mining customs would be rather hard on some of our superintendents and companies.

Mr. Schostak has been for some seven years past in the Nertschinsk mining district, in Eastern Siberia, some 4,000 miles from St. Petersburg. These are private placer mines, belonging to the Emperor. They are not very rich, not averaging more than two to four drachms a ton. The mines throughout Siberia are generally worked by free miners. There are about 20 or 25 different mines in this district, in only one of which are convicts employed, about 4,000 of them being worked in the Kara placer mine. Miners are not paid by the day, as in this country, but by the cubic yard, at the rate of 20 cents a yard. They usually make about 60 cents a day. Their work consists merely in carting the sand to the puddling machines, which are similar to those used in other placer mining countries, but in some respects better. They are of large capacity. The convicts are paid the same wages as the others, their money being paid into the treasury of the Minister of the Interior. They are usually men who are serving sentences from two to twenty years, and at the expiration of that time they are paid 15 per cent of all they have earned during their imprisonment. After they become free they are still compelled to remain in Siberia, and receive this compensation to assist them in beginning their new life outside the prison walls, being granted in addition a portion of land, usually amounting to four or five acres. The Minister gets the same pro rata of wages as is paid for free labor, but the convicts never earn as much as the others, from the fact that they lack the interest which urges the free man, the latter generally earning five times as much.

Within a few days news has been received, and confirmed by the Russian Consul in this city, that the Emperor has decided to commence the building of a system of railroads throughout Siberia. This will bring the mines into direct and closer communication with the large cities and more settled communities, and will result no doubt in bringing in more capital and a great many people. The great drawback has always been the insufficiency of labor. At present it consists of the mere handful of peasants and convicts, the former being mostly descendants of exiled prisoners. There are no foundries, and the expense of bringing machinery across the mountains is so enormous as not to be thought of. There are plenty of gold mines which have not yet been tried or tested. With improved California processes, instead of the slower ones now in vogue, many of these fields would be made to pay.

Mr. Schostak intends recommending to his Government to buy the machinery in San Francisco. California possesses facilities for shipping unequaled by any other place where machinery is extensively built. It can be sent all the way by water direct to Nertschinsk. At Yokohama a change of steamers will probably be made, and thence to Nikolaevski, at the mouth of the Amoor river. This river is always navigable from April to October, and the distance of 2,000 miles on the river to Nertschinsk can be accomplished in three weeks. This place is the most important district in the country. Already several new mining places have sprung up along the river, and the importation of machinery will give the mining industry a strong and refreshing impetus.

The mines are so far removed from the Russian capital and the other commercial and money-eyed centers, and the mode of travel so rough and limited, that few care to risk investment at such a distance. The companies usually consist of six or eight men, and there is no issuing of shares of stock as in this country. They are usually men who began mining work on a small scale, and who have gradually grown wealthy. Only free labor is employed, and, as a rule, private enterprises do not care to furnish convicts with work at the expense of the free men. In staking claims, locators are allowed to take up ground three miles in length, and the width of the valley, the distance between the mountains varying from one-half to two miles. Where discoveries are made, each name is entitled to take up such an extent of surface. This refers entirely to placer mining. So little has been done in the discovery of lodes that nothing looking to regulating such locations has been deemed necessary. The restrictions placed upon foreigners are limited.

The Separation of Strata in Folding.

At a recent meeting of the American Institute of Mining Engineers, the following paper by Fred G. Bulkley of Leadville, Colorado, was read:

That portion of the geological structure of the Leadville district which rests upon the Archæan is made up of sedimentary beds of Siluriau and Carboniferous formation, consisting of many conformable strata of limestones, quartzites, and shales, which have a total present thickness of about five thousand feet. Interbedded with these strata are found, under somewhat fixed laws of regularity, sheets of intrusive igneous rock, varying in thickness from a foot or two to several hundred feet. These consist for the most part of various types of felsite rocks, classed, by the sanction of common and long-continued usage, under the general term of porphyries.

The region here under discussion is made up of a series of great geological folds, the result of dynamic force applied "tangentially to the surface of the earth and in a direction at right angles with the axes of folding," as explained by the generally accepted theory of contraction advanced by Descartes, De la Beche and others, and discussed by more recent writers on geology.

In a study of this feature of the formation, together with the fact that the intrusive igneous sheets are found interbedded with the pre-existent stratified rocks, may be found the material for a theory which will perhaps explain the conditions under which the fused stream of porphyry might have found its place, without discussing the possibility of an upward pressure in the mass itself, sufficiently great to pry open or lift the weight of the superincumbent beds. A formulation of this theory is:

The result of the application of tangential pressure upon rock-beds will be not only a folding or plication of the beds, but also a tendency to separation in places of the strata composing them.

This may be nicely illustrated by the experiment of pressing together longitudinally one hundred pages of any volume, or as many sheets of paper laid flatly one upon another. In geological folding the principal remains the same, and its application is attended by a like result. In the latter case, however, gravity becomes an important factor.

In Fig. 1 an ideal anticlinal fold is represented, produced by the horizontal pressure, P P, which force is exerted longitudinally throughout the anticlinal, and its direction is everywhere tangent to the curve of the fold. Thus the resultant P′ P″ of this force, as applied at O and O′, shows an uplift equally applied to all the strata, which is consequently exerted with increasing effect upon the uppermost sheets, thus causing a tendency to separation of the strata. The force of gravity is represented by G O, G O″; and it is evident that at the summit and at the foot of the anticlinal, as at O O, this whole force is exerted in a direction at right angles with the bedding-planes of the structure, its whole effect being exerted to prevent a separation of the strata, while at other points, at midway between the foot and summit, at O″, the force thus exerted is much less. A mathematical analysis of the force of gravity at this point shows that the force exerted at right angles to the planes of stratification is directly proportional to the cosine of the angle of dip, and is represented by G′ O″. This, of course, remains true for all points between the foot and summit of the fold. Thus the weight of a thickness of 10,000 feet of sedimentary rock may be estimated at about 875 tons per square foot, which pressure will be exerted at the summit and foot of the anticlinal to prevent a separation of the strata, while if the angle of dip at O″ be 60°, the force thus exerted at that point will he but 437.5 tons, so that at the point or line of greatest dip will be the greatest separation of the strata. As a result there will be created fissures or cavities, widest at the point of greatest dip, and thinning gradually towards the foot and summit, whose extent, vertically and laterally, will depend upon the extent of the folding and upon the thickness of the superposed beds. That the eruption of porphyry at Leadville occurred contemporaneously with and incidental upon the folding is altogether possible (such a theory being borne out by the absence of intrusive sheets in untilted strata); and in the presence of such pre-existent fissures it would naturally fill the latter with its fused mass, and probably, to a great extent, enlarge them, as any upward pressure in the mass itself would most avail where the pressure of gravity is least. This theory gains strength from some corroborative facts revealed by an examination of certain beds of limestone in this region which have been greatly involved in the general folding. In one locality a dyke of gray porphyry, having a thickness of about ten feet, cuts up nearly vertically through the lime-strata into an overlying sheet of older white porphyry. Near the point where the dyke passes up through the plane of contact of the two rocks, a fault of about ten feet in the lime strata is observed, which extends neither up into the porphyry nor for any considerable depth into the limestone below, where occur several bedded sheets of gray porphyry, from one to five feet thick, and of considerable lateral extent, injected from and forming a part of the mass of the dyke, as shown in Fig. 2. In this, *P* is white porphyry, *d* the dyke, *l* limestone, and *m* fault.

That the intrusion of the dyke material could have occurred under a sufficient pressure in the mass itself to render possible the creation of the crevices containing these thin lateral sheets, is rendered altogether improbable from a consideration of the small size of the dyke; and that the slight local fault existed before its intrusion is proven by the fact that the flow of the older white porphyry conforms precisely with the faulted surface. These crevices must, then, have existed previous to the dyke, and were naturally filled at the time of its injection. In another locality, on the slope of an anticlinal, successive crevices in limestone exist, from one to six feet thick, lying parallel with the bedding-planes, and filled with ochreous clay and limonite, carried in by and deposited from percolating waters. Here no connection exists with the vent or place of eruption of any igneous rock.

There exists but little room for doubt that the origin of the enclosing crevice of many metalliferous *bed-veins*, properly so called (in contradistinction from those *ore beds* contemporaneous in their epoch with and forming an integral part of the enclosing rocks), may be referred to a separation of the strata in anticlinal folding.

The Spar lode, of Pitkin county, Colorado, is a bed-vein occurring at the plane of contact between a bed of calcite above and a bed of dolomite below. Here, also, the formation consists of conformable sedimentary beds of the lower Silurian, lower, middle and upper Carboniferous, and Cretaceous epochs, with interbedded, intrusive, igneous sheets; and the vein in question is situated upon the westerly slope of a great anticlinal. It varies in thickness from 4 to 12 feet, and evidence that it forms the filling of a pre-existent crevice is found in the conditions illustrated by Fig. 3, viz., that, where they are not disintegrated, the uppermost strata of the dolomite are found contorted and folded in short, deep flexures, in local unconformity (*d′*), which could only have occurred within the space of a pre-existent fissure or crevice. In this figure, *c* is calcite, *d d′* dolomite, *v* vein material foreign to the walls. The Monarch vein, of Chaffee county and the Combined Discovery vein, of Eagle county, Colorado, present examples of similarly-formed crevices, enclosing bed-veins, on the slopes of anticlinal folds. In each of these cases, parts of the crevice remain entirely empty of vein-material or other matter, while, in the latter instance, a band of aragonite, now about eight inches thick, is still in process of formation upon the hanging wall.

FIGURES ILLUSTRATIVE OF SEPARATION OF STRATA IN FOLDING.

Round or Flat Hoisting Rope.

When the character of the rope to be used in hoisting works or mines is being considered it is well to have wide experience to judge from. Many persons still adhere to the idea that hemp is the best material for the purpose, although the steel wire rope has entirely displaced it in this country. Where heavy cages made to carry large loads and many persons are used only the very best quality of rope should be used. It is said that in Belgium, where the number of breakages of hoisting ropes attended with fatal consequences is about twelve a year in one province alone, in France, where there is twice the production, not a single accident has occurred from this cause in three years. Mr. Geo. J. Andre, the author of Continental Colliery Notes, attributes this partly to the excellence of the French ropes and the greater care with which they are used.

These two facts are sufficient to the account for much of the difference; but there is probably something in it due to the form of the rope. A few years ago the flat rope was in high favor in Europe. Papers were read and essays written to prove that in the flat form the component fibers of the rope are more equally strained than in the round form; and consequently that the former gave a longer duration and greater security. The acceptance of these views led to the adoption of the flat form generally in some districts, and in numerous instances in others. Experience seems, however, to have revealed error in these views, for we now find the flat form altogether in disfavor generally in England, though in some localities it is still in common use. But even in these cases it is being gradually abandoned. Whatever be the relative merits of the two forms, it is a remarkable fact that in Belgium, where breakages are numerous, flat ropes are used, while in France, where such accidents are extremely rare, the round form is universally adopted. The absence of accidents from the breaking of drawing ropes at the French mines is, moreover, a sufficient answer to those who maintain that steel ropes afford less security than hemp or aloe fibre.

ANTIMONY is selling in Liverpool at £40 to £42 per ton.

Miners' Lamps.

Some extended experiments have recently been made with miners' safety lamps at the Adderly Green collieries by English Government mine inspectors. The experiments were not made with a view to ascertain the highest velocity which lamps would withstand without passing the flame. Their purpose was to subject the lamps to such conditions as were more frequently met with in the mines than in the testing boxes, and about which there appeared to be but little information. The lamps which were tried were the following: Davy, Clanny, Belgian Mueseler, Marsaut, and (in part) Ashworth, Ford and Williamson. Experiments with the Davy showed that in almost quiescent gas it was possible for a gauze to become red-hot, and to remain so for nearly two hours without passing the gas flame to the outside. The experiments verified the assertions which had been made as to workmen formerly working with red-hot Davy lamps. It was found that with a velocity of 5½ ft. and more per second the Davy continually passed the flame after a few seconds, but that it withstood a velocity of less than 5 ft. per second in which the Clanny passed the flame.—Clanny: Like the Davy it was possible to keep the gauze red-hot for a lengthened time in almost quiescent gas without the flame being passed. It passed the flame at a lower velocity than the Davy, viz., 4.8 ft. per second.—Belgian Mueseler: That lamp was tried complete, and without the outer gauze, and in no single case was an explosion produced, or did the gas flame pass into the top gauze. In some of the experiments the gas flame continued to burn for some time after the lamp had been extinguished, and in certain trials, where the top gauze was removed, relighted the lamp flame. The gas flame invariably rotated round the tube below the horizontal gauze, at times at a very high velocity.—Marsaut: This was tried complete, and with its casting removed, but the flame was not passed. In experiment 5 the almost quiescent gas burnt within the inner gauze for a period of 99 hours and 25 minutes "as a will-o'-the-wisp," without any perceptible effect on the lamp. In velocities of 8 feet per second, when the casing was removed, both gauzes became red-hot; but the gas supply failing, a continuance of the experiments was impossible.—Ford: That lamp invariably became extinguished by its own production of soot.—Ashworth and Williamson: Those were also extinguished after a certain time, probably from an insufficient supply of oxygen. In several of the experiments glasses were cracked without any detrimental effect. Even where the cracks extended to all parts of the glass, the pieces were kept in their places by the top and bottom rings, and in no case allowed the flame to pass. This shows the necessity of well-fitting top and bottom rings. Glasses were cracked in a few experiments by the lamp being tilted at an angle of 45 degrees. In the Marsaut and Clanny, with an ordinary flame, the glass cracked after 30 secs. and 1 min. 55 secs. respectively, while the Mueseler was immediately extinguished. These experiments proved the danger from the Davy and Clanny in ordinary velocities, and tended to remove the idea that a fractured glass was invariably unsafe. In the course of a discussion which took place it was stated that the experiments tended to show that the Mueseler, with the tin case of the Marsaut lamp, was the safest.

THE Southern Utah *Times* warns miners in search of work to steer clear of Frisco. It says: "While the Horn Silver mine is the largest silver-lead producer of which there is any record, there are now in Frisco more than enough to work it. There are idle men here now, good miners, to whom the term tramp cannot be applied. Our climate is mild, and many miners from Northern Utah naturally drift south at this season for work. We have too many here now, and again warn miners to go slow."

OBSIDIAN is found in Inyo county. Some varieties of obsidian cut beautifully, and might be used for ornamental purposes, for paper weights, vases, bases of clocks, and similar purposes.

AT Calico, San Bernardino county, the town has now a population of over 700, and of this number there are some 350 miners at work. Some of the ore being extracted is very rich.

Noted Mining Localities.

When the Comstock lode in Nevada, a few years ago, was turning out her millions annually, every owner of a promising lode claim in Colorado would enthusiastically point out any real or fancied resemblance to the great Nevada producer. Since the Comstock has passed under a cloud and its production has been curtailed to insignificant proportions, no Colorado miner ventures to trace any points of similarity to that greatest of known mineral veins. The stockholders in the different claims on the great Comstock vein have been pluckily endeavoring to unearth another bonanza, and have been doing paid out in assessments instead of having in so years over $30,000,000. When began turning out their the past six croakers prophesied that Leadville mines be played out, be millions annually the only above that ere this they too would by the exhaustion of the ore deposits existing some line, must be quickly exhausted by the extensive exploitation given them. In instances this has been true, but it has never been found that these ore bodies were not confined to the narrow areas popularly ascribed to them, and that the lime floor was not the bedrock limit of their continuance. In the lime and below the lime mineral has been found, and the vacant spaces between great ore chutes have been exploited and other deposits encountered. No well-posted miner of that region now ventures to place a period to the capacities of that district in regard to yield of ore. The future of Leadville to-day is as full of promise as though hundreds of thousands of tons of ore and millions of dollars had not been wrested from those famous old hills. In Nevada and at Leadville miners are gleaning old workings and marketing thousands of tons of ore annually which a few years ago were not marketable. Improvements in milling and smelting methods, economy in management and the willingness to work for smaller profits can be noticed in both these famous sections. The enormous expense attending the exploration of the depths of the Comstock vein will at no distant day cause the total abandonment of the deepest workings unless a bonanza is soon encountered. Exploration at Leadville is not so costly, and hence her hills will be more thoroughly prospected, and as the area is so vast there is every reason to believe that this generation will witness no abandonment of any considerable portion of her territory. Low prices for silver and lead are the only methods of greatly curtailing Leadville's ore product.—*Denver Tribune-Republican.*

Mountain Gold.

A hasty glance at the showing which our banks make in the handling of gold and silver, says the Helena *Independent*, will convince the most incredulous that our surrounding mines are doing a splendid business. The thousands of dollars worth of gold and silver which flows through our banks makes so little noise and stir in the ordinary avenues of life that few have any idea of its extent. A common dray, delivery or beer wagon makes more noise and attracts more attention than the receipt and shipment of $100,000 worth of gold. The different effect of the two on the financial status of our city is too evident to all to need any extended comment. Unless one goes and inquires at the banks, he would hardly dream that 71 lots of gold dust, in all 1,130 ounces, amounting to $18,645, have been received at the First National Bank of Helena since November 19th. Yet this is the case, and this is a small part of their business in this line. Most of this was received from the Cœur d'Aiene country. Since November 5th they have received from the Boston & Montana, $38,990; from the Elkhorn, $12,800 in gold. Within the last month the Helena Mining & Reduction Company has shipped over 5,100 bars, or over 650,000 pounds of base bullion. The expenses of this company, including dividends paid, are over $100,000 per month. That the company is doing a splendid business is shown by the payment of two dividends in a little more than one month. It takes no great stretch of the imagination to understand that the receipts of the company are very large, and doing a handsome business.

The Merchants' National Bank received last evening from the Drum Lummon eight bars of bullion worth about $18,000. We are informed that shipments of this kind are made about twice a week from the Drum Lummon. It is easy to compute the enormous amount which would be received at this rate in the course of a year. This is from one mine alone. Large quantities are received from other smaller mines tributary to the city.

A NEW PROCESS OF REDUCTION.—Professor James Warren, of the electric light station, is the inventor of a new process of reducing ores, which is done by the aid of electricity. One day while examining a piece of gold bearing quartz he accidentally let it fall into one of the dynamos, which was in motion at the time. On looking for the piece of quartz the next day, he found it in the dynamo, and to his surprise the gold in the quart had been melted and had run to one side of the rock, forming a beautiful button. Professor Warren immediately instituted a series of experiments, and has succeeded in copper can be instantly smelted from concentrations by a powerful electric shock, which almost equals in its intensity a stroke of lightning. The experiments so far have [illegible] lead and antimony ores, but he hopes [illegible] cessful also with them. Several [illegible] to be successful offered to put Professor Warren's capitalists have practical operation, but [illegible] back till the patent [illegible] sor Warren is also [illegible] fully perfected. Professor new kind of [illegible] at work on the model of a tionize [illegible] dynamo, which promises to revolutionize the electric world.—*Los Angeles Herald.*

The Bullion Tax in Nevada.

It is generally conceded in mining circles that the coming Legislature will take some action in regard to the bullion tax, and thereby contribute to the welfare of what is emphatically the leading industry of our State. When this Act was passed, it was universally considered a just levy, but the reasoning brought to bear at that time, in favor of the bill, has been stripped of its logic by changes and the lapse of time. Then mining was in a vigorous state, and silver was pouring from the earth in a steady stream. Other industries were struggling, and the receipts from the bullion tax undoubtedly encouraged many other enterprises in the State by lessening taxation that otherwise would have been a heavy burden. The demonetization of silver and the bullion tax added to the discount has had a disastrous effect upon the mining interest—in fact, it is literally crushing the industry that made the State and filled the coffers of the world. Every branch of trade has been more or less effected by the decline in mining, while thousands of commercial enterprises that flourished during the "palmy" days have been wiped out of existence or planted elsewhere. Our mineral fields are not exhausted by any means, but will never be developed in the manner they should while weighed down by an unjust and now burdensome tax.

Every year millions of dollars are appropriated by the general Government, to be expended upon harbors and rivers: or, in other words, to remove obstacles that beset navigation. If benefits are derived from such expenditure, and such is assuredly the case, will not the same rule apply to any other channel of trade? If these appropriations were not made, if obstacles were not removed, how long would it be before shipping would be driven from the rivers and harbors of our country? To encourage prosperity, everything of whatsoever nature that acts as an interruption, must be removed. Nineteen per cent of the product of a mine, is a total loss to the producer. It certainly requires no very high degree of intellect to discover that such a sacrifice is damaging to the industry, a serious obstacle in the way of mining prosperity. To encourage and revive an industry that has been of such incalculable benefit to the State, is certainly a duty, and the repeal of the Bullion Tax Act, would be a decided step in the right direction. Money, like human beings, is migratory, and where it can be used to the best advantage, there it will surely go. Every act that has a tendency to invigorate trade in any locality, acts also in bringing capital to that particular point. Offer inducements to the miner, clear the way for his prosperity, and the door of possibility is opened to other industries that are invariable accompaniments of successful mining.—*Silver State.*

We believe the above argument is sound and wholesome. It would have been very unpopular, if, in fact, it could have been offered eight or ten years ago. Then mining was a big game, and could stand almost any tax. Then anything like a proposition to repeal or modify the bullion tax, was regarded as a scheme to release the bonanza kings from their share of taxation and to place on citizens of small means almost the entire load of the State and county governments. It is about time now, that something positive be done to help out our languishing mining industry. This industry has stood terrible tax punishment in its better days for the sake of other industries. The latter, principally that of stock-raising, which can afford to do so, must be required to stand squarely in the breach.—*Eureka Sentinel.*

THE LEAD MARKET.—From all appearances our lead miners should not lose heart. It seems to us that there must soon be a real advance in the price of lead. There is but a small stock on hand. We have not the figures, but we do not think that all Utah, Idaho and Montana are producing as much as the Eureka Con. and Richmond Companies in Eureka were producing four or five years ago. We believe the present depression is due to a bear movement in New York and London, which is simply a speculation on the fears of the people. We believe the efforts being made at Washington to abolish the present duty on lead will be neutralized. We have a competent representative there, who understands the question thoroughly. As soon as it is known through mining circles that all hopes of the removal of the present tariff are vain, the old price will rule again, for the consumption of lead is speedily increasing, and the amount on hand is small.

THE GALT LUMBER Company has sold over $20,000 worth of lumber to residents of Ione, with estimated orders for nearly $6,000 more. This company, in its various ramifications,

Columbite in the Black Hills of Dakota.

Columbite associated with cassiterite, albite and mica occurs in several of the coarsely crystalline granite dikes which traverse the mica schists and sandstones of Pennington county, Dakota. The most notable localities are at the Etta mining claim and at the Ingersoll, about ten miles east of Harney Peak. At the Ingersoll claim, particularly, a mass of unusual dimensions was found protruding from a matrix of albite and quartz. This mass consisted of nearly pure columbite, with here and there inclusions of thin sheets of quartz. It measured, approximately, 20 inches square by 24 in length, weighing by calculation, taking the specific gravity at 6, not less than 2,000 pounds, or one ton. On blasting it out it broke up generally into tabular fragments without crystalline planes, except at the lower or imbedded end where it was enclosed in quartz, into which it penetrated in thin, tabular crystals with brilliant prismatic and terminal planes. At the Etta, on the contrary, the best crystals are taken from the albite, and are more distinct and separate than at the Ingersoll claim.

In breaking up the large mass I found several cavities filled with a beautiful yellow powder, often in pellets and pill-like balls. These prove to be chiefly hydrous uranium oxide, without sulphuric or carbonic acid. A similar mineral occurs at the Etta, but gives different reactions.

The blow-pipe reactions of the columbite from the Ingersoll claim are peculiar in the amount of manganese indicated. With borax, in O. F. the bead is dark amethystine red, and in R. F. a pale amber yellow. The purity of this reaction for manganese is not impaired by any other metallic reaction. With phosphate of soda and ammonia in O. F., the mineral dissolves to a clear glass, red while hot, yellowish-red while cooling, and when cold clear and nearly colorless, with a pale rose colored or amethystine tint. In R. F. the bead is beautiful amber-yellow, and there is no shade of green or reaction for uranium. On foil the manganese reaction is distinct. Treated with concentrated sulphuric acid, and evaporated to dryness, the powdered mineral is partially decomposed. With the addition of a second portion of acid, the solution gives with zinc the intense sapphire-blue reaction.—*Wm. P. Blake in Amer. Jour. of Science.*

Old Dominion Copper Co.

Through the courtesy of Superintendent Trippel, a representative of the *Belt* was permitted on Wednesday of last week to view and examine the works of the Old Dominion Copper Company. The equipment of the mine and plant until recently was very crude, and inadequate to the requirements, but the work, which was in an unfinished state when the present management assumed charge of the property, has been energetically pushed to completion, and other much needed improvements are being made, all of which will greatly facilitate and cheapen the handling of the ore. Probably the most important item in this connection is the straightening and enlarging of the main tunnel, over 1,000 feet in length, and the laying of a track through it, which has just been finished. Near the mouth of the tunnel a substantial ore bin, with a capacity of 200 tons, has been erected. This bin is to be connected with the dump by a trestle, work on which will be begun immediately. It is expected that this will be completed by January 1st, and all the ore from the Old Globe mine, which is now raised from the main air shaft, will then be delivered into the new bins through the tunnel. This change will make a considerable saving of labor and expense in handling the ore.

At the entrance to the tunnel a blacksmith shop has been built, and a large house for the carpenter is also being put up. Other improvements, lately made, were noticed: A hood, which was greatly needed, has been placed over the main air shaft, and the engine and boiler, connected with the new hoisting works, have likewise been enclosed by a frame structure. Another desirable work now progressing, is the construction of a road, several hundred yards in length, to connect the Alice claim with the main avenue of the company, and the intervening arroyo will be spanned by a durable trestle. On the Alice claim, controlled by the Old Dominion Company, a new shaft is being sunk with a view of better developing that property. At the smelter we observed that a new coke bin was being built and other lesser improvements made. In the mine an immense amount of timbering and development work has been done. It is now proposed to sink a shaft 400 feet ahead of the extremity of the present works, in order to better open the mine. Nothing practical, tending to economic management, is being overlooked.—*Arizona Silver Belt.*

SHASTA COUNTY timber resources seem almost inexhaustible. There is a vast acreage of most magnificent pine, cedar and fir timber in almost all parts of the Sierra Nevada Mountains from the extreme south of the county to the farthest point north. A number of saw-mills are in active operation, and a great enterprise has been inaugurated to float timber down the Pitt and Sacramento Rivers, to be manufactured into lumber near Redding. Large bodies of splendid oak trees are found all through the mountain region, and in many places there is a

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHIP'S STEERING APPARATUS.—Chas. F. Rodeen, S. F., assignor of one-half to Chas. Nelson. No. 308,804. Dated Dec. 2, 1884. This invention relates to that class of ship steering gear in which an endless chain is employed to transmit power from the wheel to the tiller, and the invention consists in a reciprocating traveler connected with the tiller, and in a novel arrangement of blocks and shieves, used in the course of the endless chain. The object is to provide a means by which sufficient purchase can be brought to bear readily to operate the tiller and hold the rudder in any given position to prevent its "kicking."

STEAM BOILER.—Wm. Kincaid, Oakland. No. 308,677. Dated Dec. 2, 1884. This consists of a series of short tubes, closed at one end and opened at the other. These tubes are used in connection with the double walls or water legs of boilers, the open ends opening through the inner wall into the furnace or fire box, while the rear or closed ends have bolts extending outward from them, and through the outer wall, so as to form stays for holding the walls in place, as well as providing an extra heating surface.

WAX EXTRACTOR.—Joseph D. Enas, Napa. No. 308,958. This is a wax extractor of that class in which the combs are confined within a foraminous vessel encircled by a suitable steam jacket, and having a central passage by which steam is admitted to the center of the mass of combs; and the invention consists of an underlying body of water into which the melted material drips, and from the surface of which the wax is allowed to overflow while the sediment is drained off from below. It consists further in the peculiar arrangement and construction of vessels and detail. The object is to provide a simple, effective and easily-operated device for extracting the wax from honeycombs.

CENTRIFUGAL HONEY EXTRACTOR.—Oliver P. Squier, Santa Barbara. No. 309,003. Dated December 9th, 1884. This invention relates to that class of centrifugal honey extractors in which the pockets or frames containing the combs are arranged in the circumference of the rotating basket, whereby the honey is thrown from the side of the pockets into the vessel or case in which the rotating basket is mounted; and the invention consists in a peculiar connection between the several pockets, whereby, through the movement of the one, all of said pockets are simultaneously reversed, in order to present their opposite sides outwardly, that honey from both sides may be extracted in the course of the operation. The object of the invention is to so connect all the pockets that all of them may be reversed easily and at the same time, thus obviating the necessity of removing them from the basket in which they are mounted, or of employing time in turning or reversing each pocket separately. The means shown for accomplishing the result seem simple and effective.

COLORADO'S PROBABLE OUTPUT.—There is some little uncertainty as to what the ore product of Colorado, New Mexico and Arizona will amount to this year, as well as to how the output of each section will compare with that for 1883. Arizona and New Mexico have had much to contend with—the shutting down of the Tombstone mines in the one Territory and the business failures and consequent stoppage of work in the other—but the sections are new and the record comparatively small, so that it is more than probable that the output from the new mines and new districts will more than make up the deficit and probably give a considerable increase in New Mexico and some gain for Arizona. About Colorado there is considerable difference of opinion, but from data at hand we figure as follows: There will be a considerable falling off from Leadville; Clear Creek county will lose about $100,000; while Summit, Gunnison, Fremont and perhaps one or two counties, will show losses; Chaffee, Pitkin, San Juan, Ouray, San Miguel, Dolores and Lake will make radical gains, while one or two other counties will gain something. The question is, will San Juan, Ouray and San Miguel counties make up for the loss to Leadville? We fear not, because we believe that loss will amount to several millions; and an increase of two or three millions in these counties is all and more than can be hoped for. From this we argue that the product of Colorado will be several millions less for 1884 than for the previous year. There is just a possibility that the falling off in Leadville will not be so great as is now feared, and upon this only we hang the hope of Colorado holding her own.—*Rocky Mountain Mining Review.*

H. C. FARNHAM has got his new saw-mill, which is in El Dorado county, in good running order, and is turning out some splendid lumber. He has a lumber yard in Oleta, Ione and Plymouth, all of which seem to be doing a good business.

THE LARGE SASH and door factory of Florin Bro., at Fall River mills, Shasta Co., is now in

ENGINEERING NOTES.

The Manchester Ship Canal.

The great scheme of the Manchester Ship Canal, says the London *Daily News*, is to be brought before Parliament in the coming session. In a former year it passed the Select Committee of the Lords, to be lost in the same stage in the Commons; last session it got through the Commons Committee, to be rejected by that of the Lords. The main contention of its opponents was that the scheme in the form in which it was then proposed would be seriously injurious to the channel of the Mersey. The committee in the Lords were not fully satisfied that this objection had been shown to be groundless. The scheme has now been remodeled, and may be briefly described as one for the formation of a ship canal, navigable by the largest vessels, from Manchester through Warrington to the estuary of the Mersey near Eastham. The distance is some 30 miles, and, though for a large part of the way the country is favorable, considerable engineering difficulties have to be surmounted. It is one of the busy districts of England. It is traversed by various great canals, by many large lines of railway, and by two tidal rivers. To take through such a district a vast waterway along which great steamers and ships with lofty masts can make their passage in safety is one of the most difficult undertakings suggested in modern times. The scheme, however, is well thought out, and provision is made for all the inevitable interferences it must make with other enterprises. The proposal may almost be said to involve a reconstruction of the transport arrangements of the valleys of the Irwell and the Mersey: By the completion of this great work Manchester and its great ring of towns will be practically put upon the sea. Ships would load and unload on its own quays, and the beginning of the voyage of its exported goods and the ending of the voyage of the raw material would be at the doors of the manufacturers instead of 30 miles away. It is clear enough that if this can be brought about without imposing too heavy a tax on the trade there might follow a considerable expansion of the business of which Manchester is the center. Liverpool would probably meet the competition by new facilities and reduced charges, and both ways the cotton trade and other great industries would be vastly benefited. It is thought that Parliament will now no longer refuse to pass the enabling act.

THE TREATY WITH NICARAGUA.—One of the most important announcements made in the President's message was that the Government has concluded a treaty with the republic of Nicaragua for the construction, by the United States, of a canal, railway and telegraph line across the Isthmus.

The route over which it is proposed the Government shall build a canal lies between Greytown on the Atlantic and Port San Juan del Sur on the Pacific. Surveys have been made of this route several times, and it is highly commended. The proposed line of canal will pass directly through Lake Nicaragua, which is 90 miles long and 40 miles wide. Its waters are fresh and of sufficient depth to float vessels of the deepest draught. There are also several islands in the lake which can be utilized for repair and supply stations. The lake is 110 feet above tide water, and six locks and five intermediate levels will be required for the Pacific side of the canal. On the Atlantic side five locks and four intermediate levels are proposed. These locks, an authority says, would no more limit the number of vessels passing through the canal than would a single tide-lock on the Pacific end which is necessary to any route, even by a level sea way. The canal would have to be dug 17½ miles to unite the waters of the Pacific with the lake. Upon the opposite side 36 miles will have to be excavated, making a total of 53½ miles and 119 by canal, river and lake. The distance between San Francisco and New York will be shortened 10 days. The estimated cost is from 43 to 75 millions.

"OCEAN GREYHOUNDS."—The steamships plying between England and New Zealand are among the "ocean greyhounds." They have done the enormous distance of late in little over 37 days. Writing of this, a correspondent of the London *News* ecstasizes as follows: "Talk of the age of miracles! Here is an exploit far transcending any conceivable mediæval myth; and if all its bearings are duly considered, I venture to say far transcending also in importance to the English people any political change that could possibly be effected by Parliament. Here is a second England brought 5,000 miles nearer than it ever was before. With an area equal to that of the older one, and a climate infinitely superior, she yet has but 500,000 of population to the 40,000,000 of the mother country.

THE SUEZ CANAL TO BE WIDENED.—In regard to what shall be done to accommodate the rapidly increasing commerce crowding upon the Suez Canal, Count de Lesseps and the commission have completed their examination of the canal at Ismailia, and approved the plans for widening the waterway.

USEFUL INFORMATION.

The Cochineal Insect.

The appearance, habits and mode of collecting this singular and very useful insect is given as follows: "One of the best and most powerful animal dyes used in the arts and manufactures is the body of the female cochineal insect, dried. This insect exists on a species of cactus, and when alive is about the size of a lady-bug, or perhaps a trifle smaller. It is wingless, rather long, equally broad all over, and is marked behind with deep incisions and wrinkles. It has six feet, which, curiously enough, are only of use directly after birth, and it secures itself to the plant by means of a trunk, which is found between the forefeet, and derives its nourishment from the sap. The male cochineal is like the female only during the larva period. It changes to chrysalis, and eventually appears as red flies. The female deposits some thousands of eggs, which she protects under her body until they are hatched, and on the appearance of the young ones the parent dies. While the young are in the larva state, their sex cannot be determined. They lose their skins several times, and while the female fixes herself on the plant, the male, after getting over the pupa state, is winged. Two or three months is the extent of the life of these little insects. They are gathered before they lay eggs, and are then rich in coloring matter.

"Carmine is prepared from the cochineal insect, the *Coccus acti*, which is collected by brushing the branches of the cactus with the tail of a squirrel or other animal. This is very tedious work. They are killed by immersing them in boiling water, and this has to be done or they would lay their eggs, and thereby lose much of their value. There are many processes for preparing the carmine. The French process may be taken as an example. One pound of powdered cochineal insects is boiled for fifteen minutes in three gallons of water; one ounce of cream tartar is then added, and the boiling is continued ten minutes longer; then one ounce and a half of powdered alum is thrown in, and the boiling continued for two minutes longer. The liquid is then poured off and set aside for the carmine to settle down. In other processes carbonate of soda for potash is used."

HOW TO TAN SHEEPSKINS.—Where farmers kill but a few sheep during the season they can make better use of the pelts than to sell them if they know how to preserve them. For mats, take two long-wooled skins, and make a strong suds, using hot water; when it is cold, wash the skins in it, carefully squeezing them between the hands to get the dirt out of the wool; then wash the soap out with clear cold water. Then dissolve alum and salt, each a half pound, with a little hot water, sufficient to cover the skins, and then let them soak in it over night for twelve hours; then hang over a pail to drain. When they are well drained, spread or stretch carefully over a board to dry. When a little damp, have one ounce each of saltpeter and alum, pulverized, and sprinkle on the flesh side of each skin, rubbing in well; then lay the flesh sides together, and hang in the shade for two or three days, turning the under skin uppermost every day until perfectly dry; then scrape the skin side with a blunt knife, to remove any remaining scraps of flesh. Trim off projecting points; rub the flesh side with the hands. They will be very white and handsome, suitable for a door or carriage mat. They also make good mittens. Lambskins, or even sheepskins, if the wool be trimmed off evenly to a half or three-fourths inch long, make beautiful and warm mittens for ladies or gentlemen, and the girls, with a little practice, can make them.

SHEEPSKIN LEATHER.—The uses for which leather made from sheepskins is employed are almost numberless. Sheep are raised in large numbers over so great a portion of the earth's surface that the supply of raw skins is immense, and, tanned with either bark or sumac, or tanned with alum, it can, although possessing much less strength than the goat skin, be finished to imitate almost any description of light leather. It fills a large place for linings and facings of boots and shoes; its use for bookbinding far exceeds that of all other kinds of leather together; it is almost the only kind of leather employed for hat linings, and for pocket-books, ladies' belts, satchels, toilet cases, furniture coverings, and the thousands of lesser articles in which leather is used, sheepskin is more employed than any other kind, particularly in articles to be sold at a low price.

SIMPLE TEST FOR GLUCOSE IN SUGAR.—The simplest and best test is to place a little of it under the low power of a microscope. Magnifying forty times is quite sufficient, and less will do. Cane sugar under this power is distinctly and beautifully crystalline, and each crystal looks like rock candy. They are clear, bright and beautiful. Glucose, on the other hand, has a dull, opaque appearance, like a lump of tallow. Once seen, it will be easily known ever after.

SEPARATION OF WOOL FROM COTTON.—Aeddehault has devised a new method for the separation of cotton from wool when the two fibers are mixed, as in rags, etc. The rags are simply subjected to the action of a jet of superheated steam. Under a pressure of five atmospheres the wool melts and sinks to the bottom of the receptacle, while cotton, linen and other vegetable fibers stand, thus remaining suitable for the paper manufacture. The liquid mud which contains the wool thus precipitated is then desiccated. The residue, which has received the name of azotine, is completely soluble in water, and is valuable on account of its nitrogen. Moreover, its preparation costs nothing, because the increased value of the pulp, free from wool, is sufficient to cover the cost of the process.

WASHABLE COATING FOR GYPSUM FIGURES.—According to C. Puscher, 3 parts of caustic potash are dissolved in 36 parts hot water, 9 parts of stearic acid are added, and the obtained soap paste is diluted with the same quantity water and 95 per cent alcohol. The warm solution is applied upon the warm gypsum cast, and this, after a few hours, is repeated with wet sponge. The casting becomes still handsomer if, in place of potash, a corresponding quantity of ammoniac is used. Old casts are first cleaned with a 3 per cent caustic potash solution.

TO POLISH FINE CARVED WORK.—To polish fine carved work, take a half pint linseed oil, half pint of ale, the white of an egg, one ounce French spirits, one ounce of spirits of ammonia; shake well before using. A little is to be applied to the face of a soft linen pad, and lightly rubbed for a minute or two over the article to be restored, which must afterward be polished off with an old silk handkerchief. This polish will keep any length of time, if well corked. It is useful for cabinet work, and is also recommended for papier-maché work.

COLORLESS CEMENT.—The following receipe is said to produce a perfectly colorless cement. In an air-tight bottle 75 grammes of india rubber cut into little pieces are mixed with 60 grammes of chloroform. After complete solution of india rubber, 15 grammes of mastic are added, and the mixture warmed eight days till the latter dissolves also.

UTILIZING HORSE MEAT IN LONDON.—Three thousand horses die each week in London. Their carcasses are purchased by a company which delivers meat for cats and dogs to many thousands of customers. There are 700,000 cats in the city.

GOOD HEALTH.

The Adult Blind.

California makes no provision for her adult blind. They are not very numerous, but on account of accidents around mines and machinery, of mishaps by flood and field, there are a greater percentage of the total blind than in an Eastern population. They are usually of the class of laborers and mechanics, men whose sight is accidentally eclipsed at a time of life when they have no great accumulation of property, but are industrious and capable of self-support even in their blindness, if the State, which reforms criminals and cures the insane and homes the crippled, will give them a chance to learn the blind trades. We have a blind asylum which is under excellent and enlightened management, but the law excludes the adult blind, therefrom, and the mangement is obliged to obey the law.

The Legislature makes the law. For that purpose the Legislature is the State of California, and does this great State, whose name is in literature a synonym for wealth, used like Golconda and Ind, as a term convertible with gold and glitter, propose longer to disgrace herself by forcing her adult blind to beg on the streets for the poor crusts and cup of water to keep them alive while they implore her to give them a chance to acquire the simple mechanical knowledge of the blind trades which will make them independent and self-supporting?

If this Legislature adjourn without doing something in this behalf, its members should be marked for future use when we seek a work that implies coldness of heart and the cruelty of uncharity. We solicit the ever ready pulpit to remember the Master and Bartimeus blind, and add its voice and influence to the press to call the attention of our law-makers to this prime need of the State. We know the Legislature will be kind to these unfortunates and we believe it will refuse to adjourn until it has made the amplest provision for their reception into comfortable public quarters equipped with machinery and supplied with instructors who will teach its use and make them self-supporting. We have said that this is our business with the Legislature. Reader, it is also yours; it is, in fine, the business of every charitable man and woman in California. Let us pull all together and accomplish it.—*Oakland Times.*

The Hydrochlorate of Cocaine.

The *Druggist* regards the anæsthetic properties of hydrochlorate of cocaine as one of the most remarkable discoveries of recent times.

It has so far been employed with uniform and marked success as a local anæsthetic to the eye, nose, mouth, uretha, and other mucous surfaces. Painless operations have been performed on these parts, while the patient suffers none of the discomforts attending the use of general anæsthetics, as chloroform or ether. A solution of one grain of the hydrochlorate of cocaine, in about 30 minims of water, is sufficiently strong for use in operations on the eye. A few drops will gradually render the parts insensible. It may be applied either by dropping, or with a camel's hair pencil. The anæsthetic effect on the cornea begins after a few minutes, and is usually completed in about 10 to 20 minutes, and begins to decrease after half an hour. Dr. H. Knapp, the professor of opthalmology of the medical department of University of New York, made numerous experiments, several of them upon himself and other members of his family.

Cocaine is a mydriatic, but is not poisonous, like the other alkaloid mydriatics. We believe this to be the first instance of a non-poisonous local anæsthetic drug on record. The cocaine is obtained from cocoa leaves, which yield about one-fourth of one per cent, or less, according to quality. It will next be interesting to learn what relation the now well-established local anæsthetic effect of this alkaloid bears to the already known and extensive uses of cocoa and its fluid extract. As cocoa and cocaine have been observed to exhibit the same or very similar properties as are obtained from coffee, guarana and tea, and their respective alkaloids, it is not impossible that one or more of the latter may also be found to have local anæsthetic effects.

The Use of Chloral and Bromide of Potassium.

The following, from the *London Lancet*, has more especial reference to the use of the above remedies by persons in comparative health,—to its use by such as opium is frequently used. But it is well, also, that the character of these remedies should be known by all. The *Lancet* says:—Again we have to record, with deep regret, a sad proof that those who give or take chloral or bromide of potassium for sleeplessness are guilty of a deplorable error and do a grievous wrong. The narcotics which poison sleep also deprave the higher nerve centers, enfeeble the controlling powers of the will and leave the mind a prey to the depressing influence of a conscious loss of self-respect and self-confidence. The cultured mind feels the ignominy of the intellectual and moral depreciation with great acuteness, and in the end succumbs to the sense of powerlessness to recover self-control and do right. The deprivation wrought is purely physical. The baneful influence of the lethal drug is, so to say, organic. The essential elements of the nerve tissues are blighted by the stupifying poison, as by alcohol in habitual drunkenness. In short, the recourse to chloral and bromide is precisely the same thing as recourse to alcohol. The man or woman sent to "sleep"—the mocking semblance of physiological rest—by a dose of either of these narcotizers is simply intoxicated. No wonder that habitual drunkenness of this class first impairs and then destroys the vitality of the mind organ, and places the subject of a miserable artifice at the mercy of his emotional nature, and makes him the creature of his passions. When will the public awake to the recognition of facts with regard to these most pernicious of stupefacients? Persistence in recourse to them has no better excuse than unwillingness to search out the cause of the wakefulness which prevents natural sleep.

WATER REQUIRED.—The amount of water required for the human system is from four to five pounds per day. Part of this is, of course, supplied by our food, but not all. Those who eat much salty or highly-spiced food require the most. The man who consumes much fruit requires much less drink. It is an excellent plan, when possible, to take our liquids as much as possible in the form of fruits as, in spite of all our precaution, most water, unless distilled, is more or less loaded with impurities of some sort, and often of a dangerous character.

FOOD FOR THE OLD.—An old person neither has the appetite, the power of digestion, nor the demand for food that younger persons have, and it is a dangerous plan to feed him too largely or luxuriously. His body is less active, his lungs take in less oxygen, his blood flows more slowly, his mind acts less vigorously, and to this lower change of vital activity, his food must be accommodated.

CREAM FOR INFANTS.—Struve upholds Dr. Biedent's suggestion that only cream should be used for the earliest nourishment of young children brought up by hand, as the digestibility of any milk is inversely as the quantity of caseine which remains in the skim milk.

A GOOD GARGLE.—A gargle made of strong black tea, and used cold, night and morning, is now the fashionable preventive in London against falling a victim to sore throat during the cold winds of spring, and similar "cold spells" at other times of the year.

TO GIVE CASTOR OIL.—The French method of administering castor oil to children is to pour the oil into a pan over a moderate fire, break an egg into it, and stir up; when it is done, flavor with a little salt or sugar, or currant jelly.

TO REMOVE WARTS.—Dr. Et Guenot reports that he has removed a large crop of warts occurring on the hands of a patient by giving daily a ten-grain dose of calcined magnesia in the morning before breakfast.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

COMMENCED OPERATIONS.—Amador *Ledger*, Dec. 27: Hadley and Cassinelli, of Volcano, have commenced operations on the old Siebenthaler quartz mine, situated about five miles north of Volcano. They have purchased the Golden Gate hoisting works, and have already moved the machinery to the mine. Six to eight men are employed, and it is reported that good rock has been struck in sinking. At the Marlette quartz claim, at Middle Bar, some very rich metal has been taken out within the last few weeks. The claim is worked by means of a tunnel, which is 40 ft from the surface. In this tunnel a shaft has been sunk about 60 ft. The water in the shaft is troublesome, and has compelled a suspension of work for the present. At the McKinney and Cranis quartz claim, also located at Middle Bar, two men are employed. A shaft has been sunk 100 ft, and a drift run west 15 ft, with indications of soon striking pay ore. Messrs. Reed and Sidney Smith are working away at the St. Louis mine, near Irish town. They can take out and crush on an average about three-quarters of a ton per day. The crushing is done by an arastra. At this rate it pays fair wages, the ore yielding from $10 to $12 per ton. The big tunnel at Middle Bar is now in a distance of 1700 ft. The header is in slate and quartz. It is believed that the tunnel has struck the line of the main ledge at a barren spot between two ore chimneys. The Mammoth mill was to be started up to-day, Friday. The latest excitement in quartz is a strike in the yard of Mrs. Judge Moore, just behind the house. Some of the quartz shows free gold. The ledge was found close to the surface. A man, we understand, will be put to work to-day. It is a very likely place to strike a pocket, being on a line with the Hinckley mine, which has yielded richly in pockets.

THE ST. JULIEN.—Amador *Sentinel*, Dec. 26: We learn that work on the celebrated St. Julien mine, which has been in *statu quo* for some time past, has been resumed, and we confidently expect soon to be able to record further instances of its wonderfully rich productions.

PLYMOUTH.—Cor. Amador *Dispatch*, Dec. 27: Mining is still being pursued by anxious speculators in this vicinity, and all along that portion of the mother lode that is as yet untouched, comprising a distance of six miles south of the Pacific and ten miles north of the Empire. This mentioned space might be properly called an undeveloped field of gold, and capitalists who seek investment for their money can surely find no better place in the wide world than along this portion of the mother lode that is as yet unknown, so to speak, and still has a wide reputation. I predict that another 20 years will not only see that portion of this ledge north of Plymouth a continued string of quartz mines, but that it is now a true foundation for a city of 50,000. This may seem like a wild conclusion, but if the reader lives in this county these 20 years he will surely see these statements verified. Already this ledge is being tapped in a few places on this line. At Enterprise a shaft has been sunk to the depth of 400 ft. They are now drifting for the ledge, which they expect to reach by spring. Still this side (south) of Enterprise is the old McGuire mine, which is now being emptied of its water preparatory to being put in operation. This mine is known to be first class.

Calaveras.

CLEAN-UP.—*Mountain Echo*, Dec. 27: A clean-up was made at the Matson mine the other day, which consisted of a five days run. The ore paid a fraction over $4 per ton. This, of course is not a rich yield, but when we consider that the lead is more than 50 ft wide and can be extracted for less than 50 cents a ton, it becomes a big thing.

PUMP.—Bechtel, the owner of the Stickle mine, is using one of the New Era Duplex Steam pumps. It was started the other day, and is one of the most remarkable pumps ever brought to this section. The valve motion is the prominent and important peculiarity of this pump. At a stated number of strokes, say 100 per minute, this pump will throw 185 gallons of water, making 11,100 gallons per hour.

THE STORM.—Calaveras *Chronicle*, Dec. 27: Dams have been carried away, mines filled with water, mining property damaged, and roads washed out and otherwise made impassable, and travel interrupted. There is not a claim in Chili gulch or on Tunnel ridge but what has suffered damages, by caves, filling in with water, breaking dams, etc., causing losses and temporary suspension of operations.

MURPHYS.—Cor. Calaveras *Citizen*, Dec. 27: The activity now noticeable in our neighboring district of Angels, and the wave of prosperity that overspread it, is sure to extend here sooner or later, when a showing will be made that will compare favorably to any district in the State. Among the mining industries now in successful operation in our midst is the "Oro Plata Mill and Mining Co." There are seven mines belonging to this Co. Six of these mines carry ore similar in character, containing gold, silver, and other minerals, and the ore is high-grade and rebellious. A large excavation was made some 80 ft deep on the "Red Wing," near the Oro Plata line in apparently an unlimited body of free-milling ore—low grade. To test the practicability of reducing this ore at profit, a 15-stamp mill was erected this summer. This mill has now been in operation some two months. A screen is used admitting the reduction of 85 tons of ore per 24 hours, and during these two months 2,000 tons of ore has been reduced. The company based their calculations of extracting and reducing this ore at a profit approximating $2 per ton, and as the result of the past two months crushing has proven that the average run is over that figure, it may be set down that they have demonstrated beyond the possibility of a doubt that ore can be worked at this mill at a profit at less than $3 per ton. The company have run 400 ft of tunnels, drifts, etc., most of which were in solid rock the past year. The adjoining district north of Murphys, on Indian creek, is Washington, and is remarkable for its high-grade ore, good-sized veins, and excellence of formation. It contains some of the oldest, and most marked mines in this section. Perhaps the best known among these are those belonging to the Calaveras Gold Mining Company—the Oro Minto and the Enchantress. The Oro Minto has two shafts, one 325 ft deep and one 400 ft deep. On the latter is the hoisting works driven by a 100-horse-power engine.

Mariposa.

HORNITOS.—Cor. Mariposa *Gazette*: Before long we shall see men with picks and shovels and pans scratching the bottom of every gulch in search of gold. Want of water is a great drawback for placer mining in this county. Hundreds of places known to contain gold, cannot be worked in dry weather. In the winter season, we take advantage of rain and dam up the surplus water and work, but in the dry season we have to turn our attention to other things. Mining suffers thereby, and if we had water enough many a poor devil would have gold in plenty. Work has been suspended at Quartz Mountain, and will be until the rain ceases. The machinery is nearly all on the ground and it is the intention of the owner to put up a 10-stamp mill to thoroughly prospect the mine before engaging in bigger work. The large 10-ton boiler of the Washington was taken to Quartz Mountain and masons are waiting for a few days of dry weather to put up the brick-work. The owners of the Three Oaks and Honeycomb mines, Mrs. E. Merck, is having some 35 or 40 tons of quartz got together and ready to haul for crushing at Barcroft's mill. It is thought that this quartz will pay from $30 to $35 per ton, and some mining experts think the expectations will fall short of realization.

Nevada.

RAINS. — Grass Valley *Union*, Dec. 26: The heavy rains of the past week have placed an embargo on quartz prospecting. On account of the storm and soft condition of the roads quartz teamsters have been idle for the past week. The water in the North Star mine was lowered 90 ft last week. The 500 level will be clear of water next week. A force of tributers will soon be put to work in the upper levels of the mine. The machinery on the Horseshoe was found inadequate to contend with the great inflow of surface water caused by the recent heavy rains, and operations have been suspended for the remainder of the winter. When work is resumed in the spring a water-wheel of much larger capacity to furnish power for pumping will be put up. The crushing of rock from the mine, made just before the commencement of the storm gave a profitable yield, and the mine was showing well for future operations. The third installment of 25 per cent on the $40,000 subscription to the working capital of the North Star Mining Company has been called for, payable January 10th.

WILL NOT PAY TO DRIFT.—North San Juan *Times*, Dec. 27: Our special correspondent at Bloomfield writes us that on Tuesday of last week the Malakoff Company discharged 24 of their employes and that in the near future all the men employed except 2 will be discharged, as the company has concluded that the mine will not pay to work it by the drifting process. The Delhi quartz mine near Columbia Hill is developing some very rich rock, and gives promise of becoming a mine equal, if not superior, to the celebrated Idaho mine at Grass Valley. A ton of rock taken from the 100 ft level yielded $97. An assay of rock taken from a lower level yielded at the rate of $400 to the ton. The owners of the ledge have a large number of men at work taking out rock, and they are constructing at the ledge a 10-stamp mill with improved machinery. They have a crushing machine on the ground now which performs good work.

Plumas.

THE ANO MINE.—Greenville *Bulletin*, Dec. 27: Mr. Standart informs us that the Arcadian mill, which has been run 16 days previous to the heavy storm, has stopped until the weather and the condition of the roads will permit the hauling of ore from the Ano. As a result of the 16 days' run, over 300 ounces of amalgam was obtained. Considering the small force employed in the mine, this is a most satisfactory showing, and it speaks well for the property. The Ano mine is owned by Standart and Davis. There are numerous mines in the district, which, if, in the hands of an experienced, economical and business superintendent, as Mr. Standart has shown himself to be, would pay well.

LIGHT'S CANYON.—Plumas *National*, Dec. 27: Mr. A. J. Ford informs us that the Engle Bros. are still at work on their copper ledge in Light's canyon, and have developed a large ledge that prospects well. Their mine is very extensive, and sure to prove valuable when thoroughly opened. The boys are pure grit, and deserve to become millionaires.

San Bernardino.

MINING PURCHASES.—Calico *Print*, Dec. 27: Recently R. B. Johnson purchased interests in mining property as follows: He bought the Mountain Chief mine, situated a half mile east of Calico, and extending to Deep canyon. It is bounded by the following mines: On the west by the Nellie, east by the Big Chief, south by the Bull's Eye, and north by the McCullough. The Mountain Chief is favorably situated and prospecting on the same has been attended with favorable results. No work has been done on the mine other than assessment work and prospecting. He bought a one-half interest in the Spar ledge, which takes its name from the character of the rock in the ledge. This mine is situated 600 ft southwest of the King mine, and is of the same formation as the latter. It runs parallel with Red Cloud which joins it on the east, and is bounded on the west by the Hillside and Moran mines. The assessment work has been done on this mine and the work of prospecting showed up so well that Mr. Johnson was induced to purchase a half interest. H. B. Stevens owns the other half interest in the mine. Mr. Johnson bought entire the Canyon mine, about three-quarters of a mile in an easterly direction from Calico, and is bounded on the east by the Big Chief, and on the west by the Bull's Eye. The assessment work has been done on this mine and while being prospected some ore was taken out that assayed $125 to the ton.

SANTA MARIA.—Work is progressing on the Santa Maria mine, which is parallel with the Blackfoot, and the showing is good, some rich ore having been taken out recently. This mine is joined on the south by the Golconda, on the east end by the Sam Houston No. 3 and on the west end by the Alhambra. The owners of the Santa Maria are R. B. Jonnson, of Los Angeles, and Frank Locan, of San Francisco, the former owning a one-third and the latter a two-thirds interest. This mine is quite favorably located in the midst of fine properties and we may reasonably expect developments that will lift it into importance as a bullion producer.

KRAMER.—J. L. Coffman came to town last Monday and brought with him some samples of ore from his mine at Kramer, which were assayed by G. E. Thede, resulting in $93 gold and 13 ounces silver to the ton. This ore was taken at a depth of four ft from a four-ft ledge consisting of a solid mass of quartz rock.

Shasta.

SOLD.—Shasta *Courier*, Dec. 27: The purchase of the Shafter mine, at the Tower House, by W. T. Coleman, marks a new era in the history of that valuable property. The price paid for the property was $16,000. Shafter has already taken out a fortune and the mine is not yet fairly opened. The ore is free milling and easily worked.

Sierra.

QUARTZ AT POKER FLAT.—Sierra *Tribune*, Dec. 26: About one-quarter mile north-east of Poker Flat, P. R. Gardnier, with his son and four others, are operating on a quartz ledge that bears every indication of proving a permanent and paying piece of mining property. The parties struck the first prospect in the vein last Thanksgiving day. Since that time they have run 12 ft through the pay-chute and taken out about 50 tons of ore, which is now on the dump. The ledge varies from three to four ft in thickness. They have also run a tunnel 80 ft lower down the hill and encountered the vein at a distance of 50 ft from the surface. Gold can be obtained in the ledge at the latter point. Mr. Gardnier arrived in town Tuesday, and called at this office. He left a piece of rock with us that was picked up on the dump. If he had given us a ton of the same sort we would be worth $20,000 more than we are at present. That gentleman's chief business here was to secure one of those patent quartz crushers manufactured at the Downieville foundry. The mill was purchased, but the storm prevented its being shipped. It is not probable that the crusher can be packed into the mine now this winter, as we understand that about eighteen inches of snow had fallen on the mountain up to Wednesday. It is to be regretted that the mill could not have been got in there this season as the parties would then have realized some profits while pushing ahead developments in their mine. However, our friends have no reason to feel discouraged, even at such a drawback, and the gold will be worth just as much another season, at all events.

SIERRA CITY.—Truckee *Republican*, Dec. 20: On Monday evening Mr. A. W. Bishop and Herbert Winter, the latter recently from the East, passed through Truckee from Sierra City on their way to Oakland, where the former, Mr. Bishop, resides. From him we learned that the celebrated Marguerite mine, two miles below Sierra City, will have its mammoth machinery all in readiness and start up next Saturday, when we may expect to hear some good news from that truly excellent mine. It is located about seven miles north or northerly from Sierra City, between Butcher ranch and Hog canyon, and about five miles south or southerly, and on the same range with that truly famous Four Hills mine in Sierra county.

SIERRA CITY.—*Mountain Messenger*, Dec. 27: The Colombo contractors are running the lower level as fast as powder and muscle will permit, for the lode which had been displaced in the front by some fault. At the Marguerite mine, Supt. Myer has been hard at work day and night almost, with a gang of men, to keep the tailings that came down the river, out of the mill flume, and we are sorry to say, that when the freshet was at its height, the water tore away five or six boxes, but with Mr. Meyer's great energy, the damage was repaired the next day, and the mill running again. Mr. Chas. Hendel was surveying during the storm, in that mine, to connect the 4th with the 3d level, through their new three compartment shaft, and the workmen are now busy raising up on the lode. Mr. P. A. Humbert, the Consulting Engineer, who designed and patented the hoisting and pumping apparatus by wire rope, has completed everything, and a few days ago the machinery was set in motion by his brother, Arthur, everything working to their entire satisfaction after a few trials. By this way of working their mine, the Company will save from 8 to 9 cords of wood per day. They expect in a few days to have their hoisting machinery on said new shaft, all completed. The sinking pump now placed on the third level, is a double-acting plunger, invented by Mr. Humbert, and will be doing its duty until the new shaft is completed to the 4th level, where the 11,000-lb. station pump will be placed, and from where the station pump will be advanced as the shaft progresses in depth. It is expected that with this new machinery, that the mine can be worked to at least 1,500 to 2,000 feet. The Company's mill of 20 stamps, is steadily crushing the rich rock from the mine, yielding handsome gold bars. It is rumored that Mr. Berger, the former Supt. of the mine, who lately found a good-sized, rich quartz ledge, is about to visit his relatives in New York. He recently had his mines surveyed by Messrs. Davis and Hendel, and proposes with his nephew, Mr. Winters, to work the mines as soon as the snow will permit. Their claims are supposed to be an extension of the well-known Young America mine, owned by Messrs. Busch, Deidesheimer, Sunderhause and Huges, and are located near Packer Lake. The Young America Company are working four men, driving their lower tunnel along the rich prospecting lode towards the summit, between Packer and Sardine Lakes, and will have their mine well opened by next spring, so as to have enough quartz developed to run their proposed mill. The Mountain lode, owned by Mr. H. Warner, on the same quartz belt as the Young America, shows rich rock and will be largely developed next spring by its owner. The Beard brothers intend to extend their lower tunnel on the celebrated Phœnix mine, near the Sierra Buttes, toward their rich lode, which, when properly opened, will give employment to a great many men. The Sierra Buttes Company are steadily driving their No. 9 tunnel on the lode towards the pay chimney.

RICH DISCOVERY.—*Greenville Bulletin*, Dec. 27: From Mr. J. P. Hall, who has just returned from Sierra county, we have the following: Cannon Creek and the other creeks which empty into it not far above Poker Flat, Sierra county, have been exceedingly rich, and some of the points which have been hydraulicked off, have been very rich in quartz gold. Although quite a number of ledges cropped out in the vicinity, for many years they were hardly noticed by the miner, as, with pick and pan, he traveled up and down, looking for sluice or hydraulic diggings. From one of the ledges, however, 18 or 20 years ago, rocks had been crushed with an arastra, but was supposed to have given out, since which time, it has been located by different parties, who did little or no work on it, and then gave it up. The present owners located it more to keep other parties from doing so, and from interrupting with their gravel claims. Last Thanksgiving day, one of the partners discovered gold in the rock where their ditch crossed the ledge. A tunnel was started, and when Mr. Hall was there, it was in about twelve feet on the ledge, but so near the surface, that the ledge was considerably crushed. It is about 4 feet in width. Near the center, he saw rock taken out, which, when crushed in a mortar, yielded ten dollars to the pound. The gold is what Mr. Hall calls foliage gold, of which he showed a sample of nearly one-half an ounce in weight, the pieces having been taken out of less than a pound of rock. They are in the shape of branches, twigs, leaves, and a piece can be seen at this office almost a fac simile of a fern. The name of the mine is the Belmont Consolidated, and the discovery is on the point between Smid Horse and Illinois canons. The owners are P. R. Gardner and son, Mike Bowers, Mat Burth, Fred Hammond and Jacob Haas, nearly all of whom are old miners in that vicinity, and well known in Sierra county. We also learn from Mr. Hall, that a week ago last Saturday, a very rich boulder was found in the Redding mine, near Whiskey Diggings, Sierra county, owned by Mr. J. P. Denoon. The boulder was at least five feet from the bed-rock, and the gold was discovered while breaking off a point to make room for the timbers. The rock is twenty-two inches long by fourteen inches wide, and about a foot thick.

Trinity.

DON'T GO NOW.—Trinity *Journal*, Dec. 27: It is only right and human that we should caution prospectors against going to New River at the present time. No prospecting can be done there now; no work can be obtained as the mines now working have all the laborers they require; there are no extra provisions in the district, and we learn barely enough to winter the men now there. Wait until next spring when the snow is gone and all conditions favorable for roughing it and prospecting the rich extent of territory between the East Fork of North Fork and the head of New River.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Dec. 27: The west crosscut on the 2800 is out 66 feet. The face is in a solid body of quartz giving low assays. At a distance of 45 feet from the main north drift this crosscut passed through about three feet of very fine ore—ore assaying from $50 to over $600 a ton. Then west of this it cut an eight-foot streak averaging $12.25 a ton. It is probable that the quartz now being passed through will make another body of ore out near the west wall. A west drift to connect with the bottom of the winze at the 3000 level has been started from the Combination shaft, and is now out 30 feet. The ground is hard but blasts well, and they are able to make 12 feet per day in the drift. As soon as the hydraulic pump starts up the Norcross folks will begin a west crosscut on the 2700 level, at which point a working station has already been opened.

SAVAGE.—The E-street tunnel is in a distance of 620 feet. It has about 50 feet to go to reach the point where it will encounter the northern continuation of the ore body that was worked in the Hale and Norcross. They have recently been passing through a very heavy body of clay (doubtless the east clay of the vein) which, from its swellings, has given much trouble, but are now in a more solid formation. This formation is vein material—a mixture of quartz, clay and porphyry—which presents a very favorable appearance.

COMBINATION SHAFT.—The new hydraulic pump at the 3000 level is set up and ready to run. All now lacking is the pieces of pipe with which to make the connection at the 2600 level. On the 3000 level a west drift has been started to connect with the bottom of the Hale and Norcross winze.

UNION CON.—Good headway is making in the work of cleaning out and repairing the south drifts on the 2300 and 2700 levels. The joint Sierra Nevada east drift on the 2300 level is also being reopened and repaired. As the water rises in the lower levels it forces up to the levels above great quantities of foul-smelling air and gases; however, this bad air is not of a dangerous character, though very disagreeable.

ALPHA.—The drifts on the 600 and 900 levels still continue to pass through solid quartz containing many streaks and bunches of ore. The assays run from $5 or $6 to as high as $60, but no workable body of ore has yet been encountered. The body of quartz is over 100 feet in width and is of a very favorable appearance.

OPHIR.—The west drift on the 500 is now into the ledge of the old workings, and the water is fast draining out. On the 1500 level a winze is being sunk at the end of the west cross-cut from the main south drift to connect with the northwest drift on the 1750 level of the Con. California and Virginia.

CON. CALIFORNIA AND VIRGINIA.—The northwest drift on the 1750 level has at last reached the old workings to the northward of where the fire broke out in the old timbers some years ago, and they are now taking out a considerable amount of ore that will pay for milling.

BEST AND BELCHER.—The west crosscut on the 825 level at the Gould and Curry north line is still in vein material of a very promising appearance. It has yet a long distance to go to reach the west wall. Some of the feeders of quartz encountered give low assays.

ALTA.—Good headway is making in the new east cross-cut on the 1350 level. It is in quartz that promises well. The water is about 30 feet above the 1500 level and is still rising, but very slowly.

GOULD AND CURRY.—On the 825 level the west

cross-cut at the Savage north line is still finding occasional streaks of quartz that give low assays. A large area of ground remains to be explored.

SCORPION.—The north drift from the main west crosscut, on the 500 level, is out about 400 feet. It is still in vein material of a promising appearance. There is no trouble from water.

YELLOW JACKET.—Sufficient low-grade ore is still being obtained from the old upper levels to keep the mills on the Carson river running to their full capacity.

OVERMAN.—Sufficient low-grade ore is being found in the old upper levels to keep a small force of miners employed. About 60 tons of ore a day are being taken out.

ANDES.—The gases from the fire in the old Central tunnel have about disappeared, and the men will be put back into the mine in two or three days.

UTAH.—In accordance with orders from below, work in the mine has been discontinued, there being at present a lack of funds.

BELCHER.—About the usual amount of low-grade ore is being extracted and sent to the mills on the Carson river.

CROWN POINT.—About the usual quantity and quality of ore is being extracted and sent to the mills.

SIERRA NEVADA.—On the 2500 level are reopening and repairing the east drift joint with the Union Con.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Dec. 27: The north cross-cut on the sixth level is now in 79 feet, and a west drift has been started from the station on this level. The west drift on the fifth level has advanced 11 feet, and has shown a foot of $75 ore during the week, while the raise near the face of this drift shows several streaks of ore. On this level, near the foot of winze No. 1, there is a strong ledge showing, but the ore is low-grade. The west drift on the fourth level has advanced 11 feet and shows nothing of value. A small amount of ore is being stoped from between the third and fourth levels both east and west of the shaft. Between the second and third levels, west of the shaft, considerable $70 ore is being taken from a ledge that averages 18 inches wide. East of the shaft, between the same levels, a small amount of high grade ore is being stoped. The intermediate, between the first and second levels, is given some good ore, and a small amount of ore is being taken from the first level.

Eureka District.

THE BOWMAN MINE.—*Sentinel*, Dec. 26: John McAulay, Supt, of the Bowman mine, returned from quite an extensive trip through the East, even to "down in Maine," yesterday morning. One of Mr. McAulay's objects in going East was to confer with the company he represents, their office being in Boston, concerning the present and future workings of the Bowman. After making a statement of the present condition of matters and of the prospects of the future in case deeper exploration in their property is made, the company expressed a decided faith in the worth and future of this district, but said they did not feel themselves justified in making large outlays until the general cost of mining is cheapened. They did, however, arrange with Mr. McAulay to have their shaft sunk 300 feet deeper, which work will be commenced about the 1st of January or as soon as a shipment of cable arrives from the East.

Jumbo District.

LARGE VEIN.—*Silver State*, Dec. 26: A prospector known as "Mormon Dan," is reported as having discovered a large vein of ore in the Jumbo district, some four miles from Ike West's ranch. This district, which was discovered by Dave Buel, is situated about 35 miles due west from Winnemucca.

Lewis District.

ANOTHER MILL.—Battle Mountain *Messenger*, Dec. 24: G. W. Bothwell has purchased J. T. Caldwell's interest in the Pittsburg Con. mine at Lewis, and will immediately build another mill of the same pattern as the one recently put up by that Company. He will also put new hoisting works on the morning Star mine, and proceed at once to take out ore. Mr. Bothwell is a "rustler," and through his efforts Lewis will doubtless come to the front again as a bullion producing camp.

Silver Park District.

TO BE WORKED AGAIN.—Southern Utah *Times*, Dec. 26: Silver Park mining district lies about 65 miles west of Frisco in Lincoln county, Nevada. About 15 years ago this was one of the liveliest camps in Eastern Nevada. A great number of locations were made and enough ore was extracted from the different claims to induce California capitalists to erect a ten-stamp mill for its reduction. Everything indicated at that time that Silver Park was about to become a great camp. Then came the White Pine excitement, and the glowing stories that were circulated throughout Nevada and California of the fabulously rich strikes made in this district, reached the miners at Silver Park. The prospectors caught the fever, pick and drill were cast aside, claims were abandoned and a stampede was started for the new El Dorado. At the time of the exodus from Silver Park, the deepest shaft was not down 50 feet from the surface. Among the first discoverers of this camp was Felix Knight. He had immense faith in its future and stayed with it. For 15 years he has lived there and worked his claims, the greater part of which time he was the sole inhabitant of the camp. His mines improved as a greater depth was reached, the ore became richer in quality, and the ledge proved to be regular and well defined. Mr. Knight was well aware that he possessed a bonanza, and for several years past he has worked to develop his property. Whenever he desired to raise a few thousand dollars, he would go to work and stope out a few tons of rich ore and ship it to the reduction mills at Pioche, or to the smelters at Salt Lake City. Some time during last summer, Mr. John Epply, of Salt Lake, hearing of the property, went out to Silver Park and managed to secure a bond on the mines from Mr. Knight. Mr. Knight passed through here during the first part of the week, on his way to Salt Lake City, where a sale of the property to a syndicate of Eastern capitalists will be finally consummated. We understand that Mr. Knight will realize some $150,000 out of the sale. The property consists of three patented claims, which take in 2,200 feet of the ledge. The ledge is a contact between quartzite and granite. There has been three shafts sunk on the ledge about 400 feet apart, being 100, 250 and 238 feet respectively in depth. The shafts are inclines, having been sunk in the ledge matter. The ore has been exposed from the top to the bottom in each of the shafts, Mr. Knight having followed the ore when prospecting his property, and drifts have been run east and west on the ledge from the shafts at different places. At the bottom of the 250 foot shaft on the Sam Tilden, a drift has been run for a distance of 300 feet. The ledge is eight feet in width, through which runs four feet of clean ore, which samples 245 ounces silver to the ton. The ore is quartz bearing horn and native silver. We have seen specimens taken from the mines which will assay over 1,000 ounces. Mr. Knight has made shipments from the mines which sampled over 1,000 ounces to the ton. Barney Mulhall, who came in with Mr. Knight, says that the company has leased the old mill which will be repaired and put in running order in a short time. There is between $12,000 and $15,000 worth of ore on the dump, and several hundred tons exposed in the different workings of the mine ready to be stoped out. Active operations will be started as soon as the mill is in proper working order, which will be soon after the 1st of January, 1885. Silver Park has all the natural facilities requisite for a prosperous mining camp. There is any quantity of wood and water, and, what is more desirable, an abundance of mineral. The ore is free milling and rich in silver, so that the camp will not be handicapped with the low price of lead, and the uncertainties arising from the tariff question, which are interfering to so great an extent, with the prosperity of base bullion mining districts at the present time.

Sprucemont District.

ORE.—Cor. Eureka *Sentinel*, Dec. 30: I was not heedless of what I saw. I know that I saw immense bodies of ore, the capacity or solid dimensions of which have been estimated by actual measurements. They exceed in extent and assay value the most favorable showing ever made in any mine on Ruby Hill or Eureka district. The class of ore is very much like the Eureka ore, but the ledge, so called, seems to be more definitely placed, which fact, in my judgment, adds strength to the permanency of the lode.

ARIZONA.

MINING NOTES.—Prescott *Courier*, Dec. 26: Mr. John Ensign, who has just come up from Hunibug district, says his pack train is kept busy moving ore. All chloriders in the district are making money. Mr. Cover, superintendent of the St. Louis Company, has gone back to the mill. Snow is very deep in Bradshaw district. Miners will lose some of their animals. Mr. Thomas S. Livermore, from Swansea, Wales, has come to Arizona, to examine copper properties. A new district has been formed in Yuma county. It is about 30 miles east of Castle Dome. Hugh Tighe, who has just come in from the head of Hassayampa, says that A. J. Head recently discovered a ledge containing silver, which shows well. Mr. Tighe, like all miners who have examined Dave Grubb's mines, believes them to be as good as the county can boast of. J. T. Weber has returned from doing assessment work on the Compton and Poorman mines. The former belongs to Messrs. Sines and Kirwagen; the latter to Jas. Guild. Ore taken out is very rich in silver.

PIMA COUNTY COPPER.—*Sunshine and Silver*, Dec. 26: The Sierrita copper mines are a group of about 30 mines, situated 30 miles south of Tucson. The result of two weeks' work on the Sadie, one of the claims, by one man is a ton and a half of ore, that goes 50 per cent in copper. Ore is now being taken out for shipment. The principal owner of the mines is Geo. H. Spears, of Tucson. This property is said to make an equally good showing, for the development done, to any copper mines in the Territory.

GOLD HILL ITEMS.—*Silver Belt*, Dec. 29: Gold Hill and Lost Gulch district, although little known, is one of the richest mineral sections of Gila county. It is distinctively a gold district and possesses several very promising claims which are now being developed. The Genevieve and Manzanita owned by Messrs. Webster and Winne, are developing finely. Mr. Winne, who is now at work on these claims, is taking out good ore. The vein in the Manzanita is said to be from three to four feet wide, and assays well. Mr. Winne also owns the old Munson claim, from which he is getting rich rock. W. V. Kingsbury is doing assessment work on the Eureka, in Lost Gulch, which is also a gold bearing claim and has produced considerable rich ore. Ed. Lidolph is taking out ore from the Golden Eagle, which he intends soon to have worked. The last ore milled, from this property, yielded a average of $50 per ton. This district is destined to attract considerable attention in the future.

SALE OF A QUIJOTOA MINE.—Globe *Chronicle*, Dec. 26: Gen. A. A. McDonell, a resident of Los Angeles county, Cal., and the principal owner of the Buffalo mine, of Globe district, who is on a visit here in the interest of the Mineral Belt railroad says, that he is conversant with the facts concerning the following sale of a Quijotoa mine. "Robert Martin traded a one-quarter undivided interest in the Palo Verde mine, Quijotoa mountains, Arizona, for 80 acres of valuable land at Ontario, Ontario colony. As no land at Ontario can be purchased for less than $150 per acre, this sale of the mine is based on a cash value of $50,000. H. B. Botsford is the new partner in the Palo Verde, and is well satisfied with trade. Mr. Martin is negotiating for a cash sale of the Jersey Lily mine in the same district to a stock company here. General McDonell says that last year he purchased a tract of land in the same vicinity at $100 per acre, and he would not sell it now for $150.

COLORADO.

OUR DOTS FROM DUMONT.—Colorado *Miner*, Dec. 20th: The storm of the past week makes one believe that winter has indeed come. Notwithstanding the heavy fall of snow, the activity among mines of Crystal mountain remains unabated. The Dew Drop grows better every foot that is driven. Level No. 1, run from the bottom of the main shaft, is now over 30 feet in length, and is being pushed ahead at the rate of about three feet per day. There is a very perceptible improvement in the quantity of the ore now being extracted. The pay crevice has widened considerably since our last report. The shaft house is nearing completion rapidly, and will be ready for occupancy in a few days. Colonel Irvine, the lucky owner, informs your correspondent that a large shipment of the first and second class mineral will shortly be made. The Colonel has a number of other claims in the vicinity of the Dew Drop which promise well. The miners throughout the district are working hard to place these mines in condition for shipping large quantities of ore. Everything betokens a prosperous and successful season for our "treasure vaults."

Elk Mountain Pilot, Dec. 25: A section of coal land this side of the A. M. C. Co's breaker, belonging to Frank Chapin, J. B. Thompson and Ricketts & Barnes, was sold a few days ago to a syndicate of capitalists and railroad men living in Ohio and Michigan. The consideration is not made known to the public. Mr. E. E. Dwight, of Detroit, Michigan, representing the syndicate, was here about three weeks ago, and on inspecting the land, closed the sale immediately. We understand that the syndicate being composed of railroad men, they entered into an arrangement with the D. & R. G. R. R. to carry their coal at a rate that was satisfactory to all parties. Alexander boys are in town, from Poverty gulch. They will work the Hawkeye mine all winter. Assessment work is being done on the Terrible on the south slope of Sheep mountain, which shows a large vein carrying brittle silver, copper and iron. The Forrest Queen, Great Eastern, Bullion King and Ruby Chief are the only mines that are doing any amount of work in Irwin this winter. The Great Eastern is taking out some very good mineral at present. In the Forest Queen they are taking out ore between the surface and tunnel level and running the concentrator with it.

IDAHO.

YANKEE FORK.—*Ketchum Keystone*, Dec. 25: Last Spring, in digging a ditch from Paradise gulch to bring water on the ridge back of Mr. Morrison's house for the purpose of washing a gravel knoll, very rich gold and silver float was thrown out. In washing the gravel bank, a good many large nuggets were found, ranging from one-half to five ounces in weight, and many large pieces of quartz with gold, were found. After the placer season was over, Mr. Morrison turned his attention to the source from where the quartz and nuggets came. Starting a cut at the head of the bar he soon broke into a quartz vein, similar to that of the south vein of the Dickens, but richer than the Dickens. The ledge is a couple feet wide, and the rich ore vein about eight inches. The quartz in sight is rich in gold and silver—the gold in wires and nuggets, and the silver in masses of sulphurets. It is believed that with a hand mortar one man could pound out a thousand dollars a day. He has one piece of 30 pounds that is literally full of gold. He was offered $1,000 for the privilege of knocking out one piece of ore in the face of the drift, but refused it. Just two years ago today I sat out in a snow storm nearly all day making a sketch of the same ground for parties who had in view the purchase of the property. It was bonded then, but the bond was allowed to expire. Since then Mr. Morrison has tried hard to sell the ground, but to no purpose. Now parties are after it, and if they get it they will pay for it. This new strike of Morrison's adds value to the Dickens, as it is on the same vein, but on the west side of Jordan from the Dickens. The vein can be traced from one hill to the other. There have been two or three discoveries between here and Custer, in the vicinity of the Dickens mine, some of the ore assaying as high as 240 ounces per ton.

TERRITORIAL NOTES.—*Ketchum Keystone*, Dec. 24: There are four men at work on the Muldoon mine, and in all there are 20 men in the camp. English capitalists are examining the Coeur d'Alene quartz ledges with a view to buying. Gen. Cunningham and others of Bellevue, are making good shipments of ore from the Deadshot, which they have under lease. An ore sampler is to be one of the new Bellevue enterprises. There is plenty of work for one there.

THE DEER TRAIL.—Idaho *Keystone*, Dec. 25: Frank Lemon, of the Deer Trail Mine, on the head of Warm Springs Creek, left the first of the week for a visit to his home in Indiana. He left with us a piece of Deer Trail ore weighing 104 pounds, for the New Orleans Exposition, before leaving. It samples nearly 250 ounces. The Deer Trail, with three men on ore, shipped nearly 50 tons to the Philadelphia smelters here during the fall, the average net yield of which was about $145 per ton. The ledge is two to three feet in width, and carries a low per cent of lead and high average of silver. Houses were built at the mine the past fall, and supplies laid in for the winter. Mr. J. W. Platt, partner of Frank, is at the mine with a force of men, taking out ore. The vein was recently struck in the main tunnel, which leaves a great deal of ore in sight. A few weeks since Messrs. Platt & Lemon could have taken $25,000 for the Deer Trail, but would not take $30,000 for it since the strike was made in the tunnel. That is the way the mining lottery goes. Last spring the Deer Trail owners were prospectors—to-day they are rich mine owners, with an abundance of ore in sight that samples from 140 to 280 ounces per ton. They will have much ore no ship next season. The mine is situated on the divide between Smoky and Warm Springs, and are a rich mineral belt.

SOME MINES OF IDAHO.—Idaho *Statesman*: Several Eastern journals allude to the Coeur d'Alene mines as worthless, and say that the excitement aroused by western papers and advertising bureaus in regard to the mineral deposits of that region, was bogus. These eastern periodicals are laboring under a serious misapprehension of the facts. The Coeur d'Alene country has disappointed no practical miners who went there properly equipped to withstand the rigors of that northern climate and get at the real resources of the place. To be sure, not every one who went there to seek a fortune has been successful, but the fact has been demonstrated beyond the possibility of a doubt, that the precious metals are there in abundance, and not a few paying claims have been found which have not only already yielded large quantities of gold, but promise even better results in the future. It is also alleged by some of our eastern contemporaries that the "Seven Devils" country, north of Weiser, which has recently attracted well merited attention as an unexplored region full of great promise to miners, it being advertised merely for the purpose of victimizing the public. Nothing could be more absurd. What possible object could any one have in creating false excitements of this kind? The facts are that this Seven Devils country, in spite of its bad name, is exceedingly rich in minerals. But it must not therefore be supposed that every one who goes there with the intention and expectation of making millions will be successful. In the best mining lands ever discovered some have been disappointed even where many have been successful in the highest degree. The Seven Devils country has not as yet been thoroughly prospected, but enough reliable information is at hand to warrant the assertion that fortunes will be made there in the near future.

OREGON.

WORKING.—Jacksonville *Times*, Dec. 22: Many of the miners have commenced to do a little work already. Gin Lin of Uniontown has a fair supply of water and is husy piping. The miners are generally well prepared and expect to make a better showing this season than they have for several past. Wimer & Sons are operating two pipes in their claims near Waldo, and other miners in Josephine county are also at work. The Southern Oregon Development Co. has 500 tons of low-grade ore ready to ship from this county to the reduction works in East Portland. The iron and copper mines of Jackson and Josephine counties are rich and extensive, and must sooner or later command the attention they deserve. Geo Schumpf informs us that some capitalists will soon arrive from Portland for the purpose of examining his quartz ledge in Willow Springs precinct. John Miller, who has one of the best hydraulic mines in Southern Oregon, has everything in shipshape for a big run and will commence work this week. Green Bros. of Galice creek, who have one of the best quartz ledges in the State, recently bonded it to parties from abroad for the sum of $20,000, we learn. The transfer of the property is expected to take place before long.

NOTES.—Jacksonville *Times*, Dec. 26: Miners are happy everywhere and anticipate largely on the future. Frank Smith will work Marshal Curtis' mines on Jackson creek this season. Greater activity than ever is noticeable in the mining districts of Southern and Southwestern Oregon. Wm. Bybee's mine near Waldo is running on full time, as also is Bybee & Hall's claim on Canyon creek. Keaton & Klippel of Poorman's creek are already favored with a fair supply of water and have their pipe in operation. The Sterling Mining Co. had everything in readiness when wet weather began and is piping with a full head of water. Miners in Josephine county are greatly encouraged and will make a good report. Some of the best mines in the State are located in that section. A considerable quantity of snow is already piled up in the mountains, which will come handy in the spring. No doubt plenty more will fall yet. Ingram & Dean of Willow Springs have commenced ground-sluicing. They recently purchased the mining claim formerly worked by the late John Ambrose. Jas. Eaton, who is now engaged in mining on Dividend Bar, in the big Applegate section, struck good prospects and has taken out a nice lot of gold, including a few nuggets of fair size. Piping has commenced at John Miller's extensive mining claim on Farmer's Flat, where great preparations have been made for the season's run. A good report may be expected from that mine. H. H. Magruder of Rock Point was in Jacksonville Tuesday, from whom we learned that many of the miners in that vicinity have sufficient water to commence operations, and that a good mining season is promised. To all appearances this will be the best mining season Southern Oregon has experienced for years. No wonder that the miners are in high spirits. Many thousands of dollars will be taken out if the stormy weather continues, and affords a good supply of water for the next few months. There would be quite a difference in the financial affairs of this and other vicinities in the event of a protracted wet season.

UTAH.

COPPER GULCH.—Southern Utah *Times*, Dec. 20th: Since the Comet and Cactus mines were closed last winter, Copper Gulch was practically abandoned. The Morrison Brothers, Charles and Loren, after a short visit to the East, returned to Frisco. Within the past few weeks they started on their own responsibility to prospect on the Comet ground, and with such success as to show that their theory of the situation of the ledge was the proper one. About 40 feet east of the new shaft and midway between the hoisting works and the discovery shaft, they started to sink on what they claimed was the ledge. They found ore on the surface, but in a very decomposed state, and mixed up with the country rock. They continued to sink, and the ore improved at every stroke of the pick. They are now down to a depth of 15 feet. The ore has become compact, and has widened out to the full width of the shaft, which is 4x5 feet. What the extent of this ore body is, can only be found out by prospectiug. The indications now are that they have struck a large chimney of ore. The clean ore assays 20 per cent copper and 120 ounces silver to the ton, and an average assay taken from the bottom gave a return of over 50 ounces silver and 10 per cent copper. This property should not be allowed to remain idle, and we have no doubt that if the managers of the Comet Company had a proper understanding of the value of their property, they would not hesitate a moment to begin active operations to develop the mine.

REVIEW.—Salt Lake *Tribune*, Dec. 26: The week has been a strange one since Saturday, and the trains have been much delayed, but no perceptible effort has been shown in the shipments of the metals. The shipments of ore and bullion from this city for the week ending Saturday, Dec. 29th, inclusive, were as follows: 56 cars bullion, 1,357,419 pounds; 40 cars ore, 1,145,550 pounds; 1 car lead, 20,000 pounds; total, 97 cars, 2,522,969 pounds. The receipts of bullion and ore in this city for the week ending Dec. 24th, inclusive, were: Bullion, $139,290.07; ore, $15,816; total, $155,106.07. The receipts the week previous were $153,560.13, of which $127,864.13 were bullion, and $25,696 ore. The output of the Horn Silver for the week was 17 cars of bullion, $42,500, bringing the total output for the year up to $2,759,000, which may prove to be slighly over the true figure. The product of the Ontario for the week was 69 bars of bullion, $44,155.74; total for the year, $1,658,795.28. The product of the Hanauer for the week was eight cars of bullion, of the value of $20,250. The Germania sent out during the week seven cars of bullion, $11,540.33.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

Of the City of San Francisco.)

PREMIUMS AWARDED.

HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

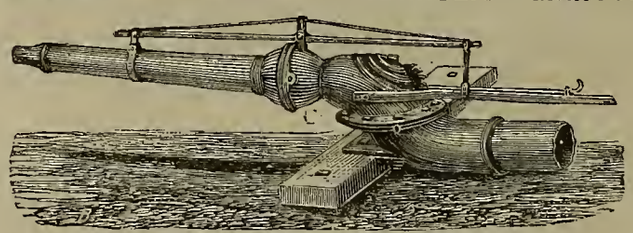
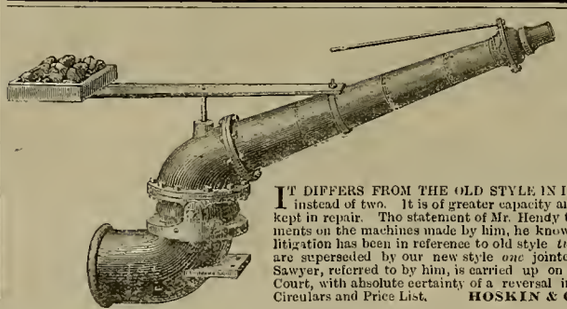
IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All other styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.



THE CUT REPRESENTS OUR

IMPROVED

HYDRAULIC

MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Send for Circulars and Price List. HOSKIN & CO., Marysville, Cal.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHO. SALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1887.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, cloth, postage free.

INTEREST IN A QUARTZ MINE.
I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address
A. CHAMBERS,
Jackson, Amador Co., Cal.

The California Perforating Screen Co.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

HERCULES SLAYING THE GIANT.

HERCULES POWDER
Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.
PATENTED IN THE UNITED STATES PATENT OFFICE

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

Mining Share Market.

There is not much animation in the stock market. Attention is just now turned to the middle mines of the Comstock. The Virginia papers say they have found a 3-foot streak of very rich ore on the 2800 level of the Hale and Norcross. This ore assays from $50 to over $600 a ton. There is a chance for a bonanza between the 2800 and 3000 level. The ore streak is widest and richest in the bottom of the crosscut, showing that it is making downward; also there are indications that it is making to the northward. A drift has been started from the 3000 station of the combination shaft, to connect with the bottom of the Norcross winze. The new hydraulic pump will be working soon, when a crosscut will be commenced at the 2900 station of the Norcross.

At the Sierra Nevada, Union Consolidated and Mexican they are cleaning out and repairing drifts, preparatory to the resumption of explorations from the 2700 up to the 2300 level.

The leading Gold Hill mines continue to extract sufficient ore to keep the mills on the Carson river in full blast. The Overman is still taking out a considerable quantity of paying ore. At the Alta they are driving a crosscut to the east on the 1350 level. This crosscut is in quartz of a promising appearance.

Bullion Shipments.

Oro Grande, Dec. 26th, $4,212; Hanauer, 25, $5,200; Queen of the Hills, 25, $1,300; Germania, 25, $6,450; Horn Silver, 25, $10,000; Ontario, 25, $15,202; Christy, 25, $1,708; Germania, 27, $11,039; Ontario, 27, $9,556; Horn Silver, 27, $22,500; Christy, 27, $1,620; Horn Silver, 28, $10,000; Germania, 28, $3,485; Hanauer, 28, $2,700; Crescent, 28, $2,600; Queen of the Hills, 28, $1,450. The banks of Salt Lake City reported the receipt for the week ending December 24th, inclusive, of $139,290.07 in bullion and $15,816 in ore; an aggregate of $155,106.07

A NEW gold country has been found at Sandy Point, in the Straits of Magellan. That the alluvial deposits there are auriferous is well known, and there is every reason to believe that the precious metal is to be found distributed all over that part of the Chilean territory. Washing is carried on by the country people in the most primitive fashion, and without the use of quicksilver, and with these rough appliances they succeeded last year in extracting 15,000 grammes of gold, which was sold on the spot at 54 cents per gramme, representing $8,000. The yield for the current year is expected to be much more important. The gold is principally found in the rivers, as dust, and in nuggets.

Our Agents.

THE Pioche *Record* says: The prospectors are putting in their summer supply of water. They are piling the snow up high on the mountains and covering it with brush. They devoted most of the past week to gathering snow, and a number think they have a sufficient quantity to last until June or July, and they can afford to take a bath every other month.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Building Material.

Lime, per barrel, $1.50@$1.60. Plaster, $2.75-3.00. Eastern Plaster, $3.00-3.25. Rosendale Cement, $2.25-2.75. Portland Cement, $3.50-3.75. Fire Brick, per 1,000, $40 @ $45, according to brand; hard, $10.00@$12,00; red, $8.00@$8.50; soft, $7.50; face, $30.00.

THE Plymouth Consolidated Gold Mining Company has just declared its nineteenth consecutive monthly dividend of $50,000, or $950,000 in all. This company is now running both its mills on full time—120 stamps. The entire machinery is run by water, which belongs to the company. The lowest level of the Plymouth is 1,300 feet down, and the ore chimney is 450 feet long by 35 feet wide. This mine is now the largest gold mine in North America, and paying more in dividends than any other. There are large bodies of ore uncovered, enough to keep the present mills occupied for several years. A new level is also to be opened during the coming months.

News in Brief.

TWENTY miles of wire on the California and Oregon Telegraph is down, doubled up by sleet.

GREAT excitement has been created in Georgia by the discovery of silver near Fort Mountain.

IT is said that never in the memory of any living man did Christmas close in England in deeper gloom.

THE municipal authorities of Paris have agreed to vote 60,000 francs toward the Grand Prix, which will be run in June next.

THE Great Eastern is still being prepared for sailing for New Orleans. Grave doubts are entertained as to whether she is seaworthy.

A COLORED man and woman of Newport have drawn $1,000 from a savings bank and gone to Canada, because of a fear that they were in danger of being re-slaved.

PROHIBITION is such an utter failure in Kansas that legislative action is expected very soon on the question. The liquor laws, as they stand now, are totally inoperative.

SEVERAL prominent business men of Pittsburg have decided to organize a stock corporation for the purpose of erecting and maintaining an exposition building in that city.

NEW YORK fashionables are reputed to have sent forth the edict that flowers are to be banished henceforth from society gatherings, operas and theaters, as well as funerals.

ON Christmas afternoon the electric light mast on the corner of Buena Vista and Short streets, Los Angeles, succumbed to the action of the continued rain, and fell with a crash.

THE raising of the age at which a child can be admitted into the public schools from five to six years, is being agitated in New York, and the introduction of a bill into the Assembly to that effect is talked of.

THE monument to Kit Carson, General Fremont's famous guide, is about completed, and will arrive at Santa Fe this week. It is understood that the inaugural ceremonies will take place on Decoration Day.

A PEARL weighing 93 karats, the largest known, and valued at $17,000, was found by an Indian diver at Mulege, Lower California, recently, and sold by him for $60 to a person who shipped it to London.

THE plea of a Nashville negro, convicted of butting an enemy almost fatally, was that in infancy he had been fed on milk from a notoriously belligerent goat. The Judge said he could not regard that fact as an extenuation.

THE Direct United States Cable Company and French Cable Company made a reduction in the cable tariff to Great Britain, Ireland and France to 20 cents per word. The reductiou was caused by the competition of the Mackey-Bennet Cable Company.

A SOUTHERN Pacific East-bound train was boarded on the 23d iost., near the Pecos river crossing, by a baud of druukeu cowboys, who amused themselves by firing their pistols through the car windows aud roof and otherwise intimidating the passengers.

DESPITE the arrest and expulsion from the Republic of certain Mormon missionaries who made themselves obnoxious to the authorities, the work of recruiting in the iuterest of the Utah religion continues with great activity in Switzerland.

BOTH of the Nevada Senators and Representative Cassidy are considerably annoyed in answering the questions put to them about the possible extinction of Nevada as one of the States of the Uniou, as tbe entire press of the East is seriously discussing the effect of a State being takeu out of the Union.

WANTED—SITUATION.

A young Chemist, graduate of Germany, who speaks German, English and French, and who has worked at furnacer and in steel works in Belgium and England for several years, desires a similar position in this country. Highest references given. Address FELIX BECKER, ARLON, BELGIUM, EUROPE.

About Obtaining Patents.

Patents are Virtually Contracts

Between inventors and the public. The consideration flowing from both parties to the contract is expressly fixed by statute. The Government requires the following consideration in every case: First, that an applicant for a patent shall disclose a new and useful improvement, of which he is the first and original inventor. Second, that the invention has not been patented, or published in a printed publication prior to the date of his invention. Third, that the invention has not been in public use, or on sale, more than two years prior to his application for a patent. Fourth, that the invention shall be properly described and claimed in the specification forming a part of the patent. Provided an inventor complies strictly with these conditions, the Government guarantees that the inventor shall have the exclusive right to make, use and sell the thing invented for the term of seventeen years.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. This question can often be answered gratuitously by us, immediately on receiving full information of the invention, by reason of our long and extensive practice as patent solicitors and editors and publishers of first-class, scientific and industrial journals, during the past 20 years and over. When the question of priority of invention is not so readily to be determined, it is generally best to make what is termed a "preliminary examination," by searching through the patent office reports among the patents in the class to which the invention relates, and referring to our extensive patent library, containing compilations of special classes of American and foreign inventions, mechanical dictionaries, scientific encyclopedias, files of scientific and mechanical newspapers, and an enormous number of patent applications by inventors of the Pacific coast, carefully filed by this office since 1860.

If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely whereby his invention has been anticipated, thereby saving him further expense and perhaps much time, useless delay, anxiety, etc.

To avoid all unnecessary delay, however, in securing patente at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately, and forwarded to the inventor for his signature. When the inventor receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. (This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary stepe to be taken.) When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretence of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give a case up as long as there is a chance to obtain a patent. The Agency charge is from $25 to $30, or sometimes more, if the invention is intricate or complicated, or requires much labor. Drawings cost from $5 upward, according to their number and the time employed, and, if a model is sent, the express charges upon this and the papers must be added. The total cost, in addition to Government fees, rarely exceeds $40, and for this we do all we can without appealing the case.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are considered more satisfactory to the Patent Office than the old and more cumbersome system of storing up an immense hulk of almost numberless models.

Drawings or sketches, sufficient to illustrate clearly the invention, with a sufficient description to enable us to make a full set of perfect drawings for the Patent Office is all that we require. A model will answer our purpose as well however, in cases where the inventor can more easily furnish it for our use.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or very poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention while in reality it may be of great value, and would meet with ready sale had the invention been fully portrayed by artistic and skillfully executed drawings. Again, when patents of this character are brought into court, the uncertainty and ambiguity of the drawings enable the opposing experts to mystify the judges as to the construction or combination of parts intended to be covered by the patentee. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken that the invention is fully and clearly shown by different views, so that the improvement will be readily understood by the Examinere in the Patent Office, and comprehended by the public when the patent is granted.

In the Patent Office

The application is assigned to the Examiner having charge of the class to which the inventiou relates. The case must then take its turn with others in the order of filing, and in due time is carefully examined to test the novelty of the invention. If the examiner fails to find anything that anticipates the invention, a patent is immediately allowed, provided the specification and claims are drafted in proper form. Should the Examiner find a prior patent which, in his opinion, anticipates one or more of the claims in the application, a letter of rejection is sent to the attorney in charge of the case; and, if the attorney coincides with the views of the Examiner, the claims rejected are erased. In preparing applications for patents, an attorney should be careful to familiarize himself with the class of inventions to which the application pertains, so that the specification and claims may be drafted as nearly perfect in the first instance as is possible. This course saves much time in prosecuting the application to a patent.

When claims are improperly rejected on patents which do not anticipate the spirit or wording of the clems, proper steps are immediately taken to convince the Examiner of his error. This is done, in most part, by personal arguments, as the differences in construction, operation, function and results are more readily discovered and appreciated by an oral presentation of the facts than can possibly be done by relying solely on written arguments. In order that the Patent Office record of the patents shall be complete, an oral argument is generally supplemented by a manuscript brief, that others, in examining the files at any future timer may clearly comprehend the position taken by the Examiner and attorney in prosecuting the case to patent.

In addition to our own personal attention to the interest of our clients here, we have, for over 12 years past, had constantly in association with us in Washington, one of the soundest legal counselors and ablest of practitioners in patent business in this country, who carefully attends in person to our business at the Patent Office, and has attained success in a most marked degree.

Perfect Claims.

The value and force of a patent are dependent on its claims. A patent may disclose to the public the most important and valuable invention, and yet the claim be of such meager scope that the patent is actually worthless. When the claims of a patent are so loosely drafted that infringers can flood the market with improvements, differing from the improvement disclosed by the patent only in slight changes in construction and arrangements of parts, such a patent is valueless to the owner, as it fails to afford him that exclusive and complete protection guaranteed by the Patent Law. Hence it is that the greatest care, skill and perseverance are required, first, in properly drafting the claims in the first instance, and second, in prosecuting the application before the Patent Office, and maintaining the rights of the inventor to claims as broad and sweeping as the invention will warrant. This latter is no easy task. The Examiners of the Patent Office serve in the capacity of attorneys guarding the interests of the public. It is their sworn duty to exercise the greatest care and watchfulness, that patentees do not secure claims of greator scope than they are justly entitled to. It is but natural that Examiners are sometimes in error as to just what scope should be accredited an inveution. Although the Examiners act under honest convictions in cases where they refuse an inventor his just rights, yet it is the duty of the attorney to maintain the claims of his client, if he is convinced that they are just and proper. To succeed in this requires the display of tact, firmness and ability; and when the Examiner is made to see that the inventor is honestly and fairly entitled to the claims which have been rejected, he will almost invariably recede from his former action, and allow the case.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. (continuously editors and publishers of the MINING AND SCIENTIFIC PRESS, nearly from its early commencement in 1860) offer comparatively far better facilities to the local inventors of the Pacific States and Territories than are possessed by any other agents in America. Members of the firm give personal attention to the applications entrusted to their care. They have been longer in practice in patent soliciting than most agents who are still personally engaged in the business. They have secured more U. S. and foreign patents in the past 20 years (with very few exceptions) than any other firm still existing. Their practice has been so successful and long continued, that the great majority of inventions on this side of the American continent have been patented through their agency, thus affording them great and valuable experience, by thorough information of the true principles and points of novelty in the inventions, whether general in character or peculiarly local to this coast.

The extensive business combination and experience of this firm is undoubtedly one of the most fortunate in existence for affording inventors prompt and reliable advice, and the best possible facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation that is best calculated to widely inform the class of readers most especially interested in the subject of his invention.

Saving of Time, Etc.

Inventors on this coast will find that owing to our familiarity with inventions and local affairs of this coast, we can more readily and fully comprehend their wants, and thus save much of the time ordinarily consumed in preliminary writing back and forth when distant agencies are employed.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we only require a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves, or for them by other agents), who desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so.

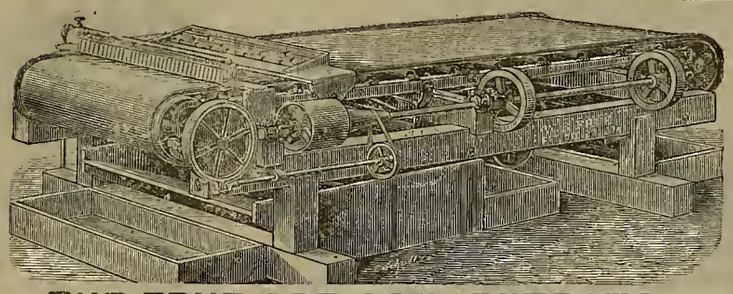
SAN FRANCISCO TOOL COMPANY, - - 11 Stevenson Street, S. F.

C Hendel apr24 '85

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and results to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

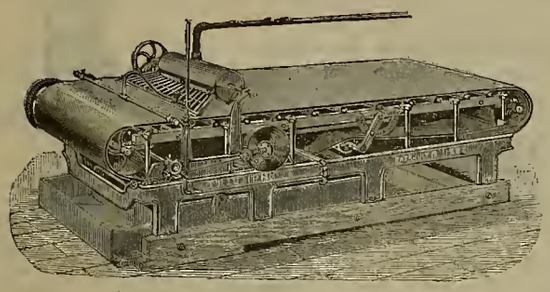
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue' Vanning Machines,** at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000,** flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

A Gas Assaying-Plant.

One of the characteristic steps in the march of modern scientific progress is the substitution of improved time-saving and labor-saving appliances for the antiquated and, in most cases, inconvenient forms of chemical and physical apparatus used by the earlier experimenters. This fact is strongly impressed upon us when we consider the question of the employment of illuminating-gas as a source of light, heat and power. Concerning its value as a light-producer, let the record of the past three-quarters of a century speak for itself. As a factor for power, we have evidence of its efficiency in the shape of the gas-engine. But its adaptability as a medium of heat, in a special direction, viz., the assaying of ores, is a feature to which Walter Lee Brown, of Chicago, Ill., recently called the attention of the American Institute of Mining Engineers, as follows:

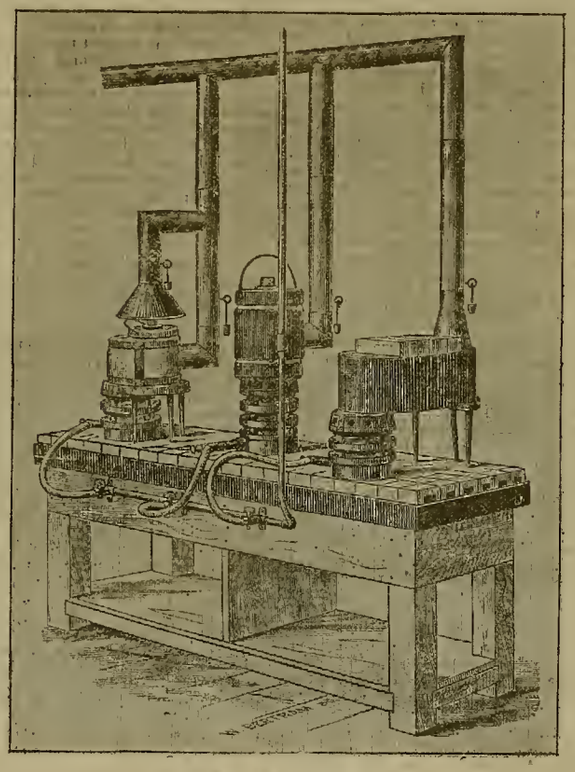
Gas assay-furnaces have been known and used for some years, but not to any very great extent, in this country at least. Therefore no apology on my part is required for the description I now give of a complete gas assaying-plant.

The illustration accompanying this is a faithful representation of the group, as it was designed by, and arranged for Mr. Brown, and appears in actual running order in his laboratory to-day. Its duty is to do roasting, crucible-fusion, scorification and cupellation. The furnace at the left is for roasting sulphurets or other ores for experimentation or actual work. It is what is known as a Fletcher No. 163, and consists of a fire-clay body strapped with sheet-iron bands and a burner (No. 16 Fletcher). The opening at the top (protected when not in use by the cover shown) permits the heat to have full play upon the roasting-dish placed upon it. The heat and flames pass from the burner through the furnace, and out and up the chimney-pipe. The funnel-shaped pipe on the cover is to catch and draw the fumes up the chimney. When the burner is lighted a powerful draught ensues, carrying all odors and fumes at once away. Both the pipe and hood are provided with dampers, controlled by small weights. The burner is connected to the gas-tray by stout ½-inch rubber tubing. A cast-iron tripod supports one end of the furnace and keeps everything firm.

Next in regular order (supposing a sulphuret ore to be under treatment) is the middle furnace, for crucible-fusions. This likewise consists of a furnace and burner. The latter is a Fletcher, No. 15, of the same construction, however, as the No. 16. The furnace proper is made in five parts—the central section (a cylinder of fire-clay); the bed-plate upon which it rests, and which has an opening for the flame to pass through; the cover (with handle attached), which also has an opening filled by a plug—all of fire-clay; and, finally, a plumbago lining. The rubber tube, chimney-connection and damper are like those of the other furnace.

Finally, at the right is shown the furnace for scorification and cupellation, which I have, I think fitly, designated as the "Monitor." Its form is almost that of the reverberatory furnace, the movable bricks, when in place, being the roof. Looking at it from another point of view, it may be considered as a muffle, with the flame as well as the heat inside. Its exterior dimensions are as follows: Length, 20 inches; width, 7 inches; and depth, 5½ inches. In the interior, upon the bottom, are four little wedge-shaped bridges of fire-clay, which are movable; and upon these rests a false bottom or floor, also movable. The latter corresponds to the muffle-bottom of an ordinary furnace, and upon it is done all the work. It is 3½ inches wide by 7½ inches long and ½ inch thick, and has a shoulder or bench running across its entire width on the end nearest the burner. The covering brick, 4 in number, are each 7 inches long by 2¾ inches wide and 1¾ inches high, with a slotted bridge for convenient handling. The series of 6 air tubes or chambers running its entire length. The spaces between the tiles are filled with a mixture of plaster of Paris and Venetian red, rubbed up together with water. The latter color is also used for the tiles themselves, and somewhat on the fire-clay portions of the furnaces. A ⅜-inch gas-pipe, with proper taps and nozzles, is screwed to the front of the table.

I have gone somewhat minutely into detail in the above description, for the benefit of such as may care to duplicate the outfit.



A GAS ASSAYING-PLANT.

connections are similar to those of the first-mentioned furnaces.

The 3-inch stove-pipes of all three furnaces are fitted into one long, horizontal pipe, which fits snugly into the chimney. The bench or table upon which rest the furnaces described, is made of pine, well-seasoned and firmly joined, to resist as much as possible the warping influence of heat, and to support the weight of the furnaces and table-tiles. In dimensions (not figuring on the top, which overlaps 1 inch all round), it is 4 feet 6 inches long, 1 foot 7 inches wide, and 2 feet 1 inch high, plus the thickness of the top, which is 1¾ inches. A double coat of shellac varnish is its sole ornamentation. To the sides and ends of the table-top are firmly screwed 4 strips of band-iron, 2½ inches wide, and ⅛ inch thick, and of such lengths as to alternately overlap at the angles, making smooth joints. The top of this sort of wall is ¾ inch above the bed of the table. Upon the latter are 114 fire-clay tiles, or rather clamps, such as are used to join house-tiles, and having the shape ⌐¬. Their average size is 3½ inches by 3 inches across, and 1¾ inches high. They are so arranged on the table as to leave a

The manner of operating the furnaces is simple. As regards the roasting furnace, it is necessary merely to shut off the dampers of the other furnaces, turn on and light the gas, and regulate the heat to suit the particular ore. The control of the mixture of gas and air is effected by means of the milled handle at the burner. In using the crucible-furnace, remove cover, turn gas on full at tap, light, and regulate by milled handle. Crucibles containing charges that are to be heated gradually can be placed in the furnace as soon as lighted; others, after the lapse of a few moments to allow the furnace to become thoroughly heated. Placing the charges in cold, I have made good fusions of refractory ores in 25 minutes from time of lighting. The furnace will take crucibles in size up to the Battersea "S" (4½ inches across by 5 inches deep).

Finally, as to the "Monitor" furnace, I wish to say a word of explanation. It is not my intention to claim originality as regards this furnace, but merely superior applicability and decided improvements in form. It was Mr. Thomas Fletcher, of Warrington, England, to whom we are indebted for so many ingenious forms of apparatus for the utilization of illuminating gas as a medium of heat, who devised the original little furnace which I employed successfully in assaying for a year and a half. This is the one I now employ as a roasting furnace, as shown in the cut. Its chief fault lay in the fact that but one scorifier or cupel could be operated at a time. This furnace had almost entirely escaped attention as an assay furnace, owing to its having been advertised mainly for melting small quantities of lead, copper, brass, etc. In fact, it had been withdrawn from the market when I took hold of it, with the idea of improving it so that it should be able to treat three or four or more scorifiers or cupels at once. With this object, the present furnace was finally constructed.

To manage it, remove the covering bricks, open the damper and shut those of the other furnaces, turn back the milled handle at the gas entrance to the burner, so as to allow a full flow of gas, turn gas on full at tap, light, and put back the bricks into place. In from 12 to 20 minutes the interior will be hot enough for work. The bricks are then removed again, the charged scorifiers are placed on the false floor, the bricks are replaced, and the excess of gas is turned off at the burner. When the charges have melted, slide the bricks aside more or less—principally those nearest the burner—to admit air for oxidation. In cupellation, the gas is turned down more than in scorification.

The time of performing either scorification or cupellation varies according to the nature of the ore, charge, size of button, etc., but is about the same as that occupied in the use of a coke-furnace.

The consumption of gas is not far from 30 cubic feet per hour. It is not intended or claimed that this furnace can take the place of one required to be run from ten to twelve hours per day; for that, of course, a solid fuel will be cheaper. But for short runs of from one to say four hours it is economical, as are also the others here described.

For small laboratories, therefore, the advantages of this furnace are many: convenience of operating, since the assayer sees every step and stage of the operation, and so can tell when and where to change or improve; comfort in manipulation, since it does not heat up the vicinity of the furnace and the room itself (quite a desideratum in the summer time); perfect control of the source of heat, so that a higher or lower temperature, a reducing or oxidizing effect may be produced in an instant; entire noiselessness (in which characteristic it is the superior of all blast assay-furnaces); saving of the time which, with furnaces employing coke, charcoal or coal, is spent in "bedding down," feeding, etc.; freedom from the annoyances of dust, ashes and smoke; and absence of waste. Finally, it possesses the advantages, which need not be dwelt upon, of simplicity of construction, durability and portability. Such simple tools as are required can easily be made from quarter-inch wire. The complete plant, as illustrated, costs about $75. The furnaces are manufactured by the Buffalo Dental Manufacturing Company, of Buffalo, New York.

It is currently reported at Bisbee that the Copper Queen company have paid to the owners of the Atlanta mine the sum of $40,000, in settlement of the former company taking ore out of Atlanta ground.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

A Reminiscence of a Great Inventor.

History of the Sewing Machine Needle.

EDITORS PRESS:—To the best of my recollection it was in the spring of 1848 that I was in the sittiug-room of the depot at Canton, Mass., waiting for a train. There were not many people there—a few were moving round, while some, like myself, were seated. The lower back corner (that is on the down or Boston side) was occupied hy a mixed company of what appeared to be relatives and friends; the frout lower corner I occupied, the upper back corner was occupied hy one I took to he a minister, long-faced, thin in the cheeks, with high cheek hones. A wood-cut I saw lately in a magazine or paper of Bishop Porter, made me think he was the individual. The person occupying the upper front corner had a Vicar of Wakefield air about him that rather pleased me, hut his Byron collar told me at once he was not a minister. He had something heside him tied in a large silk handkerchief, that I took to he a bird-cage or a squirrel-house, or sometbing of that kind. My first impression was that he was a bird-fancier or rat-catcher. He was rather stout, with broad hut regular features and good color. His mouth was wide and his lips full, and taken in connection with the repose of his eyes, made me think that he had imagination and application in a high degree. My idle fancy soon began to surround him with pleasant associations, and I concluded he was a well-to-do farmer or dairyman. He gave a quick look at every one, I should say, in the room, then he rose and advancing to the door said: "I have somethiug here I will show you. It is a sewing machine, and I am going to Washington to get a patent." We all got up aud followed him. He untied the handkerchief and stood the machine on the platform.

It was something less than a foot square, having a frame of hard wood, with two spools of thread, one on the top of each of the front corners. The machine was put in operation—the minister expanded and expatiated. I was young and a foreigner, and rather diffident. I felt much interested, but did not like to intrude. Howe, with true politeness, opened the way for me to step forward. He evidently expected me to say something. I complimented him on his ingenuity and scope of his invention, and asked him if he had ever seen a Lappit loom. He answered that he had not, but evidently concluding that it had some connection with a sewing machine, he appeared interested. I explained to him that Lappit cloth was a thin white muslin, used for window curtains, with small, detached flowers, made with coarse, soft yarn, and which were worked in hy needles, with an eye on the end. The cloth had a wrong and a right side, like cassimere, but the connection thread on the wrong side was trimmed off. By taking hold of the end of the thread and pulling, the flower would come out. When I was little I called this magic, but my exhibitions were unprofitable and got me into serious trouble. I explained to him that a Lappit needle working in a direct line on two pieces of cloth was a sewing machine. He asked me where he could see a Lappit loom, I directed him to Reed's Factory, Washington Street, Glasgow, Scotland. He noticed in a pleasant way the American name to the street. I replied that the street was called after George Washington and that I helieved Mr. Reed was an American. At first he was interested, he now appeared a little excited. He took me warmly by the hand, and I must say I liked the pressure of his big warm hand. We parted with promises, which I am sure he would have filled had I corresponded. If my suggestion was any benefit to him he was very welcome. Independent of his inventive genius I liked the man. M.

Sweetwater Mines.

EDITORS PRESS:—The Kentuck mine has levied an assessment of 5 cents per share. The late storm has retarded mining operations to a considerable extent. It has been snowing and blowing for seven days.

The Star lode had several tons of ore worked at the old mill, which pulped $75 to $83 per ton, the front lode being the best. They will work all winter.

Several mines had ore worked at the new mill, to wit: the Home Stake, 3 tons pulped $266; 10 tons of Poverty, $43; 10 tons Lady Hayes, $33; Silverado, 50 to 60 tons, result unknown.

The new Look-out Company have located a mill-site, with water-power, on Sweetwater creek, below Messamar's tunnel, and intend to build a 15-stamp mill in the early spring. Work is prosecuted in the mine constantly, and a large house is erected at the mouth of a new tunnel just started.

The Kentuck Mining Company have in their office large specimens of sulphuret ore, recently taken from the winze below the 500-foot level. It is nearly half black sulphuret of silver.

Sweetwater, December 29th. R. T. S.

FOR the forty-fifth time in his life, Dr. Palisa, of Vienna, has discovered a small planet, increasing to 243 the total number of tiny worlds known to belong to our solar system.

The Cœur d'Alene.

Hearing that Mr. C. D. Porter, the noted mining expert, was in town direct from the Cœur d'Alene country, a Salt Lake *Tribune* reporter went in quest of him. Mr. Porter was decidedly averse to being interviewed, hut said that he would most willingly give the *Tribune* any information he could about the country, and the following interesting facts were elicited: The outlook on Pritchard creek and vicinity is hetter than the most confident friends of the country would have ventured to hope a few months ago, and there are about 2,500 people now on the ground who are doing well, and up to the time that winter set in, and the output from the diggings was steadily increasing in value. The gold is very coarse, and runs about $17 to the ounce. Some nuggets have been found worth $400. The town of Murray is 33 miles from Thompson's Falls, the nearest station on the Northern Pacific, and a sled-service has been established to run this winter between those two points. The country is low and warm ou Pritchard creek, so that there are sure to be thaws during the winter which will enable the miners to carry on considerable sluicing, but work will not proceed at full blast till next spring.

On top of the mountains above Pritchard creek there is an ancient river bed, called by miners the "Old Wash," in which two men with a common rocker have taken out as much as a pound of gold in one day, and it is anticipated that the real bonanza of the region will be found in the "Old Wash" as soon as a proper supply of water can be brought there. Work looking to this result has already been commenced, and a ditch, now well advanced, will cover one of the richest parts that has been prospected. Very little can be done in the way of mining until spring.

John Burke, formerly of Salt Lake, has completed a ditch to some valuable ground owned by himself and others, and will commence sluicing early in the spring. Richard Cummings, with about 15 inches of water, has been working on the "Old Wash" near Murray, and has taken out at least one ounce per day to the man on an average. In Pritchard Creek the developments have been very satisfactory to the owners, and all claims from Oshorne to Butte that have been developed have given such good results that the lucky proprietors are perfectly satisfied to stay with their prospects.

The prospect for quartz mining is also brightening up. Golden Chest mine in Reeder Gulch, has been sold to a company from Louisville, Ky., which, it is understood, will put up a fine mill and other improvements next season. The famous Mother Lode, the Occident Lode, and two or three other quartz claims, also 40 acres of placer ground on Pritchard Creek, have been sold to English and Colorado capitalists who intend to press forward the work of development with energy, in the spring.

On Trail Gulch, four miles from Murray—a tributary of Beaver Creek—the developments have been far beyond the most sanguine expectations, the Mahoney claim, Van Dorn har, and many others, the names of which Mr. Porter could not recall, are found to be marvellously rich, while Potosi Gulch and two or three other tributaries of Beaver are no less promising, and Eagle Creek, near the head of the stream, had become a steady producer before the winter set in. On upper Beaver Creek, some good lead and silver ores have been found, and on Canyon Creek, 10 miles from Murray, John Burke and others are working upon a prospect which must become, unless indications are very deceptive, a great mining property in the near future. Four miles south of Canyon creek, on the south fork of the Cœur d'Alene river, at a place called "Nigger Prairie," some very rich silver ore has recently been found. "In fact," said Mr. Porter, "the future of the great northwest looks brighter than any part of the country I know of. New camps have recently been established at a point fifty miles north of Spokane Falls, near a place called Chewelah, and one on the Pen d'Oreille river, about thirty miles from Calispeel station, on the Northern Pacific railway. The coming season will convince people of the merits of the region, and throw into the shade some of the best mining sections ever discovered in this country."

MINING IN DEL NORTE COUNTY.—The Del Norte *Record* says: Mining, which has been going on in different parts of the county ever since its settlement, is now mostly confined to the hydraulic system. About thirty miles from Crescent City is the mine known as the Big Flat gravel mine, owned hy a joint stock company, O. M. Paris being one of the principal owners. About $200,000 was expended in bringing water and other appliances to this mine by a Boston company before any gold was taken out, and before the property fell into the hands of the present owners, but now it is paying a handsome dividend. Other mines of a lesser magnitude are on this side of the mountains, but a greater part of the paying mines in the county are situated on the Klamath river and Indian creek, in the vicinity of the town of Happy Camp. Of those that are most noteworthy are the Bunker Hill claim, owned by Temple & Childs; Wingate Hill, also owned hy Mr. Temple; the Grider claim, Camp & Co. owners; the Happy Camp claim, formerly owned by H. Gasquet, but lately purchased by W. I. Smart, an Eastern man; the Del Norte, owned hy S. S. Richardson, and the Muc-a-muc, hy A. Doolittle, and the China creek claim, Jas. Reeves owner. All of these mines are hydraulic, and during the rainy season, and until late in the spring, they are worked with varied success, but always paying well. In the immediate vicinity of Crescent City there are no mines now in operation, though a few years ago heach or black-sand mines were extensively worked just helow town with good success, a large amount of gold having been taken out, hut of late years, for some cause, the mines have laid idle.

Assay of Tin.

Cassiterite is a tin-oxide of tin. It is found in nature hoth crystalline and amorphous. In its former state it occurs in veins, intersecting granite, gneiss, mica-schist, porphyry, and other rocks. In its latter condition it is found in rounded uodules or grains, from several pounds in weight to the finest black or hrown sand. This is called stream tin, hecause it is found in placers like gold, in the heds of streams, into which it has heen washed hy the action of water, resulting, like placer gold, from the disintegration of rocks which contained it in veins, its great specific gravity (6.4 to 7.1) causing it to resist the force of the water which has washed away lighter minerals. Stream tin is found of various colors and texture, being black, brown, drab, or nearly white; perfectly compact and amorphous, laminated, mamillary, or hotryoidal, with elevated points (toad's eye tin), fihrous (wood tin), concentric, radiated, etc. H. 6—7; luster, adamantine when crystallized, stream tin dull, nearly transparent to opaque. Tin is also found in nature as a sulphide, hut is comparatively rare. It has been found also in meteoric stones.

The State mineralogist in his report gives the following method of making a test:

Cassiterite is easily reduced to the metallic state in a crucihle with carhonate of soda and anthracite coal dust (culm), or cyanide of potassium. The crucible should be allowed to cool, and then be hroken to remove the button of tin; for this operation a hot fire is required. B. B. on ch. easily reduced if the following plan is adopted: The ore supposed to contain tin should be pulverized and passed through a 40 to 60 mesh sieve, the resulting powder washed in a pan of horn spoon to a small quantity, the *prospect* dried and ground in an agate mortar with twice its bnlk of carhonate of soda. This mixture is transferred to a cavity in a piece of charcoal, and heated in the R. F. until the assay assumes a spherical form, more is added until a glohule is obtained half the size of a pea; a small piece of cyanide of potassium of ahout equal size is then placed with it, and hoth strongly heated in the R. F.; globules of tin will immediately appear if the metal was present in the ore, which hy a little skillful manipulation may he made to coalesce into one, or the assay may be cut out of the charcoal with a knife, and ground with water in an agate mortar, when the heads will flatten into small discs under the pestle, and may be separated by washing. To be sure that the metal is really tin, the following experiment may be made: Place the head on clean charcoal without fluxes, and heat first in the reducing and then in the oxidizing flame. If tin, it will lose its metallic character and become a white oxide, which it will he found very difficult to reduce again to a metallic glohule. This may he effected by the addition of a small piece of cyanide of potassium. Observe that no distinct coating is formed on the charcoal, which would be the case if the metal were lead, remove the bead to a small anvil and strike it with a bammer until flattened out (antimony and hismuth are brittle).

The hutton hoiled in a test tube with nitric acid does not dissolve, bnt is changed into a white insoluhle powder. Antimony gives a similar reaction, but is brittle, and on charcoal would have hurned, and given off thick white fumes of oxide of antimony. These tests will serve to distinguish tin from other metals which it resemhles, hut another still more characteristic test may he made as follows: Reduce a bead of tin from the ore hy the method above described, hammer it out very thin, place it in a clean test-tuhe and pour hydrochloric acid over it; action takes place, and the metal dissolves. Before solution is complete (a portion of the metal remaining undissolved) pour a few drops of the solution into a vessel contaiuing a dilute solution of terchloride of gold, a purple color will he produced, which leaves no doubt that the metal is really tin. These tests are described with considerable attention to detail, hecause tin is liahle to be found in quantity in California, and it is desirable to furnish the prospector with information by which he can test the ores he may find, supposed to contain tin. It is very important to concentrate a considerahle quantity of the ore, as described, for experience has shown that tin may exist in small quantities in minerals and ores, uot indicated hy the appearance. Great care should he observed in the use of cyanide of potassium, which is a *deadly poison*.

AMERICA now leads the world in the quautity as well as the quality of copper produced, and its manufacture into hrass and other forms of finished metal is one of the leading industries of the country.

Alaska Mines.

Governor John H. Kinkead, in his report on Alaska to the President, says:

In the vicinity of Sitka, and in the region of Prince William Sound and Cook's Inlet, as well as in many other places—in the Chilcat River country, for instance—the promises for the future are good. The geological formation and general characteristics of most of the islands in the archipelago and the contiguous mainland are apparently the same.

I confidently expect that within the next decade the production of precious metals in the district will he an important factor in the finances of the general Government.

The presence of ores in the district is not a new discovery. The fact of their existence has long heen known, but the industry has languished and been almost ahandoned, for the reason that the only title to the property of the miner recognized was that of force; not always, hut still frequently enough used to discourage and measurably prevent exploration. This evil will he remedied hy the introduction of civil law.

The difficulties attending the successful prosecution of this industry are great. High and precipitous mountains, densely covered with timber and chapparal, fallen and decaying trees; the earth covered with moss and vegetation to the depth of one or two feet, seem almost to forhid the progress of the prospector.

To compensate for this, however, there is unlimited water power and an abundance of fuel existing almost everywhere, and within easy access from the mining districts hy any class of ocean steamers. The difficulties will be overcome, and the natural advantages utilized slowly, yet surely. The adverse conditions, indeed, do not exist even now throughout the entire country. Westward from ahout longitude 140, and north of latitude 60, the timber belt ceases abruptly, and on the Alutian Islands and the shores of the mainland, the country is open and free from the foregoing noted difficulties. The great interior, also, though having plenty of timber for practicahle purposes, is generally well apapted to mining and successful exploration. With the development of the mining interests, population will iucrease, and other industries progress as a natural consequencc.

Coal, copper and other minerals are known to exist in many localities in the district. To what extent they have been developed, I am not yet informed, although I learn that explorations in this direction are being actively and energetically pursued.

AUSTRALIAN MINES.—A Russian miuing engineer, now in this city, who has recently come from Australia, having spent some months in New Zealand, New South Wales and Victoria, says: I do not think mining there is so active and paying as in former years, having been greatly superseded hy the wool interest. Most of the activity and progress made is due chiefly to the liherality of the Government in building railroads, water races, supplying diamond drills for prospecting and helping along mining in every other possihle way. I first visited New Zealand. There placer mining is principally carried on, the quartz mining heing confined to the other places. A great amount of capital has been introduced in this country. Gold quartz mining does not appear to be very profitahle, and very little is done with silver. They have immense hodies of rich copper ore, but its present low price makes its workings very unprofitable. The geological formation of the ores I found to he the same as those of Siberia. In Ballarat, the chief district for deep alluvial mining, the ores, as a rule, are not very rich, although they exist in large bodies. The biggest mill I found had 25 stamps, and there are 50 or more of this size. The deepest mine is down 2,400 feet, and is in the Clune district, near Ballarat. The ore was at first quite rich, but is now very low. They are still sinking, in the hope of striking it rich again. The deepest placer shaft is 600 feet deep. Generally the veins are found to he very irregular, but in the Sandhurst district there are 12 parallel veins, from 3 to 50 feet wide, which have already been prospected a distance of 6 miles. A general freedom is accorded in locating claims, and from 1 to 30 acres may he staked for placer mining. In locating lodes, they must not be less than 100 nor more than 600 feet in length, and from 50 to 200 feet is allowed in width. They have the hest kind of machinery of all kinds, of American inventiou. They have manufactories of their own, hut work after American models. I do not consider them as well made as the engines, etc., turned out here, and, as I have already stated, I shall prefer to buy in California.

THE Silver Odessa mine, in East Calico, is looking exceedingly well, especially for a mine that was supposed hy those familiar with the "tactics" of miniug operations to be "played out." A tunnel several hundred feet in length has been driven through the hill, which follows the meanderings of the principal ore vein. At brief intervals in the tunnel can he seen small seams of very rich ore, which widen every few feet into pockets of hlack metal, chloride and horn silver. At numerous points prospect drifts have heen made, all of which penetrate ore. The ore hody extending through the hill is 40 feet wide.

MECHANICAL PROGRESS.

Improved Workmanship.

Said an old and long experienced machinist ths other day, one of a firm of well-known manufacturers: "I should be ashamed now to father soms of the nice jobs I prided myself upon 30 years ago. I was a first-class machinist, and got firs -class pay; but I have msn in my shop, not yet out of their four years' apprenticeship, who can do a better job than I could thon. And it is not all owing to improved machine tools; it is because better work is exacted, and better instruction is given to apprentices."

The reduplication of parts and of entire machines in modern practice is one reason for this improvement in individual skill. In addition to the necessary hand-work in making templates, jigs, gauges nnd other appliances for reduplicatioo, there is much more exactness in fitting than formerly, requiring individual judgment, patience of work and skill of hand. The modes of doiug work hnve been greatly changed; patterns for the moulder ars made to such modifications of the old-fashioned rule of "one eighth of an inch to the foot for sbrinkags" as would astonish a Rip Van Winkle of a machinist or pattern maker. Some patterns require very intricate calculations and very exact proportions before they finally leavo the patteru shop for the fonudry. Castings uow come from the pickling room, requiring only n superficial dressing to fit.

So, ths forger must work to the line. Thirty years ago, if tho forger's product rssembled the object intended as closely as Hamlet's cloud did a whale or a camel, it was as near as could be expected; but now there are jobs coming from the forging shop that it seems a shame to submit to ths tearing planer and the rasping milling machins. Thirty ysars ago a machine tool new from the shop was expected gradually to work itself into usable shape; the carriage and foot stock of a lathe wsre to gradually adapt themselves to ths ways of the lathe, and the cross-head of the new planer had to be gibbed up again and again, and perhaps ground with flour of emery and oil, before it fitted the uprights; and it was a common practice to run the platen of the new planer back and forth, for a day or so, with the Vs loaded with emery and oil.

To-day the new tool works as perfectly when first started as when months old; a result to be attributed more to the patience and skill of the workman than to the improvsments in the tools he uses; the scraping to fit of the modern machine shops demands as much judgment and hand skill as it does of patience.—*Scientific American.*

How to Succeed as a Mechanic.

Many of our readers know the reputation of the Maydole hammers, hut few of them, perhaps, are acquainted with the history of the man whose nams has become associated with his goods, and which is a guarantee in itself of the very best quality. In an address before one of ths husincss collsges in Washington City, the late President Garfield rslatcd a story, illnstrating the success that is sure to follow persistent effort in a worthy cause, when exerted in the proper direction. Hs gave an outline of the life of Mr. Maydole, which will bear repeating. "Thirty years ago a boy was struggling through the snows of Cbenango valley, trying to hire himsslf out to a blacksmith. He succesded, and learned his trade: but he did more. He took it into his head that he could maks a better hammer than any other man had made. He devoted himself to the task for more than a quarter of a century. He studied the chemistry of metals, the strength of matsrials, the philosophy of form. He studied failures. Each broken hanmer taught him a lesson. There was no part of the process that hs did not master. He taxed his wit to invent machines to perfect and cheapen his processes. No improvement in working steel or iron escaped his notice. What may not 25 years of effort accomplish, when concentrated on a singls ohject! He earned suecess; and now, when his name is stamped on a stesl hammer, it is his note, his bond, his integrity embodied in steel. Ths spirit of the man is in each hammer, and the work, like the workman, is unrivaled. Mr. Maydole is now acknowledged to have made the hest bammer in the world. Even the sons of Thor, across the sea, admit it. While I was there, looking through his shop, with all its admirahle arrangements of tools and machinery, there came to him a large order from China. The merchants of the Celestial Kingdom had sent down to the little town to get the best that Anglo-Saxon skill had accomplished in the hammer business. It is no small achievement to do one thing hetter than any other man in the world has done it."

TO CENTER AN ENGINE.—Move the engine hy the fly-wheel toward the end on which you wish to center it, till the cross-head is near the end of its travel, and mark the slide even with the end of the cross-head, and then with the surface gauge, or any fixed point, make a mark on the fly-wheel rim, crank disc, shaft or any finished revolving part, pry the engine past the center and till the cross-head passes the mark on the slide; then pry hack again till the cross-head agrees exactly with the mark on the slide. This last, in order to have all lost motion in connecting rod taken in same direction both times. With engins in present position make another mark on the revolving part first selected. With a pair of dividers bisect the distance between these marks nnd pricepunch the spot. Pry the engine around until this point coincides with ths points of your surface gauge, and the crauk is absolutely on the dead center, if the axis of the piston rod and axis of shaft are in tho samo plane, as they should bo.—"*Amos K.*," *in Steam.*

TEMPERING THIN MILLS.—It is a somewhat risky job to hardeu and temper, without springing, thin lathe saws, or milling tools, made from sheet steel. When sprung, they *may* be straightened, if not too much out, by hammering; but not one machinist in teu knows just how to it, and no verhal instruction can teach the trick. But a good workman, who is not afraid to tell his secrets, says that he nevor fails. His plan is to have two disks of cast iron, preferably of a size small snough to allow the teeth of the saw to project beyond their rims. The inner face of these he scores (in the pattern, of course) into radial and annular scores, so that the engaging faess will present only minute points. These castings are chucked and faced so as to be true, and the saw placed between them and held by n nut and bolt passing through a central hole. Plates and saw are heated together and chilled togethsr in the oil, which, by means of the scorcs, is allowed to reach nearly the entire surface of the saw. Thero is no springing of the saw under this treatment.—*Scientific American.*

FASTENING A BELT.—A correspondent of the *Woodworker* says about fastening a bslt: After quite a good experience with a great many ways of joining, I must say that above all others I prefer lapping and riveting, and I will give my reasons therefor. First, and above all other things, a riveted joint is the cbeapest. I don't mean cemented and riveted, but lapped and riveted, taking care to skive nicely, so that the joint will not bs clumsy, making the scarf according to the size of the belt. Do not scarf the ends down too thin; if you do the rivets will be likely to tear out. A little practice in this style of fastening a belt will make you do a nice job, and if you once get used to it I will warrant that you will never use any other method. It takes no more time, if as much, as it does to either lace or hook a belt with any device I have evsr seen, and I have seen a great many. This style of fastening should be used all over the mill, whether driving belts or not.

A STEEL SUBSTITUTE FOR WOOD SLEEPERS. The Barrow Hematite Steel Company, says tbe *Ironmonger*, ars expsrimenting, with the view of manufacturing steel railway sleepers as a suhstitute for, and at about the same cost as, wood sleepers. A similar experiment has been tried at the works of the London and Northwestern Railway at Crswe, but has not succeded, inasmuch as, by the use of rail ends and other scrap, the cost of ths steel sleepers has always heen a few shillings mors than those made of timber. The Barrow Company have received an order from ths Northeastern Railway Company for a number of steel sleepers, and by the judicious application of tbe best machinery it is helieved that ths attempt to make steel sleepers at the sams cost as wood will be successful.

ITALIAN MECHANICAL INDUSTRY.—The Italiau Admiralty is about to make an attempt to emancipate Italy from foreign machine builders, not only as regards the manufacturing, but the designing of steam engines. Hitherto Italian establishments and work-shops have simply copied foreign desigus. To attain ths object now aimed at, the seven principal mechanical firms of Italy have been invited to send in complete designs for 6,000 horse-power engines for a transport now in course of construction, and the invitation has heen accepted.

MOLDING SAND.—A large proportion of the molding sand consumed in the foundries of the United States is dug out of the hills of Albany county, N. Y. It is said that everything in fusible metal, from a Krupp gun tb a heel plate for a lady's shoe, has heen cast in Albany sand. Quantities of it have been exported as hallast. The annual shipment of sand (obtained thereabouts) from Albauy is estimated at 75,000 to 100,000 tons, the price paid for it, delivered on hoard the cars or boats, being about $1.25 per ton.

THE SOUTHERN IRON INDUSTRY.—It is a curious fact that while the iron mills in the North are nearly all idle, or running half time, in consequence of the stagnation in trade, the most prosperous industry in the South to-day is the iron manufacturing husiness. There has not heen a single furnace closed tbis year, and an extraordinary fact in connection with it is that the iron furnaces are said to he nearly all running ou orders received from north of the Ohio river.—*Boston Commercial Bulletin.*

SAW TEMPERING BY NATURAL GAS HEAT.—Messrs. Emerson, Smith & Co., Limited, of Beaver Falls, Pa., are, we helieve, the first to use natural gas in heating furnaces for hardening and tempering saws. It is claimed that, natural gas being composed so largely of "hydrogen" and entirely free from sulphur or other base substances, and giving a steady, regular heat, steel is strouger and rendered less hrittle and less liable to crumble than when hcated hy coal or coal gas.

SCIENTIFIC PROGRESS.

The Velocity of the Moon.

We can faintly picture, says Profsssor Langley, how it would seem if we were placed at a station in space near ths lunar orbit and could see ths moon, a moviug world, rush by us with a velocity greater than that of a cannon ball in its swiftest flight. This fesling may be almost realized, in fact, by witnessing from some high mountain the shadow of the meon as it passes swiftly by during an eclipse. On such an occasion its shadow actually travels along ths earth with the same speed of its flight in space. The obssrver upon some lofty point from which his vision reaches many miles to the west can easily discern and follow the approaching shadow, and witness the actual velocity of a heavsnly body, as it were, brought down to him. Such a sight was once witnessed and described by some one in this State (Prof. Davidson, we think) from an elevated point on the Sierras.

Professor Langley gives the following other instances: The reader who has ever asconded to the Superga, at Turin, will recall the magnificent view, and be able to undorstand the good fortune of an observer (Forbes) who once had the opportunity to witness thence this phenomenon, and under an nearly cloudless sky. "I perceived," he says, "in the southwest a black shadow like that of a storm about to break, which obscured the Alps. It was the lunar shadow coming toward us." And he speaks of the "stupefaction"—it is his word caused by the spectacle. "I confess," he continues, "it was the most terrifying sight I evor saw. As always happens in cases of suddsn, silent, unsxpected movements, ths spectator confounds the real and relative motion. I felt almost giddy for a momcnt, as though the massivs building under me bowed on the side of the coming eclipse." Another witness, who had been looking at some hright clouds just before, says: "The brigbt cloud I saw distinctly put out like a candle. The rapidity of the shadow, and ths intensity produced a feeling that something material was sweeping over the earth at a speed perfectly frightful. I involuntarily listened for the rushing noise of a mighty wind."

Pyronaphtha — A New Illuminating Material.

According to reports of recent Russian periodicals and scientists, the carth oils of Baku bid fair to introducs to the world som thing quite new in the way of an illuminatiug material—a material with illuminating fully equal to kerosene, but without its dangers. A recent St. Petersburg paper says: An interesting trial was lately made in St. Pstersburg with a new illuminating material which is destined, it is considered, to take the place of kerosene. This is an illuminating oil, said to be absolutely fres from danger of fire. An expsriment was mads as to the power which pyronaphtha has of extinguishing fire, and it was found that burning kerosene was easily put out by it. Pyronaphtha can itself hs extinguished hy water. It is a product of the distillation of napbtha residus, of which large quantities remain from the Baku distillation of petroleum. From these illuminating gas is produced, and likewise pyrenaphtha. The idea would seem to have hitherto been carried out only by Ragosin & Co., of Baku. A celebrated Russian chemist, Professor Beilstsin, has examined pyronaphtha, and has expressed his conviction that it has a brilliant future hefore it, and that it must eventually replace American and Russian kerosene. The specific gravity of pyronaphtha is .864, and it ignites only at 230° F. It burns without smoke and vapor at 259°, gives a hrighter light than kerosene, and is consumed less rapidly, while its prime cost is less. At St. Pstersburg it is heing adapted for domestic use, and Messrs. Romberg have constructed a special burner for that purpose.

A BALLOON BATTERY.—There is an arrangement of Daniell's battery, called "balloon batteries," which has been and is still used in some countries. It needs no attention for six months or more at a time. The cell is surmounted with a flask, open at the bottom, which contains two pounds of sulphate of copper crystals, and is filled with water. The flask is closed with a perforated cork, fitted with a glass tube. This tube descends as far as the liquid in the porous jar. The solution of sulphate of copper heing more dense in proportion as it is more concentrated, it can be seen that the part of this solution which is in the porous jar is constantly held at saturation, for as it weakens it is supplied by the saturated solution which descends from tbe flask. The glass jar of the cell is closed with a wooden lid, which supports the flask. The result is, the evaporation is reduced to almost nothing, and consequently there is a very slight or no formation at all of climhing salts, and the liquid is preserved. This battery has been known to work for more than a year without requiring any attention, during which time it has satisfactorily met all practical requiremen's.

A SPLENDID AEROLITE SECURED.—An aerolite fell on the farm of C. Francois, at Chateau Richer, a short distance from Quchec, at 3 A. M., on Saturday, December 13, 1884. It was dug from the ground, in which it had smbeddsd itself, and was found to measure about a foot in diameter. The people were so startled hy the intcuse light that many rushed out of thsir houses to ascertain its causs. They say that the falling meteor presented the appearancs of a huge ball of firo, which lightsd up the whole country side almost with the brilliancy of the noonday sun.

SHORT-SIGHTEDNESS.—A writer in the Loudon *Times* claims that short-sightedness is csused by the too constant application of the eyes to near objects—such as poring over books and too constant application to small, fine handicrafts. When the eyes are directed to a near object, they are turned in or rendered convsrgent, in order that the axis of visiou may meet upon it, and this position is maintained by a muscular effort, which, if continued, alters the shape of ths eye in ths direction of elongatiou. Manifsstly ths elongation will bs most sadly effected during the youth, when the tissues of tbe hody, including those of the eye, are comparatively lax and distensible, and it will also be most easily affected among thoss young people whose tissues ars sxceptionally weak by reason of inadeqnats food or unhealthy descsnt or surroundings. Badly lighted school-rooms are the greatest manufactoriss of short-sightedness, tbs bad light compelling approximation of the books or other matsrials of study.

DISCOVERY OF THE CIRCULATION OF THE BLOOD.—The history of the discovery of the circulation, recapitulated, divides itself naturally into a series of epoch-making periods: 1. The structure and functions of the valves of the heart, Erasistratus, B.C. 304. 2. The arteries carry blood during lifs, not air, Galsn, A.D. 165. 3. The pulmonary circulation, Servetus, 1553. 4. The systemic circulation, Cæsalpinus, 1593. 5. The pulmonic and systematic circulations, Harvey, 1628. 6. The capillaries, Malpighi, 1661.—*Dr. Henry C. Chapman.*

HEAT CONDUCTIVITY OF SOILS.—The author's conclusions are that ths hsat conductivity of a soil is so much the greater, ths more densely its particles are packed togsther. The difference thus occasioned is the more considerable, the higher ths proportion of water. In a dry soil the heat conduction rises witb an increase in the size of the particles of ths soil. Watsr increases the conductivity of the soil considsrably, the more, the larger its proportion in the soil, the circumstances being equal.—*Dr. F. Wagner.*

BIOLOGICAL STUDENTS AT CAMBRIDGE UNIVERSITY increase in number so rapidly, owing to ths great facilities afforded of late years, that it is almost impossible to keep pace with the demand for larger work-rooms and lecture-rooms. No lecture-room in the University is largs enough to accommodate the class in slementary biology under Messrs. Sedgwick and Vines' instruction during the present term.

DR. KOCH'S CHOLERA MICROBES.—Dr. Klein, appointed by the government of India to investigate the cholera question, has satisfied himsslf that the minute organism or "microbes" discovered by Dr. Koch are not the cause of cholera. He has shown the strength of his conviction by swallowing some of the microhes, and no evil result followed.

DISTRIBUTION OF THE MINNOW.—In Switzerland the minnow reaches an altitude of about 7,900 fset above the sea lcvel, according to Mons V. Fatio, and the miller's thumb one of 7,200 feet. The perch stop at 6,500 fest, and no others pass above 2,600 feet, although the carp, tench, rudd and chub have been successfully introduced at 3,500 to 5,600 feet.

SAFFRONS, from the south of France, are said to contain a very small quantity of alumina, not by way of an adulterant, but naturally. Ths alumina is present only in the proportion of 0.115 to 0.123 per cent. Certain lycopods and *Rohus arcticus* are the only plants in which alumina has hitherto been discoversd.

EFFECTS OF SUN-SPOTS.—In 1859 a magnetic storm of unprecedented magnitude continued from August 28th to September 7th. Prof. Balfour Stewart has pointed out that this was synonymous with the period of maximum activity of one of the largest sun-spots ever observed.

THE SAN DIEGO SOCIETY of natural history has received an addition to its herbarium of 700 species of southern and lower Californian plants. This series of plants will be known as the Orcutt herharium.

PIANOS are played and corn popped hy electricity at the American Electrical Exhihition in Boston. Pretty soon hashful men can pop the question by electricity.

A SHAVING from a deer's hoof, with a powerful microscope and polarised light, is as wonderful a thing to hehold as is the rainhow.

LINES have been ruled upon plates as fine as one million to the inch. Of course they can ho discerned only with a powerful microscope.

ONLY TWO.—There are hut two living species of elephants, the Afriean and the Asiatic.

SAN FRANCISCO:

Saturday Morning, Jan 10, 1885.

TABLE OF CONTENTS.

EDITORIALS.—A Gas Assaying Plant, 17. Passing Events; Salt in Nevada; Mexican Smelting and Refining; Gypsum, 20. A Notable California Invention; Regenerative Methods for Copper; Foundry Notes, 21. Giant Powder, 28.

ILLUSTRATIONS.—A Gas Assaying Plant, 17. N. W. Spaulding's Improved Insertible Saw Tooth, 21.

CORRESPONDENCE.—A Reminiscence of a Great Inventor; Sweetwater Mines, 18.

MECHANICAL PROGRESS.—Improved Workmanship; How to Succeed as a Mechanic; To Center an Engine; Tempering Thin Mills; Fastening a Belt; A Steel Substitute for Wood Sleepers; Italian Mechanical Industry; Molding Sand; The Southern Iron Industry; Saw Tempering by Natural Gas Heat, 19.

SCIENTIFIC PROGRESS.—The Velocity of the Moon; Pyronaphtha—A New Illuminating Material; A Balloon Battery; A Splendid Aerolite Secured; Shortsightedness; Discovery of the Circulation of the Blood; Heat Conductivity of Soils; Dr. Koch's Cholera Microbes; Distribution of the Minnow; Effects of Sun Spots, 19.

USEFUL INFORMATION.—Pine Wood Shavings; An Easy Test for Lubricants; Fruit Stains; Basket-Making in Germany; Tracing Paper; Cement for Patches on Shoes; Lead Coated Iron Nails; To Soften Rubber Rings; Extending Our Manufactures, 23.

GOOD HEALTH.—Waking One's Self at Will; Heart Beats; Fancying Himself an Invalid; A Hundred Years of Life; The Model Healthy Man, 23.

MISCELLANEOUS.—The Coeur d'Alene; Assay of Tin; Alaska Mines, 18. A Master Mechanic on Industrial Education; Who Made the First Flannel; Mining; Missing the Paper, 22. Technical Education in England, 23.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 24-5.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 28.

Bnsiness Announcements.

Quartz Mills—F. A. Huntington, S. F.
Giant Powder—Bandmann, Nielsen & Co., S. F.
Saws—N. W. Spaulding Saw Co., S. F.

☞ See Advertising Columns.

Passing Events.

The most notable item of the week in mining matters is that relating to the probable closing down of the copper smelters at Butte and Anaconda, Montana, owing to the low price of copper. The metal is now 9½ cents in New York, and the Montana smelting men say it costs 9 cents a pound to lay it down in that market. High rates of freight must come down, they say, or they will have to stop the smelters in Montana.

The full figures of the gold yield of this State are not yet to hand, but those so far gathered show a large falling off on the product for 1884.

The Legislature convened at Sacramento this week, but so far little business outside of organizing has been done.

Some of the lead smelters of Utah are talking of shutting down unless the price of lead improves shortly.

A great many mines were re-located throughout the coast on the 1st instant, former owners not having done the assessment work required by the laws. Very few cases of conflict are reported.

ANNUAL MINING REVIEW.—Our review of the mining industry for 1884, will be published in the PRESS of the 24th inst. We hope our friends in the smaller and less prominent camps will send us in some notes for publication in that number. We shall be glad to receive accounts of mine and mill work generally. Even rough notes will be acceptable, and we will arrange as required. Such letters should be received here by the 19th inst. at latest, to be inserted. We hope our friends will respond to this request.

Salt in Nevada.

The largest deposits of salt on the Pacific Coast are found in Nevada, where they occur under various conditions. The most extensive and remarkable of these deposits is that on the Rio Virgen, a few miles north of the Colorado river, in the extreme southwestern corner of the State. A formation exists at this point composed of rock salt, resting on, and to some extent intermixed with, a sedimentary granite, and of such magnitude that it may be said to constitute a notable portion of the mountain in which it occurs. More than 60 per cent of the entire mass appears to consist of hard rock salt, having the color and transparency of clear ice, and containing over 90 per cent of the chloride of sodium. This formation extends along the eastern bank of the Virgen, presenting a bluff face to the stream for a distance of over twenty-five miles, and is in some places several hundred feet thick.

This deposit is worked after the manner of an open quarry, the salt being removed in blocks weighing often many pounds each. Although blasting is sometimes necessary in breaking it out, large quantities of quite pure salt can be obtained here at very little cost. Some twenty miles up the river is another hill of salt. In the same neighborhood, at a point one mile north of the Colorado river, on a mesa composed of small pebbles, earth and boulders, occurs a circular opening about 100 feet across, and of great depth, forming a sort of natural well, with nearly vertical sides. This is filled to within about 50 feet of the top with water, supersaturated with salt, this pool being apparently all that is left of the "dead sea" which once covered the entire region. These salt beds are in an isolated locality.

The other more notable salines of Nevada consist of salt springs on the line of the C. P. R. R., near White Plains, Churchill county, where there are large vats for making salt by solar evaporation. These vats are shallow excavations, enclosed with low embankments, with which the brine is run, being lifted with pumps from some of the springs. Most of the mills in Virginia City and throughout western Nevada are supplied with salt from this source.

As it fairly represents a large class of these deposits, a description of the general features of this Sand Springs saline will serve to convey a pretty good idea of the whole. The saliniferous land at this place occupies a depressed portion of an extensive alkali flat, this depression being always marshy, and, during the wet season, covered with a few inches of water. Spread over it is an incrustation of impure salt from two or three inches in thickness, brought up by efflorescence from below. In collecting the salt this crust is broken up and scraped into heaps with broad wooden hoes, the ground being divided into long strips, which are gone over in regular order. These heaps, after being left to drain off for a few days, are carried out on wheelbarrows or cars and thrown on platforms, where, after undergoing some further drying, the salt is sacked and is ready for shipment. As soon as this surface incrustation has been stripped off, it begins to re-form, the process going on so rapidly that several crops can be gathered yearly. As the ground below is heavily charged with salt, the process of replacement, were the surface removed, would no doubt go on indefinitely. The salt collected here, though not very clean, being mixed with a small percentage of sand, soda and other impurities, answers well for metallurgical purposes, the alkali present tending to clean the quicksilver and intensify its action. A large portion of the alkali flat outside of this depression is covered during the dry season with a thin coating of salt, generally too high and too much filled with foreign matters to be gathered.

The Great Salt valley is forty miles north of Sand Springs. Under the top incrustation here comes a stratum of blue clay eighteen inches thick, and then a lead of crystallized salt.

In the easterly part of Esmeralda county, and having the town of Columbus as a center, is a series of immense alkali flats, containing heavy deposits of salt. At Rhodes Marsh, one of these group, hundreds of acres are underlaid by a hard pan of solid salt, more or less mixed with mud and sand. Into these, holes something like tanners' vats are dug and soon fill with water holding salt in solution. The water evaporating, in five or six weeks the salt is left. At Silver Park, forty miles southeast of Columbus, incrustations of salt cover several hundred acres. There is also a marsh twenty miles south of the old overland stage road, near the Utah line, and 175 miles west of Salt Lake. In early summer the marsh is covered several feet with water from melted snow. Late in the season, when the water evaporates, a crust of salt, from two to eight inches thick, is left. Mills in that part of the State are supplied from this marsh. In Big Smoky valley, Lander county, and in Cortez District, sixty miles further south, large areas of ground are found covered with a thin crust of salt. In fact, workable deposits of salt occur all over the State of Nevada. The active season of work at most of the deposits is from April to December. There are some $75,000 or $100,000 invested in the salt business in that State. Indians and Chinamen as well as white men are employed.

Mexican Smelting and Refining.

In the last number of the PRESS was given a valuable and interesting article by Mr. A. Gmehling, of Parral, Mexico, on "Smelting in Adobe Furnaces and Refining in the Mexican Vaso." This very crude method of ore reduction is applied in many parts of Mexico. The figures given by Mr. Gmehling show conclusively the irrational and primitive method of this work. The question forcibly presents itself, Whence the enormous loss of the respective methods? Part of the causes, Mr. Gmehling correctly surmises, will readily be found in the improper construction of the furnaces, which are usually erected at very slight expense. The smelting capacity of such furnaces is very limited, and the ores remain in contact with the rising gases for an extensive period. The oxide-lead ores are therefore partly reduced far above the actual line of fusion, and a large percentage is carried off with the fumes. Owing to the slow sinking of the charge, some of the reduced lead becomes again oxidized, when near the form, and subsequently enters into the slag. The loss of silver always naturally corresponds with the loss of lead, similar to the loss of quicksilver and silver in the process of amalgamation.

The slag from such furnaces, Mr. Gmehling states, are mostly rich in lead, and have a high specific gravity, consequently not permitting a thorough separation of the matte and lead. Such an impure slag usually contains from 10 to 20 ounces of silver to the ton, and from 10 to 20 per cent lead, whereas others, considered more or less pure, very rarely contain less than 5 ounces silver and 8 per cent lead. Another cause of loss is the old method of the Mexican smelter, who invariably makes his charges with litharge, products of furnace, rich in lead and slag, as it is transmitted from one generation to another, and entirely ignores the usual addition of proper fluxes as practiced in other countries. Iron and lime are considered by him articles of luxury, and it would undoubtedly be extremely difficult to persuade him to add fluxes to the ores, which seems to him entirely unnecessary.

Such mode of reduction is generally applied in Mexico, oftentime making the charges without in the least considering the character of ore to be treated. These smelters therefore always produce a large quantity of matte, even at times exceeding the production of bullion whenever sulphide ores are submitted for reduction. Old slags, as well as those of recent date, are usually considered as a universal solvent for whatever character of ore, and very liberal they are with the use of the same, although every smelter ought to be familiar with the fact that the loss of metals increases with the amount of the resulting slag.

These old and new Mexican slag dumps have therefore considerable quantities of lead and silver stored up, which could likewise be said of the tailings of their "patios;" and the time may not be very distant when capital and science will unite to origiuate suitable enterprises to utilize all this wealth, which is often met with in many parts of Mexico A final success could not be questioned, Mr. Gmehling thinks, as similar ones are now being carried on, yielding large profits, with the old slag and ore dumps in the once classic Greece—the so-called ecvolades of the ancients of the Laurian mountains.

THE approximate earnings of the Mexican Central Railroad for December were $305,000. The subsidies collected to date are $3,045,914.

Gypsum.

Gypsum has been found in many places in California, Nevada and Utah. The heaviest deposits of this mineral in California are in Los Angeles county, where it occurs in beds scattered along the foothills from Caliente to Long Tom, some twenty miles or more. The deposits are of good quality and abundant. It is found also at Point Sal, Santa Barbara county, in great abundance. The deposit has been worked for some time. Other places in California are as follows: San Diego county, along the banks of Carizzo creek, and on the slope of the desert; Tulare county, at the vein of stibnite in crystals; Nevada county, near the Truckee Pass, in beautiful stellar radiations, from half of an inch to three inches in diameter. Fine specimens are brought from the Ojai Ranch, Ventura county. It is found also in the mountains of the Arroyo Grande, San Luis Obispo county. The following localities are represented in the State Museum: Lockwood creek, Los Angeles county; Monterey county; near Breckenridge, Kern county; near Hill's Ferry, Stanislaus county; Posa creek, Kern county.

In the manufacture of hay salt, extensively used on the shores of San Francisco Bay, and described in the second annual report of the State Mineralogist, sulphate of lime (gypsum) deposits from the sea-water in the tanks. This deposit at the works of the Union Pacific Salt Company is estimated by Mr. Winegar to be over 1,000 tons per year. This could be gathered, ground, and washed to remove the salt, in which condition it would be valuable to sow on the lands as a manure. It is a question if there is another locality where so large a quantity of a valuable fertilizer would remain so long unused. At the other salt works the same material forms in proportion to the quantity of salt produced.

Heavy beds of gypsum also occur in Nevada. The mineral is also abundant in Arizona, at the following places, deposited in thin horizontal sheets: In Yavapai county; east of the Rio Verde, about 50 miles north of Camp McDowell; in the pine country east of the Verde settlements; on the Gila river, 25 miles from San Carlos, Pinal county. There it is abundant and white as snow; in the Chiricahua mountains, southeast from Cabesa Peak; on the headwaters of the San Pedro; on the plains of Yuma county; in Mohave county, 18 miles southeast of Santa Maria placers.

In New Mexico extensive bodies of gypsum occur. Rio Arriba, Beruallilo, Socorro, Grant and Valencia counties have large deposits. At Socorro extensive beds occur. The lack of market renders most of these deposits worthless. Gypsum occurs in large beds throughout Montana, and in the Dakota Black Hills. None is mined there yet. In Colorado heavy deposits of gypsum have been found in South and Middle Parks and several other places.

It is curious, that notwithstanding there are so many deposits on this whole coast, most of the gypsum ground into plaster of Paris is imported from abroad. The importations into San Francisco have run down, however, from 19,000 barrels in 1874, to about 4,000 barrels in 1884, owing to the considerable product in California. The principal use of gypsum is an agricultural one. The land plaster, or ground rock, is applied as a top dressing to the soil. A fine grade is used for making casts, models, etc., and a commoner kind for making cornices, friezes, and other forms of interior decoration.

THE SILVER CONVENTION.—The Denver Silver Convention will convene on the 28th inst., when all questions concerning silver will be fully discussed by the representatives. All producers of silver bullion are interested in the result of the deliberations. The discount on silver has become so marked that many mines that would otherwise be profitable are now no longer so, and it behooves silver miners to see that Congress does not legislate adversely to the silver interests of those regions which produce the metal.

THE astronomical day that began at noon, Wednesday, was only half a day, and at its end, the hands of the great twenty-four-hour clock at Greenwich, were turned to begin anew. A corresponding change was made at the other observatories throughout the world.

A Notable California Invention.

Out of some 10,000 inventions which have been patented in California, nooe has worked a greater revolution in any branch of trade than the Spauldiog insertible saw-tooth, which has for some twenty-five years been used in saw-mills all over the coast. In November, 1882, Mr. N. W. Spaulding patented an improvement, and tho pateot was re-issued in April, 1883. This now form kept the merits of tho old tooth, but overcame what had been conceded to bo objectionablo features. This improvement has not been reached at a single bound, but rather by an extended series of practical tests and experiments, which have required patience and perseverance, besides a large outlay of money.

Ths cutting bit is placed iu a bit-holder and there firmly secured, and is adjusted and removed with the greatest facility; and, when adjusted, its staying qualities are such that nothing oan displace it, except the tool made for tho purpose—save accidents which no saw tooth could resist.

Ths bit-holder is firmly secured to the plate of the saw after the plan of the original patent, which safely protects the plate from cracking, there to remain intact until worn out.

It is so constructed that the cutting edge of the tooth is so far removed from the plate of the saw that tho greatest wear comes on the bit holder itself, thereby protecting the plate, more particularly that part immediately back of the tooth-point. This of itself is a great desideratum, it being a well-known fact to those who havo used the ebisel-bit that the plato of the saw immediately back of the tooth becomes very soon worn so thio that the socket holding the bit is thereby seriously impaired, rendering the saw unsafe for further use until cut down and the teeth or bits resot. Maoy saws have thus beeu spoiled by the wear of ooe season, while oone have escaped serious injury.

In the old tooth the sockets became gradually enlarged, and oot uniformly, so that great skill was required to set new teeth in the sockets.

This serious defect in the nse of insertible teeth has been entirely overcome by the new invention. The bit-holder, when once secured in the periphery of the saw-plate, as described, requires no change or removal, but remains as enduring as the plate itself. They are so constructed, as may be seen by Figure 1 of the accompanying eogravings, that they may be used iu any saw having Spauldiog's No. 1 teeth. If the sockets are badly worn it will be only necessary to trim the saw on the rim aod renew the socket, to securely fasten the bit-holder. The cuts show the hit-holder, the bits and keys.

Figure 1 is a perspective view of a hit-holder, full size, and exactly corresponding with the body of one of the No. 1 saw teeth, showiog the socket for the reception of the cutting bit and key; also the notch correspondiog with the lug in the groove of the bit holding io its place and preveuting auy endwise movemeot. It further shows a round notch or half hole io the upper back part of the hit-holder, into which, when the key is adjusted, there is a small copper rivet passed aod headed down. This securely holds the key in place. The round hole shown in the upper back part of the bit-holder is for the purpose of attaching the tool, which throws in and out the sliding key.

Figure 2 shows the cuttiog hits and keys. The first shows a hit, the groove and fixed lug in and across the groove. This lug corresponds to and fits ioto the notch in the bit-holder when placed in positioo, aod constitutes one of the means by which the bit is securely held in place. The second cut in the group, immediately below the hit above described, shows a key which slides into the groove below the hit, securely fastcning it in position. The second and third cut show the under side of a bit aod key, with the tongue and groove upon their meeting faces, calculated to prevent any side-wise movement of either hit or key, and ties them together.

These bits have been used in various kinds of timber in different localities, where they have been well and fully tested, botb as regards the streogth and permanency of their fasteniugs as well as to tbe amount of lumber a set will cut. As regards tbe former they have been found to be entirely satisfactory; as to the latter, a set of hits have cut from 150,000 to 200,000 feet, depending largely upon the kind of lumber sawed and ths treatment they have received at the hands of the user. They may bs resharpened with a very fine file, or an emery wbeel. The insertion or removal of these bits is easily accomplished by the use of a small wrench made for the special purpose, and is attached to the bit-holder at the small hole in the upper back part. This work can be dono by any inexperienced person, and when the teeth are once put in place they are ready for use, and are just as easily extracted.

Figure 3 shows a full-size bit-holder, with cutting bit and koy in position, fitted and ready for use. It will be observed that the cutting point of the bit, as represented in the figure, is 3¼ inches in a direct line to its support in the plate of the saw, by the virtue of which the

Fig. 1.

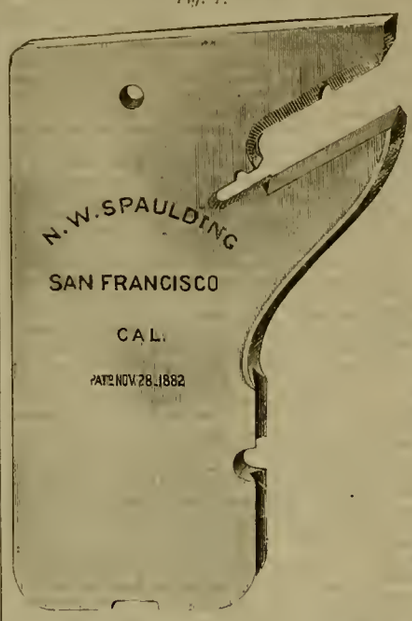

Fig. 2.

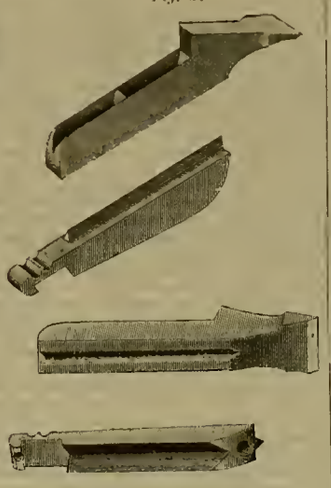

Fig. 3.

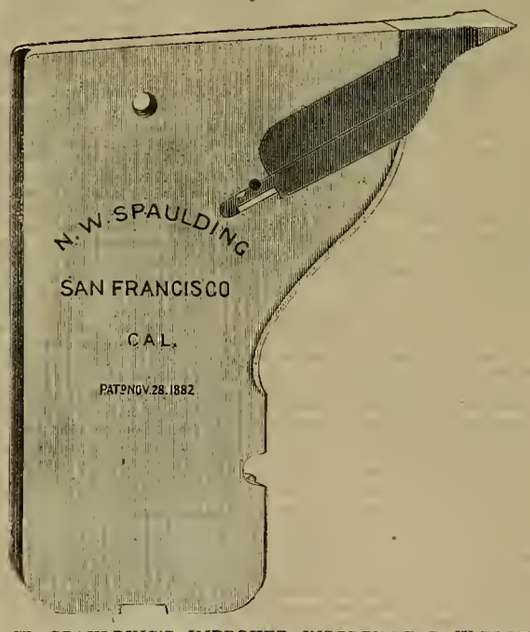


N. W. SPAULDING'S IMPROVED INSERTIBLE SAW-TOOTH.

friction engeodered by the saw-dust is received upon the bit-holder instead of the plate of the saw, as is the case where the cutting bits are placed io close proximity to the plate. Again, the angle in which the cutting point is presented to the timber makes it a free and easy cutter; also, the large open throat afforded by this device enables the dust to be discharged perfectly free in all kinds of timber. These are poiots which must be recogoized as indispensable to the well-working of a saw.

Mr. Spaulding has favorable writteo evidence conceroiog these teeth, from practical saw-mill men all over the coast. The general testimony is, that the lumber can be cut, at a cost for bits, for about one cent a thousand, when directions have been complied with. All seem to agree that a great saving of power is gained iu usiog these bits, increasing the capacity of the mills, in many instances, to nearly ooe-fifth, besides a great saving in the matter of skilled labor. This is another example of a California iuveotion, which has created a revolution in its special branch, and which is in the hands of proper parties to make it a success. In order to extend the manufacture of these saws, both here and in the East, Mr. Spaulding has associated himself with Mr. B. F. Weston, of Oakland, a gentleman of large and varied experience, in the manufacture of lumber in Michigan, and they have incorporated the business under the firm name of the N. W. Spaulding Saw Company.

Regenerative Methods for Copper.

At Oker, in the Hartz mountains, a combinatiou oi different methods is resorted to in the treatment of copper mattes. The ground matte is salt-roasted, but owing to its richness, the chloridation is of necessity imperfect. The oxides formed are, however, extracted, first, with the protochloride of iron liquor from a previous operatiou, aod second, with dilute tower acid; and third with dilute sulphuric acid, 2½ weigh cwt. of chamber acid diluted to 12° Beaume and heated to boiling, being left for ten days on a five-ton tank charge of partially exhausted ore. The precipitate resulting from the first leach liquors is pure; that from the second aod tbird unfit for the direct production of ingot.

At Alderly Edge, England, an ore occurring in a bed of sandstone carrying a small percentage of coppsr, as oxide and carbonate mixed with phosphate and arseniate of copper, has long been treated with dilute hydrochloride acid.

In this case the copper solutions being arsenical, are purified by the addition of protochloride of iron, which is said to precipitate the arsenic as an arseniate of iron, with the production of some free hydrochloric acid. After precipitatiou of the copper the solution, containing chloride with somo perchloride of iron, is concentrated to a specific gravity of 1.4 per cent, and sprinkled over a reverberatory furnace-sole covered with red hot saud, whersby free hydrochloric acid is generated, to bs condensed in a tower and used for leach liquor.

The action of sulphurous acid as a solvent wheo oxidized into sulphuric acid is well knowu. Its indirect action as a reducing and acidulating agent has beeu noted by Mr. James Douglas, Jr., in his article on the humid metallurgy of copper, in "William's Mineral Resources, when describing Zoppi's treatment of the Agardo solutions. This reaction has been taken advantage of by other copper workers and is made the basis of several regenerative methods:

At Agardo, where the leach liquors are run from the vats directly into opeu precipitating vats, the consumptiou of iron was 3.27 to ooe of copper, the cement contained so much basic sulphate as to be unfit for refining. To prevent this, Zoppi, in 1876, treated his leach liquors with sulphuric acid in a suitable tower before precipitating the copper, and as a result reduced the consumption of iron to 2.55 parts to one of copper, and obtained a current fit for the refining furnace.

Foundry Notes.

Business continues quite dull at the foundries aud machine shops, as it has beeo for some months. As comparatively little mining machinery was made here during the past summer, owing to general business depression, the foundrymen are anxiously looking forward to the opening of spriug, in the hope of au improvement in that line. It is expected that a number of mines that needed plants will be supplied this year.

The Risdon Iron Works have completed shipped and set up the new hydraulic machinery for the Comstock. They have had on hand some months the big contract for wrought iron pipe for the Spring Valley Water Company, which has made them exceptionally busy. They have finished and shipped a large mill to be put up in Fresno county for French capitalists. Most of the heavy castiogs were got to the mines before the rains set in, and very little more of the machinery remains to be taken in.

The Pacific Rolling Mills have beeu shut down for a general overhaul. The forge only has been at work on two large crank-shafts. One of them is for the U. S. S. Adams and the other is for the new steamer being built at the Potrero.

At the Union Iron Works shipyard, at tho Potrero, a propellor, 250 feet long, is being built for the Newport Coal Company, as a collier to run to the Coos Bay mines. She will be of about 1,000 tons burden, and will be entirely constructed in all details at the works. The *State of California* is also at the yard, getting in new boilers aud undergoiug a general overhauling. The steam shears used in lifting out her 80-ton boilers are capable of raisiog 100 tons. They were made at the works. They launched from these works this week the new iron caisson for the dry-dock at Mare Island, to which we have before referred in these columns. The dimensions of the caisson are as follows: Length, 81 feet; beam, 18 feet; depth, 16 feet to top of keel, or 17½ feet in all. The interior is divided into compartments, and carries centrifugal pumping machinery. They have been at work on this caisson for some six months. It is operated in the usual way, as a movable gate for the dry-dock.

THE IRON INTERESTS OF THE SOUTH.—Fully 80,000 tons of Southern pig iron have beeo sent into the East direct from the Southern furnaces. Indirect shipments via Cincinnati, Richmond and other distributing points, must materially increase this total.

THE STATE OF NEW YORK.—The State of New York comprises one-tenth of the population of the country, and accomplishes one-sixth of the manufacturing, and one-quarter of the trade. It is truly the Empire State of the Union.

THE work of enlarging the Dismal Swamp Canal, in Virgioia, so as to make it a veritable ship canal, will begin early in the new year. Six years is the limit fixed for its completion.

A Master Mechanic on Industrial Education.

Mr. W. B. Ludlow writes to the Oakland *Tribune* as follows: I had the pleasnre of visiting the mechanical school, under principal T. O. Crawford, at the Lincoln School, in this city, and was surprised and gratified to find the progress the boys were making in practical mechanics. Some of the work was as well put together of could be done by many of the mechanics working at the benches in our shops, and here comes the solution of the question, "What shall he done for our hoys?" Let them acquire a knowledge of some one of the mechanical branches of industry. Give every boy a trade; it will cost nothing to keep it if opportunities should offer in his future career to engage in other and more profitable employment. Teach him that to labor by the hands is as honorable and respectable as to be employed as clerks, hook-keepers or salesmen, or in any of the professions. Let him learn that this is a practical age; that the railroad president is greater than the senator. The engineer and machinist throws the theorist and the vague philosopher in the background, because he deals with material facts. The great scientist of the age must reduce his science to a practical theory of facts, and the man who makes your shoes is of more value to mankind than the expounders of vague and unpractical theories of all kinds. Position and a competence, influence and the esteem of his fellow-men, are the rewards which the world pays to the man that can supply its wants. We want better mechanics, and the brain, the eye, the hand must he educated to attain this end. We must give our hoys an education that will enable them to make a living with their hands; establish technical schools that will enable them to go from the school to the workshop skilled in the particular trades they have selected for themselves. How can we do this? Norway, Sweden, Russia, Germany, Holland, France and England are doing it, and what is

A Startling Fact,

Are filling all of our large shops and factories with skilled foremen for the American hoys to work under; or they go through a high school course and content themselves with a position as clerk, book-keeper or a place in a store, working a full year for a year's hoard and lodging, never aspiring to a home, and, if they marry, keeping their wives in a third-rate boarding-house, and their children—well, God help the poor children! It would be better if we cannot accomplish it in any other way, to abandon the bigb school altogether and establish in its stead a tecbnical school where the pupils who graduate from the grammar school could enter for a term of instruction in the industrial branches of mechanics, and learn a trade so they could master it, and pursue at the same time a higher course of English studies than can be obtained in the grammar grades. If we do not do something of this kind, where is a hoy to learn a trade? The following from one of the daily papers of recent date, hits the case exactly: "When old Stephen Girard, of Philadelphia, died 50 years ago he left the bulk of his fortune for the establishment of a college where poor white male orphans were to be furnished an education until they reached an age when they could be bound out as apprentices to useful trades and occupations." Within the last ten years it has heen found more and more difficult to follow out the provisions of the dead millionaire's will.

The Great Trades Unions.

Have so entirely rooted out the apprentice system that there is nothing left of it. In this emergency the directors of the college have established technical schools on the model of the English schools, in which lads are taught various handicrafts, and with such success that many lads of 16 have gone from these schools directly into factories and obtained good wages. The system is worthy of adoption in other schools, as it is becoming more true every day that the man with a good trade has an immense advantage in practical life over the ordinary college graduate.

Even if you apprentice him to some trade, he hut learns a part of it. If in a machine shop he is put to work on a lathe, and there he remains until he is ont of his time, and he becomes a lathe hand, or if in a factory he is set at some special part of the work, in which he soon becomes skilled, and is kept at it because he is able to earn something for the concern, and when he is out of his time he is

A Specialist, and Nothing More;

He could not superintend that machine shop or factory no more than he could fly, hut make a hand to work under the direction of some one educated in the technical schools of Europe.

Remember, the cass of our nail factory—skilled labor had to be imported, and then made their own terms, among others that no apprentices would be taken.

So if the trades unions will not let the boys learn, and the owners of our large industries will not take an interest in them, the Government must.

I believe in education and in our free schools and am proud of Oakland's pre-eminence in her schools. I feel it is the duty of the Government to give every child on American soil, no matter what its condition or who are its parents, a thorough education in reading, writing, arithmetic, the English grammar grades, and a trade. I understand the importance of an education to the youth of the land and the relation it hears to the perpetuity of the American Union and its free institutions in the future. But I also see that with our present system of teaching ths hrain and filling the ranks of doctors, lawyers, educators, hook-keepers and clerks to overflowing, and for whom Europe has no room, we are injuring ourselves while Europe is teaching her sons the art of industrial mechanics, and doing it well, sending them to our shores and driving our sons from the positions that are naturally theirs to the professions, or which is more likely, to the lowest menial employment. We will have to look this problem squarely in the facs; it is upon us, and for the welfare of our children we must move swiftly and firmly in the right direction.

Who Made the First Flannel?

At various times the question has come up, Who made the first flaunel in the United States? But it has never been successfully answered as yet. That it was made on hand-looms, and home spun, there can be no doubt. And, as it was not necessary to send such flannels to any mill to be finished, it will he at this late day difficult to trace out who was the original maker of this material. "Away down East" it used to be common to make and use what was called there "woolen sheets." They were home-made, the yarn, both warp and filling, being hard-twisted, and, when woven, they were simply washed out and worn in that condition, there being no nap raised on them. But the question now is, "Who made the first flannel?" and in reply to this query a cotemporary says: We once received the following reply from an old "veteran." But it is possible that some of the old stagers in the commission business may throw more light on this question.

Now it is in the memory of people living in and around North Andover, Mass., of a certain old lady who came to this country from Rochdale, England, sixty years ago or more. She went hy the name of Dolly Howarth, and, if my information is correct, she was the first to weave a piece of genuine wool-flannel in New England, if not in America. If such be the case, I think it is nothing hut right and just to her memory that the credit he given to her, and be recorded in the archives of Massachusetts. She had a grandson living a year or so ago, and he may be living yet. His name is Andrew Howarth. He has heen connected with flannel manufacture all his life, and the last the writer heard of him he was running a flannel mill with his son in Vermont somewhere; I think in Northfield, but am not sure. If Mr. Howarth, who is now getting along in years, could be induced to write what he knows about the matter, I think he could throw considerable light npon it. Mr. Howarth has been in every branch of a flannel mill, from a card boy up, and I suppose is at present the oldest practical flannel maker on this continent, his first lessons being taken in North Andover or immediate district. The writer worked for him more than a quarter of a century ago. If it is so, that a woman made the first piece of flannel in this country, let it be known from one end of the continent to the other; if not, let us try to find out who did.

PRISONERS IN RUSSIAN MINES.—Where prisoners in Russian mines conduct themselves well they are sometimes permitted to live in small houses near the prison after two or three years' incarceration. This privilege is accorded most frequently to married men. Presentations of clothes are often made to help them along. The convicts consist mostly of murderers and robbers, but a very small proportion being political offenders. These latter scarcely ever work in the mines, being kept in a prison apart from the others, and possessing more comforts. The laborers are not at all in harmony with the Nihilists or their principles, and they are kept apart more for the sake of peace than for any other reason. This is the only gold mine in Siberia in which convicts are employed. Ahout 1,000 of them are worked in some of the silver mines, under the same conditions as govern the others. A working day usually consists, in summer, from daylight to dusk—6 A. M. to 8 P. M.—with two or three hours intermission for meals. The work of each one is marked out hy the superintendent, and the diligent and expert miners are allowed to go home as soon as their daily allotted task is finished. Very little is done in winter on account of the extreme cold and short days, during which time the convicts do not work at all.

FORMERLY THE LAKE SUPERIOR MINES controlled the copper trade of this country, but the discovery of great deposits of copper in Arizona within the past few years has changed all this and the stocks of the Lake companies have been seriously, if not permanently affected thereby. The attempts on the part of the latter to discourage western production by deliberately knocking down the price of copper have utterly failed and their own shareholders have been the principal losers. It is known that the Arizona ores contain a percentage of copper so much greater than those of the Lake Superior mines that the western producer, though a greater distance from market, is able to compete successfully with his rival of the Lake region.

Mining.

Says the Salt Lake *Tribune:* It is only fair to give honest credit where it is due. The times are hard, hut still the hig theater is thronged nightly, and the merchants who deal in holiday goods, all report a wonderful trade. These things require a good deal of money. There is but one source it could have come from this year. That is the mines. In wages, in payment for supplies, and in freight, they have distrihuted among the people a heavy percentage of their output. Except for them, a general paralysis would be upon every hranch of business in this region. Men should make a note of this, and when they look up from the smiling valleys to the hlue hills beyond, they should keep in thought that the hills have quite as warm hearts for the people as the valleys. We have often asserted that the only really legitimate business of this region, at present, is mining. We hold that the present situation is conclusive proof of the truth of this statement. The miners need fuel, and the heavy trains are set in motion to supply them. It requires men and fuel to run the trains; it requires other men to mine the coal; the silver mine pays all the expenses. The machinery of mill and hoisting works wears out or hreaks, and the forgers at once start their red fires to supply the want; the silver mine pays for it. The miners give up thirty-three per cent of their earnings for food. Boarding-house keepers seize upon this, and with it buy of the farmers their products. The mine pays for all. So it runs down through the whole list. The fountains from whence all the streams of money flow are the mines. And they are not like any other customer. There is no harter in their payments. For everything they pay in gold and silver is no drain upon the world's hoarded wealth, for the mines create it. If there was just food enongh for the people here, and some merchant was to hring in as much more, the result would be a fearful breaking down in prices. But if suddenly a new mine were to be opened, there would he more machinery, more men, more houses, more teams, more fuel and food, and the find would touch with a new thrill every channel of trade. That is the difference between mining and every other kind of husiness. That is where the inestimable blessings of paying mines are seen.

SILVER MINING IN RUSSIA.—Silver mining in Russia is not profitable, and is carried on hy the Government, principally for the purpose of giving the people work. The ores are mostly galena in character. Oxides and carbonates are found in some parts of Siberia. As a rule, the silver with lead ores is not rich and rarely assays over $50 a ton. The shafts are seldom very deep, rarely exceeding fifty feet. The machinery is very primitive, and is mostly worked hy horse-power. There is very little steam machinery. In consequence of these crude materials for working ores hut a small profit is yielded. There is only one five-stamp mill in the country for quartz ores which contain some free gold. That is in the Altai mountain mining district. In the Ural mountain gold-mining district crushers are used for the gold quartz. The entire gross yield does not exceed more than half an ounce per ton, or about 1,000 pounds per year. There are very few regular silver veins. The ore is usually found in pockets, and there are plenty of them. After going thirty or forty feet helow the surface the hottom usually drops out. In the Altai mining district there are some shafts in silver mines 400 feet deep, hut deeper sinking is impossible, on account of the weakness of the pumping machinery. Sometimes pockets are found which cover a surface of 25,000 square feet. Lodes are generally found 500 or 600 feet long. There are no private corporations handling silver mines, on account of their small yield as compared with gold. There are only a few of such organizations, composed entirely of Siberian capitalists.

GOOD BRICK.—There are excellent brick now being made at Bullionville. The brick is of a cream color, four inches broad and eight and a quarter inches in length, two and a half in thickness, and weigh five pounds. They look like the Milwaukee brick. These brick are made from the water clay, hy William M. Roberts, of Provo City, Utah, who uses a Sword & Son's steam-power press. The brick are not burned, hut are set out and dried hy the sun, or in the heating room. They are solid and have a clear ring when you tap them. They are the best and most durable brick we have ever seen in this country. Those who have seen the machine work at Bullionville say it surpasses any brick-making machine they have ever seen.—*Pioche Record.*

FOUL SMELLING GASES.—The men who are at work in the drifts on the 2700, 2500 and 2300 levels of the Union Consolidated mine are just now a good deal troubled with foul-smelling air or gases. As the water rises, so also rises a large and very able stink. This is about the same thing as a "stench," but is rather more robust and capable. This bad smell appears to be a combination of the dissolved powder smoke from the walls of the drifts, the rancid grease cooked and set afloat from the engine and pump stations, and the dead and foul gases forced out of chinks and fissures in the rock by the rising water. This foul air is not dangerous, but it is described as abominably nasty.—*Virginia Enterprise.*

"Missing the Paper."

Subscribers vs. Publishers.

Naturally, every subscriber wishes and expects to receive the paper he subscribes for regularly and promptly. A failure to get a copy of any one issue is certainly aggravating to one interested in the contents of his favorite publication. However trifling the loss may appear, it is a matter of considerable importance to him. As a general rule, no blame attaches to the mail service. Its arrangements for transmissions and delivery are excellent and deserving the highest encomium. To those few subscribers from whom we receive complaints, we say the reason must usually be found somewhere else. It may be taken for granted that all papers, which should be mailed, are forwarded from the office promptly at the proper time. To err is human, and mistakes will occur, but it would be unreasonable to suppose that they will occur repeatedly to the same subscriber. Years of experience has enabled us to adopt a system in the mailing of our publications almost perfect in its every detail, and our readers must certainly recognize the fact that it is to our own interest to see that they get their papers promptly and regularly. There are causes, though, which are beyond our control. One cause is the illegible manner in which some send in their address; sometimes agents or others write the names wrong. Although many of the postoffice employees rival Œdipus of old in the solving of riddles, there are many instances where even their keenness fails to grasp the incomplete directions furnished by subscribers, and, of course, copied by the publishers. Write plainly your *full* name, street and number, town and county, and in most cases we will guarantee you will experience no disappointment.

Then instances are known in the cities where parties, leaving early in the morning before the delivery of the mail, have locked their rooms and remained away all day. That losses may occur in such cases is certainly not surprising, for the postman has performed his duty when he leaves it at your door.

For instance there are often two John Smiths or Thomas Browns in the same town, the same ward, or on the same street. If the paper is labeled J. Smith, and it sometimes goes to John Smith, and at other times to James or Joseph Smith, John will declare his name is all right on the list, and the publisher only sends it half the time.

Before denouncing the publisher (who, on succeeding in getting his papers to 999 subscribers out of 1,000 promptly, is more anxious to get it to you regularly than you are to receive it), inquire pleasantly, but persistently, at the P. O., and of different persons, at different times, if more than one is in the habit of handing out the mail. Make sure that the delivery clerk understands the correct pronunciation of your name and its proper spelling. Sometimes the mail for Knight's Ferry goes to Knight's Landing, and in two or three days finally gets to the right place.

Generally, when a subscriber will write directly to the office his full address, and state plain facts about missing numbers of his papers, the difficulty will at once be remedied, missing numbers remailed, and the papers received regularly thereafter.

But it is not always a case for us simply to print the name and address correct on every issue of the paper, and put it carefully in the P. O., and pay the postage.

If we cannot get the paper through O. K. after a first notification, do not make the atmosphere blue in the neighborhood by denouncing the faithful publishers—a thousand safe miles away from you, perhaps!—but use the better and less exhausting method of writing a second letter or postal card. This will make us feel worse, because it brings the matter so much nearer home. A council will be called, including the manager, chief subscription and mailing clerks. If the subscriber has a foreign name, sounding peculiarly different from what it looks in English print, we have hopes that the P. M., in a little time, will get the name, the man, and the paper associated together in such a way that he will receive his copies as regularly as they are issued.

If the initial is C, in an odd name pronounced, as if beginning with K or S (as Croft *vs.* Kraut, or Center *vs.* Senter), we may confidently hope that the P. M. will finally learn to look in the C box and deliver the paper, instead of saying "it hasn't come."

There are so many Eurekas in California and Nevada that we have had to print extra explanatory words on some labels. One time "our council" made the discovery that there is a "Columbia avenue" and two "Columbia streets" in S. F., and one or more J. B's and J. S's live on every one of them. So when we, for instance, make the address, "John Jackson Brown, Tailor, No. 24 Columbia street, off of———street, between———and——— streets, San Francisco," J. Brown gets his paper every time, and all are mutually happy after that. They giving the full name and occupation often makes the delivery O. K.

With papers directed to the halls, when societies meet in the evening only, we have had a great deal of trouble; and some janitors, threatened with losing their situations, have begged and promised to be more careful hereafter about leaving the papers about the hallways, etc.; but we know that will not cure the evil. Have the paper directed to some officer or person who is in his place during the entire day, and the trouble will be cured.

A little less difficulty arises when the paper is sent to an office where there are several desks, and the subscriber occupies his only an hour or so a day; or when the paper is sent to a shop or store where there are several partners; or a boarding house where several persons of similar names reside.

Green hands in the postal service may, for a time, stand in the way of correct transmission. We cannot name all the difficulties, but believe the above-mentioned are the most frequent.

It is a singular fact that more complaints arise from subscribers who take monthly publications than semi-monthlies, and semi-monthlies than weeklies. This may arise from the fact that weekly subscribers call more frequently, and always at about the right time for their papers.

We sincerely regret that a single patron should have occasion to complain, but before censuring us we urge them to weigh well all the possible causes, and see first if the fault is not their own. We will always endeavor to make good all missing numbers, and cheerfully rectify all errors that may have occurred at this office. In other words, subscribers not receiving their paper regularly are requested to report at once at this office, mention the numbers missed, when their cases will receive prompt attention.

Technical Education in England.

A conference of representatives of trades unions with members of the Artisans' Technical Association was held at Anderton's Hotel, Fleet street, under the presidency of Sir Philip Cunliffe-Owen, C. B., to consider the best means of placing before artisans the important work in which the association was engaged. The Rev. H. Solly, a Vice-President, stated that the association was established three years ago, to enable artisans to promote technical knowledge and handicraft skill among their fellow-workmen, and to aid them in submitting their views and experience concerning technical training to government departments, public bodies and associations of artisans. He held that it was especially incumbent upon trades unionists to maintain a standard of workmanship as well as a standard of wages, and to this end it was desirable that they should co-operate in the formation of technical classes near workmen's homes, which would supplement the instruction given in the large central institutions where technical instruction was given—such, for instance, as the Polytechnic Institution. The Chairman said international exhibitions—which he likened to battlefields of human industry—had shown that Englishmen were no longer superior to foreigners in certain trades, and that the latter, by means of facilities for technical education by which they profited, were enabled to compete successfully with British artisans. He eulogized the trade syndicates which existed in Paris, consisting of employers and employed, whose object was to improve their manufactures and advance their mutual interests. Each syndicate made a report in the form of a small printed book, and, after much difficulty, he, in 1878, procured copies of several of these books, translations of which might be usefully circulated among British workmen. Means might not be readily obtained for providing special class rooms, but employers might consent, after business hours, to afford accommodation in their establishments for technical classes for the benefit of their own workmen and others engaged in the same particular trade. Further, he thought that employers might be disposed to contribute toward the payment of the teachers and other expenses. He was anxious that the work of British artisans should continue to speak for itself by its inherent excellence, as it did at the international exhibitions of Paris and Vienna, and, as he confidently believed, it would speak again at the Paris Exhibition of 1889. After some discussion, it was unanimously decided to request the trades unions of the United Kingdom to assist the association in its efforts.

THE NEW LIME COMPANY.—The California Lime Company, which has undertaken to develop some immense and very superior lime ledges that crop out of the hill side of the North Fork canon, a short distance above Clipper Gap, are making very satisfactory progress with their work, and by early spring expect to have everything in readiness for burning and shipping lime on an extensive scale. The work at present is under the superintendency of Mr. W. P. Murry, who, from his energetic disposition and experience, seems to be an excellent man for the place. From the site of the proposed kilns to Wildcat Station, a point about half way between Clipper Gap and Applegate Station, where it is proposed to put in a switch and side track, the distance is about two and a quarter miles, and the grade up which the lime will have to be hauled will not exceed ten inches to the rod. The new road between these points is now more than half finished, and being pushed ahead as fast as the weather will permit. The company proposes to build four large patent kilns, the foundations for which have already been commenced. The ease with which the rock can be quarried, and the facilities for obtaining cheap wood, coupled with the great advantage they will have by reason of being so close to the railroad, will enable this company to supply the demands of the coast for lime at a price with which it will be difficult for other manufacturers to compete; and in addition to all these other advantages their lime rock is very superior, insuring of course a superior quality of lime. The company is strong financially, and composed of successful business men, and the indications are now that they will make this one of the big enterprises of the county.—*Placer Herald.*

THE NORTHERN COUNTIES.—Under this heading the Marysville *Appeal* says: "Immigrants are arriving in this State at the rate of from 1,000 to 1,500 per week, and a fair per cent of the number are looking to the northern counties for lands and future homes. No pains are being spared to send all the assistance possible to the people who seek new homes in either Yuba, Colusa, Butte, Sierra, Plumas, Tehama, Lassen or Modoc counties. There are fair lands to be found in all the foothill counties, but they should be pre-empted by young men of energy and small capital. There are fair lands for sale in Colusa and other counties, which can be had at low figures, and which will make the owners rich in twenty years hence. Heretofore Southern California has had the monopoly of the immigration to this coast, but the tide is turned, in a measure, and Europeans and Eastern people are looking at the open lands in the northern counties."

USEFUL INFORMATION.

PINE WOOD SHAVINGS are being more and more largely utilized in Europe for stuffing purposes. At Pesth, in Hungary, a large factory is exclusively devoted to the production of such shavings which latter, by the aid of machinery, are reduced to such a degree of fineness that the resulting product resembles tow. Pine wood shavings are claimed to be superior to every other substitute for horsehair in connection with upholstering purposes, whether as regards elasticity, softness or durability. For bedding, such shavings are recommended by reason of the resin contained in the wood being an effective preventive of vermin. The German Ministry of War, has tried the material for bed-stuffing purposes, and has expressed its high approbation of its merits both for hospital and barrack use. After having been used as stuffing for five or six years, the shavings can be renovated by being exposed to the heat of the sun, or to a heightened temperature. As regards wear, pine shavings are said to compare favorably with horsehair, while the cost is naturally far smaller.

AN EASY TEST FOR LUBRICANTS. The manager of any mill may, at very little expense determine for himself all the conditions of safety and economy in lubricants as indicated by the standard of heat developed upon any given shaft. The apparatus required for this purpose is merely a thin brass tube closed at the lower end, and two thermometers. The method of using this apparatus is as follows: Place enough water in one of these tubes that the bulb of the thermometer will be immersed; insert the tube in one of the holes in the cap of the journal, so that the lower end of the tube will be in actual contact with the shaft, hang the other thermometer free alongside; then gauge the relative heat developed with oils and with greases. Each man may thus satisfy himself as to which is the best and the safest.—*Ex.*

THE USES FOR COPPER have greatly increased, and hundreds of things are now made of copper that were formerly made of chesper metals, or not made at all. The rapid progress of electrical inventions has required an immense consumption of copper for electrical machinery and lighting. Practical use has shown that copper wire is cheaper and more satisfactory than iron wire for telegraph and telephone lines, and the copper wire trade alone is enormous and constantly growing. Tons upon tons of wire of different varieties are now kept in stock, though only a short time ago such a thing was unknown in the trade. Immense quantities of copper are used in house hardware, water fixtures, railroad supplies, clocks and fancy goods, and it is claimed that for roofing the metal is cheaper than tin.

FRUIT STAINS.—Most fruits yield juices which, owing to the acid they contain, permanently injure the tone of the dye; but the greater part may be removed without leaving a stain, if the spot be rinsed in cold water, in which a few drops of aqua ammonia have been placed, before the spot has dried. Wine stains on white materials may be removed by rinsing with cold water, applying locally a weak solution of chloride of lime, and again rinsing in an abundance of water. Some fruit stains yield only to soaping with the hand, followed by fumigation with sulphuric acid; but the latter process is inadmissible with certain colored stuffs. If delicate colors are injured by soapy or alkaline matters, the stains must be treated with colorless vinegar of moderate strength.

BASKET-MAKING IN GERMANY.—Basket-making in Germany, which was begun in a modest way not many years ago, has developed into an important branch of industry. It employs no fewer than 39,000 people, and the ware finds a profitable market not only at home but in many foreign countries. The demand for the raw material has given quite an impetus to willow culture in Germany, and trees better adapted to the needs of the manufacturer have been introduced. About 200,000 hundred weight of willow withes are annually imported. The people of the village of Heinburg, who redeemed 300 acres of swamp lands a few years since, and devoted them to willow-planting this year realized about $1,750 from the sale of the withes to the Saxon and Wurtemberg manufacturers.

TRACING PAPER.—Transparent tracing paper is made by a variety of processes. One of the most approved methods is the following: Dissolve a piece of white beeswax, about the size of a walnut, in half a pint of spirits of turpentine; then having procured some fine, white tissue paper suitable for the purpose, lay it on a clean board, and with a soft brush dipped in this liquid, go over one side, and then turning the paper over, apply it to the other side; then hang it up in a warm place to dry. It will be ready for use in a few days. Some add a small quantity of resin, and others use resin alone.

The above method of preparing transparent paper is said to be decidedly preferable to the use of paraffine.

CEMENT FOR PATCHES ON SHOES.—The cement used in patching the uppers of fine shoes is generally made by dissolving gutta percha in chloroform until the mixture is about as thick as syrup. Scrape and pare clean around the hole to be covered, and thin carefully with a chamfer edges of the bit of leather to be applied. Only a little of the cement is needed, but the surfaces must be pressed close together. The parts will adhere firmly in a few minutes.

LEAD COATED IRON NAILS are recommended for attaching slates for roofing purposes. Plain iron nails, and also (though less rapidly) tinned or galvanized nails, used for this purpose, are found not to be very durable. The cause is suspected to be the corrosive action of sulphurous acid and sulphuric acid, resulting from the combustion of coal, which invariably contains more or less sulphur. The lead coating of the nails is suggested as an effectual remedy, as this metal is insensitive to the action of these acids.

TO SOFTEN RUBBER RINGS.—The rubber rings used to assist in keeping the air from fruit cans, sometimes become so dry and brittle as to be almost useless. They can usually be restored to their normal condition by letting them lie in water in which a little ammonia has been placed. Sometimes they need not remain more than five minutes; but frequently a half hour is required to restore them to elasticity.

THOSE who use brass or porcelain letters on glass windows know how often they drop off from unequal expansion, or from the too energetic efforts of window cleaners. They will be glad to have the following recipe: Litharge, two parts; white lead, one part; boiled linseed oil, three parts; gum copal, one part. Mixed just before using. This forms quick-drying and secure cement.

THE FURNITURE INTEREST in the United States is a very important one. Three years ago in New York it amounted to 300 factories and a product of nearly $10,000,000. Cincinnati had 119 factories, with a product of $4,500,000. Chicago turned out above $6,000,000, Philadelphia, $5,000,000, and Boston, $4,000,000.

EXTENDING OUR MANUFACTURES.—The Turkey-red damask goods which are now being made in this country are of a class which have always been imported until within two years. Only the Bates mill, Lewiston, Me., and the Renfrew mill at North Adams, are now making them in this country.

OIL CLOTH may be improved in appearance by rubbing it with a mixture of a half-ounce of beeswax in a saucerful of turpentine. Set this in a warm place until they can be thoroughly mixed. Apply with a flannel cloth, and then rub with a dry flannel.

GLASS SHINGLES are now used and bid fair to become popular. They are strong, durable and cheap.

IMMENSE numbers of paper bottles are now made and used in Germany.

GOOD HEALTH.

Waking One's Self at Will.

An old problem of the psychologists has been revived by a letter to *La Nature* written by a French business man, who mentions that for years he has been in the habit of waking himself at any hour in the morning he wished, simply by impressing upon his mind before going to sleep the fact that he must awake at that hour, and saying further that he seldom varies five minutes from the moment which he had assigned himself. We have a very distinct recollection of many instances in which we have ourselves tried the experiment with success, and at one time, when it was necessary for a considerable period for us to wake on certain days of the week at a very early hour, to take the first train to the place where our services were then needed, we had an opportunity of studying the circumstances under which this peculiar species of self-control is most easily exercised.

During this period we found no difficulty in waking regularly within about five minutes of the time necessary to enable us to reach the train comfortably, although for a portion of the time this involved getting up long before daylight; but we discovered also that in order to wake with precision at the right moment, and to rest quietly un il it arrived, it was necessary to look at our watch just before going to sleep. If we neglected this precaution we were apt to sleep uneasily, waking first an hour or more before the proper time, and allowing ourselves in consequence only short naps afterward until the minute arrived for getting up. Whatever part of our mind it might have been that took charge of waking us seemed to begin its count of the hours from the time at which we composed ourselves to sleep, and if we did not inform ourselves of this our conscious reckoning was correspondingly uncertain and the effort to wake vague, but if we took a clear note of the time in the evening we could sleep peacefully through the whole of the alloted interval, sure of being aroused at or very near its expiration. Another condition of waking we found to be the occurrence of some small external event, through which, as it were, the internal effort could take effect upon our senses. A very trifling circumstance—the flutter of a leaf outside the window, the chirp of a bird or any other of the innumbered sounds of early morning—was sufficient, if it happened at the right time, to wake us by a sort of magnifying process which at that moment gave the power of startling us by a noise which would at other times be unnoticed; but without such sensible impression we think, we should not have waked. In fact, on one or two occasions we remember to have been impressed with a dim consciousness of waiting for something to happen before waking, and a moment later a stifling sound would open our senses with a little shock To the necessity of waiting for this impression, small as it might be, we were disposed to attribute the variation to a minute or two either way from the exact moment assigned for waking, which might otherwise be kept with exact punctuality. —*American Architect.*

Heart Beats.

Dr. N. B. Richardson, of London, says he was recently able to convey a considerable amount of conviction to an intelligent scholar by a simple experiment. The scholar was singing the praises of the "ruddy bumper," and saying he could not get through the day without it, when Dr. Richardson said to him: "'Will you be good enough to feel my pulse as I stand here?' He did so. I said, 'Count it carefully; what does it say?' 'Your pulse says 74.' I then sat down in a chair, and asked him to count it again. He did so, and said, 'Your pulse has gone down to 70.' I then lay down on the lounge, and said, 'Will you take it again?' He replied: 'Why, it is only 64; what an extraordinary thing!' I then said: 'When you lie down at night that is the way nature gives your heart rest. You know nothing about it, but that beating organ is resting to that extent; and if you reckon it up it is a great deal of rest, because in lying down the heart is doing ten strokes less a minute. Multiply that by sixty, and it is six hundred; multiply it by eight hours, and within a fraction it is five thousand strokes different; and as the heart is throwing six ounces of blood at every stroke, it makes a difference of thirty thousand ounces of lifting during the night. When I lie down at night without any alcohol, that is the rest my heart gets. But when you take your wine or grog you do not allow that rest, for the influence of alcohol is to increase the number of strokes, and instead of getting this rest you put on something like fifteen thousand extra strokes, and the result is, you rise up very seedy and unfit for the next day's work till you have taken a little more of the 'ruddy bumper,' which you say is the soul of man below."—*Gaillard's Journal.*

FANCYING HIMSELF AN INVALID.—There are many persons who think they are invalids when they are not, and there are many who claim sympathy on that ground who are in no sense entitled to it. They might shake off their invalidism by exertion if they would. A little effort of the will, a little self-reliance, a little determination, and they would become well. Such persons, however, generally have weak wills and are negative characters. We knew one of them who could always be made ill by telling him he looked pale. On one occasion three persons played a joke on him to test this matter. One met him on his way to work and said: "Good morning, why you look sick this morning, what is the matter?" "Oh no, I am quite well," he replied. A few moments later the second one met him and said: "What is the matter with you, you look pale." To which he replied, "I'm not feeling at all well." The third one said: "You look as if you ought to be in bed." To which he replied he was feeling quite badly, and in an hour he quit work and went to bed sick. Yet this man lived to be very old and was never really sick, but was only so in his imagination.—*Herald of Health.*

A HUNDRED YEARS OF LIFE.—Dr. J. M. Peebles, of New York, has written and published a work entitled "How to Live a Century, and Grow Old Gracefully." The author does not maintain that every person who has been born with a defective constitution, or who has lived a life of dissipation can live a century; but that persons well born and with good habits ought to nearly, or quite, round up a life of usefulness of one hundred years' duration. In his preface he says: Human life being both the gift of God and a blessing, it is a duty to preserve it as long as possible. No truly good person, however aged, ever outlived his or her usefulness. In all enlightened lands old age is considered honorable; the hoary head is a crown of glory. In preparing the work the author seems to have aimed to be practical rather than original or elegant, bringing to mind and clearly presenting the vital importance of air, food, drink, clothing, sunshine and sleep in such varied ways as to inspire the reader with a proper and persistent use of them that the number of years upon earth may be many—even *a hundred!*

THE MODEL HEALTHY MAN.—The man who lives an idle life, be he a sturdy vagrant or fine gentleman, even if he is ever so healthy, is not our model healthy man. The pattern healthy man is one who lives long and vigorously; who in every part of his life does the largest amount of the best work that he knows how to do, and when he dies leaves healthy offspring. The healthiest country is that which produces the largest number of such men, who do the greatest variety of good work for the longest time. Of course the word man is used in its broad sense, and includes women also.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

FURNACE.—Amador *Ledger*, Jan. 3: S. D. Shugert has built a furnace for roasting sulphurets upon the Amador Queen property in Hunt's gulch. The furnace has a capacity of roasting 800 pounds at a time. Mr. Shugert is an expert in chlorination matters. The reduction works at Drytown are at a stand-still, we believe on account of the bad condition of the roads putting a stop to hauling sulphurets from the mines in El Dorado county. W. G. Anderson has made arrangements with San Francisco men to start work on the New York quartz claim, located two and a half miles southwest of Jackson. Notices are posted up calling for bids for running 500 feet further north in the big tunnel at Middle Bar, contractors to furnish powder, fuse, etc., and to prosecute the work with three shifts of not less than four men each. Bids will be received until the 5th of January. All hands at the tunnel were discharged at the end of last week. For the last 700 feet the work has been done by men employed at so much per day, but a return to the contract system has been determined upon, hence the notice for proposals.

SUTTER CREEK.—Since the heavy rains the flow of water in the Mahoney has exceeded the capacity of the pumps to keep under control. The water is steadily gaining, and fears are entertained that the mine will be flooded. A new five-stamp mill is to be built for the Iowa mine as soon as the weather will permit.

Fresno.

QUARTZ MOUNTAIN DITCH.—Cor. Fresno *Republican*, Jan. 3: On the 3d inst. the earth and rock excavation on the line of the Quartz Mountain Mining Company's ditch was virtually completed. It has been a work of great magnitude, and the completion of the excavations in so short a time through the rugged country over which the line passes is a matter of much surprise to every one conversant with the great difficulties that were to be surmounted. The line of the ditch is a fraction over 21 miles in length and traverses a section of country that is very rugged and precipitous, and covered to a large extent with a dense growth of chaparral, which required to be hewn to the ground before the grade line of the survey could be established. There are three tunnels on the line of ditch, the aggregate length of which is 573 feet. The maximum grade of the ditch is 12 feet per mile, and the minimum is 6 feet per mile. The capacity, roughly estimated (allowing a reasonable margin for loss in leakage and evaporation), is about 4,000 miner's inches. The width of the ditch, on top, is an average of about 9½ feet with slope of sides at 45 degrees.

Inyo.

FURNACE.—Inyo *Independent*, Jan. 3: There is but little probability that the furnace at Elna will be started up again soon. The property has now been in the hands of the sheriff for several weeks, and before work can be resumed all the claims against the concern, amounting to several thousand dollars, must be satisfied. The means for doing this are not very apparent. James Stansfield found a good prospect a few days ago in Black canyon. He has put men to work to develop the claim. Greenly and Broder resumed work on the Cliff mine about two weeks ago. The mine has been idle during the past year or more. Two sample lots of the ore, each weighing a ton, have been found to go, one fourteen and the other fifteen hundred dollars per ton. Thomas C. Boland has leased the whole mining property at Cerro Gordo, including mines and furnace. Mr. Boland will put a full force of men at work immediately, and all the old-time bustle and activity is likely to be seen at Cerro Gordo before spring opens.

Mono.

MILL CREEK EXIT.—Bodie *Free Press*, Jan. 3: With the winding up of assessment work in Mill creek district there is a general exodus among the boys that will nearly depopulate the camp for the winter. A party to-day consisting of Wm. Robson, Paul Rouze, Angus McDonald, Wm. Ray, R. A. Sawyer, Hugh Kennedy and the village shoemaker leave for Quartz mountain. They attempt what might be termed a perilous journey—over the Sierras on snowshoes, via Tioga Pass.

Mariposa.

BEAR VALLEY.—Cor. Mariposa *Herald*, Jan. 3: The Morning Star has been anxiously looked upon for some time past as an oasis in the desert, but from present indications it seems probable that we will have to wait a while before we receive any assistance from that source. If this mine was in the hands of the right parties, by a reasonable outlay of capital to develop it, it would no doubt become one of the richest mines in Mariposa county. The situation of the mine and facilities for working are No. 1, and the mine has every indication of being a good one if opened out. By a comparatively small outlay of money and labor a good wagon road could be built to the mine so that machinery and supplies could be shipped to it as easily as into any town in this county.

Nevada.

TO START UP NEXT SATURDAY.—*Transcript*, Jan. 4: The new ten-stamp mill of the Secret Treasure and Cornucopia mines in Washington district is almost completed, and crushing will be commenced next Saturday. There is a large quantity of rich-looking ore already out, and more is being extracted. The company will soon be among the regular bullion producers of the county.

THE ALASKA MINE.—*Transcript*, Jan. 1: Two loads of machinery for the Alaska mine at Pike City, left here Tuesday to arrive there yesterday. There are one or two more loads to go up immediately. The rock-breaker which recently arrived by rail cannot be delivered till the roads improve, on account of its great weight. A pump weighing 26,000 pounds has been ordered and is expected here this month. It will be hauled to the mine as soon as the roads are in good enough condition. The Alaska continues to produce liberal quantities of the wonderfully rich ore for which it has recently become famous.

BULLION.—*Transcript*, Jan. 5: The shipments of bullion from neighboring mines through Wells, Fargo & Co.'s express office at this point during the month of December, amounted to $1,116,500. That is not a very bad showing, considering that there is nothing being done by the hydraulic miners.

Sierra.

BALD MT. EXTENSION.—*Mountain Messenger*, Jan. 3: Bald Mountain extension incline, Forest City, is up over 150 ft, leaving but 90 ft incompleted. Everywhere the gravel is rich with gold, and the prospect is that the new year will develop another Bald Mountain, whose gross yield has already exceeded $4,000,000. H. Thomas and J. Adams, at St. Jo Bar, near Goodyear, have their tunnel 700 ft in a bench above the river, and are sluicing gravel that pays very well. Dan Loring has sold his gravel claim in Hog Canyon for $1,000. He also received a handsome Christmas present, and thus has been fortunate all around. Dan must have been born under a lucky star.

IN FULL BLAST.—Sierra *Tribune*, Dec. 26: Supt. Lowry has put a full crew of men at work in the Bald Mountain Extension mine, at Forest City, since the storm set in, and the washing of gravel has already begun. It is only a question of a short time when the stockholders in that mine will receive dividends regularly every month.

A PAYING DRIFT MINE.—Sierra *Tribune*, Jan. 3: The Empire gravel mine, at Howland Flat, has for some time past been yielding about 50 ounces of gold per week. There are 45 men employed there at present.

A $3,000 QUARTZ BOULDER.—In the Ironbound placer mine, owned by Jim Denoon, and located near Gibsonville, a quartz boulder was discovered by mere accident recently, that is estimated to contain $3,000 of gold. The boulder weighed between 200 and 300 pounds, and a streak of gold running through it the thickness of a $20 piece.

MINING SUIT.—Sierra *Tribune*, Jan. 2: The Marguerite Mining Company have brought suit against Charles Qurrillo to restrain him from so operating his placer mine at Loganville that the debris therefrom will flow into their ditch and flume. The plaintiff prays for $10,000 damages, and also ask for a perpetual injunction enjoining him from continuing work in such a manner as to injure their property.

San Diego.

A NEW MINING DISTRICT.—Arizona *Sentinel*, Jan. 2: At a meeting of miners held at Gold Rock Camp, near Ogilby, on December 15, 1884, a new mining district was organized and given the name of the Ogilby mining district, with boundaries as follows: Commencing at Ogilby section house on the line of the S. P. R. R., near Yuma, thence running in a northeasterly direction a distance of ten miles; thence in a northwesterly direction, twelve miles, thence in a southwesterly direction to Cactus station, thence along the line of the Southern Pacific Railroad to Ogilby station, the place of beginning. The ores of the district are free-milling gold, and are found in large bodies of high grade. Two shipments of ore have already been sent to San Francisco and milled, and gave good returns. Another shipment of several tons, which is the third inside of three months, is now in San Francisco. The mines are situated four and a half miles from Ogilby station, on the line of the S. P. R. R., and are in San Diego county, California. They were discovered by P. Walters, of Santa Monica, last January. Previous to this above discovery the same class of ore was only found in Durango, Mexico. Some idea can be formed of the magnitude of the ore bodies from one claim called the Black Butte, which shows a body of ore forty ft in thickness and six hundred ft in length. An open cut has been driven twenty ft into the ledge, which is all in pay ore. Assays made from this cut have milled $100 per ton in San Francisco. There are three other bodies of ore of the same dimensions and value. One other claim has been opened by two cuts and shows 64 inches of ore that will mill $200 per ton. The true location of the discovery has been kept secret until lately, when a regular mining district was formed and its laws established. The officers of the district are: P. Walters, president; Edwin Laundy, recorder, and P. J. Kennedy, secretary. A load of ore was sent to San Francisco a week ago last Saturday for reduction, and another last Monday. The owners complain that they have to pay $40 per ton freight to San Francisco, which is three times as much as the Calico miners pay on high-grade ore to Denver, Colorado. As a consequence, they will erect a mill on the Colorado and cease shipping ore to San Francisco.

San Bernardino.

CALICO.—*Print*, Jan. 3: Work is progressing on the Sun, the principal mine in West Calico. J. P. Madson and Jos. Laswell have bought the Peck Bros. lease on the Bullseye mine. They have also leased the Silver Moon, adjoining the Snow Bird, and have extracted several tons of good ore, which have been taken to the Daggett Sampling Works.

NEW YORK DISTRICT.—New York district, situated some twenty-five miles north of the Mojave Division of the Atlantic and Pacific railroad, embraces within its limits of ten miles square, the heaviest timbered and best watered section of the long mountain range of that name. Messrs. John McBride and Wm. Miller are the principal owners in the large group of mines in New York district. For about ten years they have been doing the assessment work on about a dozen mines, besides prospecting carefully, and as a result their dumps are covered with a large quantity of ore, the greater part of which is low grade, averaging from $40 to $60 to the ton. The mines in this district have large, bold ledges, which indicate permanency, and judging from the ore uncovered by the numerous prospect holes, there is sufficient to keep a ten-stamp mill in operation indefinitely, and which would result in a steady income of a high percentage on the investment. Messrs. McBride and Miller, assisted by J. S. Rainy, are now working on these mines and feel confident that they will be able to put them in such a condition as to attract capital, and offer inducements that will guarantee the erection of reduction works and the prosecution of developments on an extensive scale.

Trinity.

NEW RIVER.—Trinity *Journal*, Jan. 3: Mr. Brooks informs us that Messrs. Love and Hall have discovered a very rich lode on the ridge about half a mile above the Mary Blane which is unquestionably an extension of this famous mine, as the rock is exactly of the same character and prospects equally well. The new find is on top of the divide and exactly in line with the celebrated Klamath and Black Bear mines. He also learned that a very rich silver mine had been discovered on what is known as the Happy Camp Mountain, lying between the New River mines and Willow creek. It is reported to be six feet in width and very rich. There are at present from 60 to 100 men in at the New River mines, principally engaged in getting out timber and erecting buildings. Provisions are scarce and it is doubtful if there is enough on hand to last until spring. Prospectors are advised not to rush in too early.

NEW RIVER.—Humboldt *Standard*, Jan. 3: We learn from Oliver Clements, one of the owners in the Hard Tack mine, that they have plenty of ore out and expect to keep their arastra running all winter. They will work a ton and a half of rock per day. The arastra is run by water power. There will be two stores opened in the spring at the point known as New River City—one by Mr. Campbell, of Trinity, and the other by Frank Loring, of Calihan's Ranch, Scott's Valley. White Rock now has the start. Alex. Cœur & Co. have a large store at the last place, where is kept an abundant supply of provisions, mining tools and everything needed in a mining camp. Pete Larsen, late of Arcata, has a store at this point, which he runs in connection with his hotel and saloon. The Mary Blaine saw-mill is getting out a good supply of lumber for mining purposes. The 5-stamp quartz mill is all ready to start up work on the ore from the Mary Blaine mine. Gus Gutsen has struck the ledge where it is two ft wide in his claim. Mr. Clements thinks this one of the most promising mines in the district. The rock shows free gold. The gold is very fine and seems to be distributed all through the quartz. The Yankee Boy mine, owned by Boles & Co., is turning out fine ore. More work has been done on this mine than any in the district. A tunnel has been run 200 ft and connection made therewith by a shaft 100 ft, thus giving excellent ventilation. The company have a five-stamp mill all ready for operation as soon as Mr. Boles arrives with the fine screens. We will soon have good news from the Yankee Boy. Mr. Cœur, who arrived in Eureka yesterday, says he met 15 persons bound for the New River mines as he came out. There has been no snow since the storm the last of September. There has as yet been no need of fire except for cooking. Mr. Cœur, who runs a large store at White Rock, deemed it necessary, on account of the daily increase of population, to procure an additional supply of provisions. He will return next week with a train of goods. One of his trains has just gone in with five tons of flour. When he gets back he will have a sufficient supply to run the camp until the middle of May. He reports all in the camp working and well satisfied with the prospect. C. C. Dennis and L. Miller have taken a contract to put up an arastra for Tom Baker and Wm. Levasseur, to work the ore from the Tough Nut mine. The arastra will be completed in 30 days. Seventy-five tons of ore are now on the dump at this mine. Mr. Cœur reports meeting Mr. Loveland at Blue Lake, bound in. The latter will put a force of men at work on the Helen Mar mine, and keep them employed as long as the weather will permit. Everything looks favorable in the new camp.

Tuolumne.

A LUMP.—Tuolumne *Independent*, Jan. 3: Some time ago Mr. Thomas Whitto found a seven-pound lump of pure gold in his quartz mine near Jacksonville. Several coarse pieces of gold were found near it. This large piece was crusted with white sand, which prospected well. Inside of this was a white sand cement, which had to be cut off with a chisel. The lump being so heavy induced Mr. Whitto to persist in getting at the interior of the ball. At last the chisel exposed the gold, which proved to be pure, without a particle of quartz mixed with it, and weighed within a fraction of seven pounds. The Keeffe mine, at Santa Maria, still looks well. The vein has increased to ten inches in width, and is spangled with free gold. The Tioga mines have closed down for the winter. A few men will remain there. In the spring the mines are expected to blossom into prominence. The Tioga road via Big Oak Flat will be opened early in the spring. Messrs. M. Shine and D. Oliver struck another pocket of several hundred dollars at Brown's Flat, Monday. The Santa Maria mine closed down for the winter a few weeks ago. Too much snow to work to advantage is the reason.

A PROMISING MINE.—*Union Democrat*, Jan. 2: S. H. Teeters brought some very fine gold quartz to this office Thursday. It shows a considerable quantity of free gold, and contains besides a heavy percentage of high-grade sulphurets. It comes from the Hogle & Daegner mine at Sugar Pine, of which Mr. Teeters is now the sole owner. The mine was operated many years ago, but was abandoned on account of business reverses of the former owners. Last spring Mr. Teeters cleaned out the old workings and opened up the ledge. He was fortunate enough to strike a ten-inch vein of quartz, of which the above described is, he says, a fair average sample. The ledge between the walls is about five ft in width, but much of it is horse matter. However, ten inches of the kind of stuff shown us is a pretty good bonanza in itself. There is a tunnel 200 ft in length on the vein, which makes the mine very convenient. There is plenty of cheaply utilized water-power close at hand, and any quantity of fuel all around to be had for the cutting. The ten-stamp mill of Messrs. Long and Hampton at Jacksonville is kept steadily pounding away on ore from the Williatta mine. Mr. Hampton says the returns are up to their most sanguine expectations. As soon as spring opens he says they will enlarge the mill and increase the crushing capacity. Sinking in the Dead Horse mine has been temporarily suspended on account of the flow of water which cannot at present be handled. A new boiler is being put in place, and as soon as it is up the pump will be set to work and sinking resumed.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Jan. 3: The west drift on the 500 level has reached the east side of the old workings and three drill-holes in its face are drawing off the water. The flow amounts to 23 inches. It is thought that the old workings are now about drained, but there is no way of getting into the 500 level above to measure the water. On the 1500 level a winze is being sunk at the end of the west cross-cut from the main south drift to connect with the northwest drift on the 1750 level of the Con. California and Virginia, and from the 1750 level an upraise is being made to meet this winze. The connection will give a good circulation of air on both levels.

HALE AND NORCROSS.—Work was discontinued on the 2800 level at the time of the accident to the Cornish pump at the Combination shaft, and has not yet resumed. A second cross-cut, 60 feet north of No. 1, had just been started on the 2800 level, and was out about eight feet when the Cornish pump was disabled. Work cannot be resumed until the pumps are again running in proper shape, as the compressed air is all needed at the shaft besides the running of bailing tanks filled the lower levels with steam, and renders them very hot.

COMBINATION SHAFT.—The broken pump bob at the 1000 level was repaired yesterday. Pending the manufacture of a new hose piece for the bob, the pump has been kept running at about half speed and the bailing tanks were also kept going, thus handling the water without difficulty. The new hydraulic pump is about ready to start up. The two discharge columns are connected at the 2600 level, and it only remains to connect the supply columns.

YELLOW JACKET.—A considerable amount of low-grade ore is being extracted from the old upper levels, and the mills on the Carson are kept in operation. A good deal of work is being done in the way of prospecting for new deposits.

CON. CALIFORNIA AND VIRGINIA.—An upraise is being made from the northwest drift on the 1750 level to connect with the winze now being sunk from the 1500 level of the Ophir. This connection will give a good circulation of air on both levels.

SIERRA NEVADA.—A north drift is being run on the 2500 level from a point about 100 feet west of the winze that goes down from the 2500 to the 2900 level. The drift is following vein material of a favorable character.

GOULD AND CURRY.—The main west cross-cut on the 825 level near the Savage north line is in a mixture of quartz, clay and porphyry of a favorable appearance. Frequent stringers of mineral-bearing quartz are found.

BEST AND BELCHER.—The west cross-cut on the 825 level at the Gould and Curry north line is still in vein material of a very promising appearance. Streaks of quartz are occasionally met with that give low assays.

ALPHA.—The work of prospecting a large body of quartz developed on the 600 and 900 levels is still continued, and frequent bunches and stringers of pretty fair ore are found.

UNION CON.—An east cross-cut was started on the 2700 level, night before last, at a point some 200 feet south of the main winze. The pumps hold the water at the 2700 level very easily.

CROWN POINT.—A considerable amount of ore that will pay a small profit for working continues to be obtained in the old upper levels. This ore keeps the mills on the Carson river in operation.

SAVAGE.—The E-street tunnel now has less than 50 feet to go to reach the point where it is expected that low-grade ore will be found. The tunnel is already in a vein formation.

BELCHER.—The old upper levels continue to yield a considerable amount of low-grade ore, which is being sent to the mill on the Carson river for reduction.

OVERMAN.—The extraction of ore through the old Petaluma-street tunnel has been discontinued, as it was found to be of a grade too low to pay for milling.

ALTA.—The east cross-cut on the 1350 level is still in quartzite of a promising appearance. The water continues to rise, but very slowly.

SCORPION.—The main north drift on the 500 level is still being advanced through vein porphyry and other vein material.

MEXICAN.—The main south drift on the 2700 level has been cleaned out and repaired.

Columbus District.

MOUNT DIABLO.—*True Fissure*, Jan. 3: The workings on the sixth level show no change. The upraise from the fifth level has connected with winze No. 2, and a stope has been started on a small streak of ore at the foot of the raise. The ledge near winze No. 1, on the fifth level, looks promising, and is giving considerable $35 ore. The west drift on the fifth level has advanced 10 feet, and has shown a foot of $75 ore for this distance. The stope started near the face of the drift shows 18 inches of $75 ore. A small amount of ore is being taken from between the fourth and fifth levels near winze No. 1, and also from between the third and fourth levels near the same winze. The stope between the second and third levels, east of the shaft, shows a narrow ledge of $175 ore. The stope between the same levels, west of the shaft, is giving considerable $50 ore from a promising ledge. A small amount of ore is being taken from the second level, and also from the intermediates between the first and second levels.

Eureka District.

THE RICHMOND.—Eureka *Sentinel*, Dec. 31: One would hardly imagine that times were dull after going up to the Richmond works and looking around for a while. Everybody there is busy, and each man is at his particular occupation. Perfect order and system is noticeable, and nothing is left undone to make every dollar count to the advantage of the company. The new Speiss furnace is running splendidly, the molten matter pouring out from the spout in a thin liquid stream, the volume of which is equal to that of a big stream of water pouring from a street hydrant. The big pots are removed from under the spout by means of a crane and ranged around the latter. The lead, which, if left long enough to cool, would stick to the pot, is tapped from the bottom, and as soon as this operation is performed, a horse is hitched to the pot and it is drawn away and the iron dumped out of it in an incredibly short time. The heavy snowfalls prevent custom ores from coming in in the usual quantities, yet there is plenty to keep the furnaces running. It is said that in the Richmond mine they have large quantities of ore reserved for the winter's run, and the general indications are that the company is still quite prosperous.

Grantsville District.

QUIET.—Belmont *Courier*, Jan. 3: Grantville

continues to grow quieter. Better times are in store for it, however, and the chances are a good deal more than even that the old camp will soon be heard from again as a bullion producer.

Hot Creek District.

ORE.—Belmont *Courier*, Jan. 3: Judge Turin, of Tybo, has taken several tons of ore from the New Dominion mine, of Hot Creek district, to Eureka to be worked.

Jefferson District.

ORE SHIPMENT.—Belmont *Courier*, Dec. 27: E. F. Corrillo was in from Jefferson this week. A few days ago he made a shipment of ore from Jefferson to Eureka, where they work ores for $10 a ton. He has one of the finest locations in Jefferson district which he is working steadily. We ought to offer inducements to chloriders in this county so that they could work their ores at home. It would be profitable to the chlorider and mill owner alike it such things were.

Manhattan District.

ORE. — Belmont *Courier*, Dec. 27: We were shown on Christmas, by County Treasurer Adam McLean, some very fine specimens of ore from locations in Manhattan mining district. From what we can learn a judicious outlay of capital would soon make these locations paying mines. London coin is doing the work on them, and we understand that when sufficient of it is done they will be patented. Lack of capital has kept back mining in this county, and it is about time that mine owners "tumbled" to that fact. It is the hardest thing in the world to open a silver mine without money. It is not every day that you can find a silver mine able to stand the bullion discount and the high charges for shipping and reduction. Capital must handle most silver mines before they become profitable investments, and before said capital will do so it must have legislation favorable to silver. These mines in Manhattan district would have remained quiet to-day, but for this London capital to develop them. In this county there are numerous properties that would return handsome profits if capital would take hold and handle them properly. It does seem queer that $15 or $20 ore will pay in Colorado, Idaho and Montana—an $40 ore will not pay in Nevada.

Secret Canyon District.

THE LITTLE MINNA MINE.—Eureka *Sentinel*, Dec. 29: Charley Norton, who, for some time past, has been engaged in sinking a shaft in the Little Minna mine, Secret Canyon, was in town yesterday. He says the shaft is down a depth of 23 ft, and the entire bottom of it is in ore, an 18-inch streak of which assays $120 to the ton, and the balance of the body from $60 to $90. Mr. Norton, who is a miner of considerable experience and knowledge, says the ore very greatly resembles that extracted from the Horn Silver mine of Frisco, Utah. In a few days he will return to Secret Canyon, when he will proceed to erect a building over the shaft and a boarding-house near by for the accommodation of several miners, who will be put to work on the new discovery at an early day. The Little Minna is the property of H. K. Mitchell, Esq., who has the congratulations and best wishes of his many friends.

Taylor District.

TRIBUTE.—White Pine *Reflex*, Dec. 29: John Devlin and S. R. McLaughlin who are doing tribute work on the Monitor mine opposite Hilp's store, have struck quite a large and rich body of ore. Another ore team was put on this morning to haul ore to the Monitor mill, which has been shut down for a few days, for the purpose of making some needed repairs. Twelve men were laid off at the Monitor mine Monday last, but nearly all have been put on again. Bad roads and no dump room for ore was the cause of the knocking off. All the miners in the employ of the Argus Mining Company were knocked off Wednesday. The roads are so bad that the ore cannot be taken away and the dumps are full.

Tuscarora District.

THE BANNER CONSOLIDATED.—*Times-Review*, Jan. 3: The *Times-Review* is requested to state that the Star Spangled Banner and other mining claims have been consolidated and will hereafter be known upon the official records of this district under the above title. The consolidation is made in accordance with the Act of Congress approved February 11, 1875, amending section 2324 of the U. S. Mining Laws.

INDEPENDENCE.—*Times-Review*, Jan. 3: The usual progress has been made at all points, showing no change since last report.

BELLE ISLE.—No. 1 upraise on east vein has been carried up during the last week, two feet; total hight 54 feet, showing no change.

NORTH BELLE ISLE.—The usual progress has been made. The face still continues to look favorable.

NAVAJO.—The east cross-cut, 350-foot level, has been advanced, during the past week, 14 feet. Total distance 70 feet, showing no change. All other work in and about the mine progressing as usual. The stopes are producing the usual amount and grade of ore. The mill will start to-day about noon time.

GRAND PRIZE.—*Times-Review*, Jan. 2: South drift on the 400-ft level has been extended 21 ft during the week. The drift on the 300 is in 28 ft. Progress in the 200-ft level for the week, 18 ft. Repairs are progressing at the mill as rapidly as circumstances will permit. As soon as they are completed, will run through what ore is in the mill.

ARIZONA.

NOTES.—Prescott *Courier*, Dec. 29: Jack McDonald and his men are taking rich ore out of the Blue Dick mine. Men at work in the Buzzard are extracting good ore. A miner who recently came in from Hassayampa and Dosoris district is quite elated with Dave Grubb's mine, which is, he thinks, the mother vein of this portion of Arizona. It has been traced seven miles and carries metal all the way. The ore is very rich, but in general is low-grade. Being in the midst of a fine timber belt, with plenty of water in and near it, the time cannot be far distant when the right kind of people will come here and work this and similiar veins as they ought to be worked. The latest arrival from the Agua Fria district, Michael Hickey, assures us that the shafts are going down in good ore; veins widening and prospects of all kinds encouraging. Of the Pine Spring mine, Turkey creek district, a letter from a friend, in whose statements we have confidence, reads as follows: We have been working on the mine when the weather would permit, started on Thanksgiving day on the new shaft. 300 feet north of the old shaft, going down 50 feet and cross-cutting from the shaft to the vein 10 feet, drifting vein 25 feet in poor ore. On the 17th inst. we broke in on very rich ore, having the appearance of being high-grade, the character of which is oxide and black sulphate of silver. At present we cannot tell how extensive it is, but will let you know if it continues to hold out.

QUIJOTOA.—Cor. *Associated Press*, dispatch of the 6th says: Quijotoa has again gone wild over a recent discovery of what appears to be a new bonanza, rivalling in extent and richness, even the famed Peerless and Crocker. The location of the discovery is upon the western slope of Mount Ben Nevis, upon a claim called the Devon, owned by W. F. Kitt of Tucson, located in December, 1883. The ledge is from 50 to 100 feet wide and from 100 to 150 feet high, and can be seen for a distance of 30 miles. The ledge is coated with white bastard quartz, and, but for its proximity to Bononza group, would have been pronounced valueless by the expert who examined it. A few blasts of powder, when doing assessment work a few days since, demonstrated the entire mass to be a high grade ore, rich in horn and malleable silver. A few months since its owner offered it for $2,000, but could not find no purchaser. Now its value can hardly be computed. It is all the talk here, and the excitement at Quijotoa concerning it is intense.

CLOSED DOWN.—*Silver Belt*, Jan. 3: The heavy and continuous fall of rain, for four days ending last Monday evening, following so closely the recent snow-storm, has completely saturated the ground and rendered the roads deep and heavy. It has practically put a stop to teaming for the present and it will be some little time yet before any considerable amount of coke for the Old Dominion Company, or supplies for our merchants, can be brought in. The supply of coke at the smelter was exhausted Monday evening, making it necessary to close down. Operations at the mine had been discontinued the day previous. It is an unfortunate state of affairs, but a large amount of coke is en route from Willcox and an early resumption at the mine and smelter is probable.

THE MINES AND SMELTER of the San Carlos Copper Company, which were shut down during the recent heavy rain, have resumed and will, it is expected, continue to run. They have about a month's supply of coke on hand. The company have taken a six months' working bond on six claims owned by Jacob Schneider, situated about five miles from their works. The consideration is $1,000. Work has been begun on several of the claims and ore is being packed on burros to the smelter.

THE LYNX CREEK PLACERS.—Arizona *Miner*, Dec. 30: Since Geo. B. Inman secured a lease for the season of the Lynx Creek placers from Governor Tritle and Frank Murphy, the work of hydraulic mining there has been actively pressed for the last two weeks under the direction and management of Harry Carpenter. Fourteen men are kept constantly at work, and their efforts, together with the assistance of over 200 inches of water, will realize a handsome pile of dust for the lucky lessee during the winter. The first clean-up will be made on New Years day, and present indications point to its being an unusually rich one.

COLORADO.

NOTES.—Georgetown *Courier*, Jan. 1: The McLinn tunnel, on Sherman Mt., has cut the St Julian lode. A mill run from the Owasco mine on Brown mountain, last week, returned in three classes, 631, 339 and 210 ounces silver per ton. The double hoister on the Snow Drift lode, which was put in by the Union Manufacturing Co. of this place, started up last Monday. Buel, Sites and Smith, owners of the Hamilton lode, North Empire, have sunk a shaft 60 feet and started a drift east, in the breast of which are exposed two quartz streaks of 18 and 15 inches respectively. The Old Settler mine in Banner district is being steadily worked with encouraging results. A good plant of machinery will soon be erected over the main shaft, as the new-fangled whim is incapable of doing the hoisting. Three excellent mill-runs have recently been made on ore from the Vulcan mine. The first, from Nick Ennis' lease, returned in two classes, 427 and 211 ounces silver respectively. The second from the Johnson lease, in one class, returned 336 ounces. The last, from Myers Bros.' lease, returned in two classes, 686 and 267 ounces silver, and 37 per cent lead. Mr. O. E. Clark owner of the Independence mine in Argentine district, says that during six months of the year he can send his ore to Keystone, a distance of eight miles, and ship it to Denver by way of Leadville, Salida, Canon City and Pueblo, for one dollar less per ton than he can ship by way of Georgetown to Denver. The distance in the former case is over 300 miles, in the latter, 60 miles.

PLUMAS ITEMS.—Mining is brisk at this end of the county just at present, and the mines are averaging fully as high as usual. The reported sale of Mr. Hamill's interest in the Terrible mine, to the company has created no little comment, and the general opinion seems to be that the change will be beneficial to all; it is to be hoped that it will, as this valuable property has for some time been doing but poorly, and it is thought that the company will expend considerable money in putting it in shape again. A few of the lucky lessees on the Baltimore made Supt. Fillius a Christmas present of a handsome gold watch, worth $240. The Stevens mine is showing up splendidly and many of the lessees are preparing to remain all winter.

DUMONT.—A contract to sink the shaft on the Monitor lode an additional 50 feet, has been let. Recent tests from this vein gave five ounces in gold to the cord. In the west drift on the second level on the Albro, the boys have just exposed a vein of solid ore about eight inches in thickness, of a very good grade. Work is now progressing on the Night Hawk lode. From present indications, Dumont will be quite a lively camp this year, as quite a number of old properities are to be developed.

IDAHO.

THE RED ELEPHANT.—Wood River *Times*, Dec. 31: Mr. Richardson who resumed work on the Red Elephant group of mines, at Bullion, when Dr. Miller's bond expired, about three weeks ago, is beginning to think that he will have as good a mine as there is at Bullion. A few days after regaining possession, Mr. Richardson cut into an ore-vein 8 to 14 inches wide, which has already yielded 10 to 15 tons of ore while being opened. A shipment of 12 tons was ready when the storm began, which will be brought to Hailey as soon as the roads shall permit it. The ore is evidently of good grade, and carries all of 125 ounces silver per ton.

LESSEES STRIKE ORE.—Kunkle, Buckland and Nicol, who leased the west end of the Narrow Gauge No. 2 mine, and began work on the 20th of November, have struck a good sized kidney of ore from which they have already extracted between 10 and 12 tons, with as much more in sight. The ore is fine galena and carbonates, and will, it is believed, average 150 ounces per ton. They resumed work where Supt. Clarke quit, two years ago, and struck ore within four feet. They are running a tunnel to tap the vein at greater depth, and expect to find a still greater width of ore than in the old workings, where it is in 12 to 15 inches.

RICH ORE.—Idaho *World*, Jan. 2: Rich ore was recently struck in the Forest King mine—better than any the mine has heretofore turned out. Four men take out ore as fast as the 5-stamp mill can get away with it. A while back it was the intention of the owners of the mine to shut down the mill about New Years day, for the reason that their supply of wood was limited; but the mill is still pounding away, and will run two or three weeks longer, and may continue running all winter. It is no easy matter to get in a supply of wood now, on account of the deep snow, but nevertheless the boys, who have lots of pluck, think of making an endeavor to get wood enough to keep the mill going right along all winter. During the past fall they were kept busy putting up their mill and developing the mine, and consequently did not have time to lay in a supply of wood.

MONTANA.

BANNACK CITY ITEMS.—*Inter-Mountain*, Dec. 29: One of our friends at Bannack City furnishes the following interesting batch of items from that section: Snow is 18 inches on the level. Bachelder Bros. are working three men. Snow between Bannack and Elkhorn is 22 inches on the level. Assessment work is being done on a number of good properties. Hayes & Co. are working 10 men on the Blue Wing property and in good ore. W. M. Lewis & Co. are sinking on their placer claim with encouraging prospects. The New Departure is a bonanza with a large amount of ore on the dump. Bean & Co. are working 15 men on the Bonaparte lode. They have a 24-inch streak averaging over 60 ounces of silver to the ton. Sears & Co. are working four men on the Delmonte lode. They have two inches of ruby ore that will mill up in the hundreds.

NEW MEXICO.

FROM ALL POINTS.—Silver City *Enterprise*, Dec. 26: Many new and rich strikes are constantly being made at Gold hill. Forty-four men are now employed on the Young Man mine, at Gold gulch. Black and Park the discoverers of Gold hill, are digging a well and preparing to ship ore. A less amount of assessment work is being done at Shakespeare this season than for many years past. Lewis and Cottrell, of Gold hill camp, have 30 odd sacks of rich horn silver and chloride ore ready for shipment. It will run into the hundreds. The new company at Gold gulch are working 30 odd men. They pay off on the fifth of next month, after which the force will be largely increased. It is reported that W. H. Newcomb has arranged to work a number of mines on Legal Tender hill, west of town and treat the ore in the new concentrator. C. C. Fletcher, of Chicago, is erecting a reverheratory furnace of 10 ton capacity at the camp of Tres Hermanas. Mr. Fletcher has purchased considerable property there which he is developing. Mr. L. A. Snyder recently made a very rich silver strike in the neighborhood of Gold hill. The vein is about 10 inches wide and the ore is so completely impregnated with horn silver that assays are unnecessary. Lewis and Cottrell, of Gold hill, have a 23 inch vein of lead which averages about 70 per cent and from $10 to $12 in silver. The most of the vein is almost solid metal. The lead crops out for over 1,000 ft, and varies from two to three feet in width. The company's mill at Pinos Altos has been closed down for some days past on account of the muddy roads, it being impossible to haul ore to the mill. The mill has been running on a 500 ton contract for Dr. Bailey, of this city. The contract would have been finished by the first had it not been for the bad weather. Allen, Richards and Swancoat have commenced work upon the New England claim at Fleming. A rich strike in free gold has been made in the Mogollons by Mr. Kelly. It is said to be one of the biggest and richest strikes ever made in that country. It is reported that a new strike of considerable magnitude has been made in the Peacock is undoubtedly one of the best properties in the country. M. Saulisbury, of the Benson smelter, has offered $100,000 for the Last Chance mine, at Pyramid. Mr. Saulisbury, has treated several thousand tons of ore from this property and doubtless knows more about it than many of the owners. The latter are holding off for $150,000 but it is probable that they will come to terms offered rather than let the property lie idle longer. Ten tons of high grade ore arrived here on Tuesday from John A. Miller's mine, in the Mogollons. The Coeney and Peacock mines are outputting about 100 tons of ore a month and find it difficult to have it hauled away as fast as desirable. Teams are in demand, both here and at Kingston. A test shipment of one carload of ore was recently made from the Last Chance and Superior mines, to the Grant works at Denver. The result was very satisfactory to those interested. The ore concentrated five tons into one, with a loss of only five per cent. Mr. Grant agreed with the owners of the property to put up works similar to those in which the ore was treated, at Shakespeare, with a capacity of 30 tons daily, for $10,000, run them for three months and guarantee them to successfully treat the ores of the camp. The proposition has not yet been accepted but it probably will be. From Mr. G. G. Posey, who just returned from Lake Valley, it is learned that 609 tons of ore were shipped from the company's mines in seventeen and a half hours one day last week. Eight hundred tons would have been shipped inside of 24 hours but for the supply of freight cars ran out. The ore was hauled from the dumps, loaded on the cars and shipped in the time specified. Specimens of gold nuggets were shown in this city last week by John Barton, which were taken from the Mitchell mine in the Steeple Rock district. The mine is owned by McDonald & Barton and has been worked for several years. The gold occurs in sandstone, which is pounded up and carried down to the creek where it is washed out, yielding from $20 to $40 per day to the man. The property has recently been bonded to California parties for $40,000. There are many other claims in Steeple Rock district which carry free gold.

ORE SHIPMENTS.—Silver City *Enterprise*, Jan. 2: On Monday last the Solid Silver mining company shipped thirteen tons of ore that averaged $800 per ton, from this place. The total value of this carload of ore is estimated at $104,000. The drifts in the lower working of this mine are piled with ore of fair grade which will hereafter be treated at the concentrator in this city or shipped to one of the upper country reduction institutions which receives most of the ore from this section. Everything indicates that Gold Hill is destined to become one of the greatest gold producing districts in New Mexico. For the amount of work done by the claim owners, the camp shows abundance of mineral. Several shipments have been made of ore that runs very high and others will be made as soon as the inclement weather shall have passed away.

OREGON.

THE TRASK RIVER MINES.—*Oregonian*, Dec. 29: Regarding the Trask River mines, of which so much has been said of late, Mr. J. L. Storey of McMinnville gives the following information: The entire country bordering on the Trask appears to be filled with silver. The portion most thoroughly prospected is near the old "Bear Wallow." The specimens sent to Portland from that point were reported to have assayed $1300 to $1400 to the ton. But Mr. Storey says it is his opinion that that was largely exaggerated, as an experienced assayer in Tillamook experimented with rock from the same ledge and could make but $40 to the ton. At the point from which these specimens were taken, those working the mines are erecting homes and preparing to engage in the mining business in dead earnest. Already quite a number of shanties have gone up and more will soon be erected. But the main ledge commences on the upper side of the peninsula, about a hundred yards below where the road crosses, and running diagonally in a southwesterly direction passes through the peninsula, and crossing the river the lead enters the mountains on the west side of the stream. At this point will be placed the rock crusher and quartz mill and other apparatus necessary for successfully working quartz rock. There are already about 50 men in there for the purpose of mining, and if the mines turn out as rich as they now give promise of doing, there will perhaps be from two to five thousand men on the Trask during the next season. A company composed of eight men have been there for some time; have located claims of several thousand ft, and it is this company that will put in the mills. It is to be hoped these mines will prove as rich as reported, as it would not only be a big thing for Tillamook county, but would help out all the adjoining counties to no small extent. W. H. Sitton, of North Yamhill, says the people of this section are considerably excited over the mines that have lately been found on the Trask, and that many will go over to locate claims. Should those mines prove rich, it will be a "feather in North Yamhill's cap," as that would be made the supply depot for the mines and bring a large trade to the place.

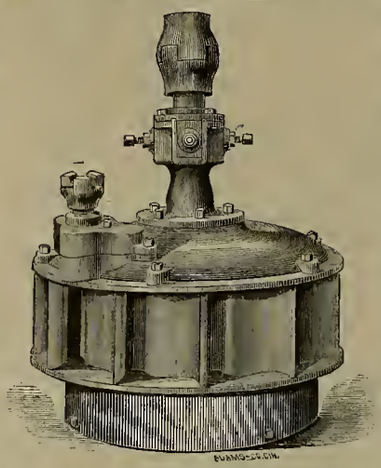
GRAVEL.—Jacksonville *Times*, Jan. 2: Henry Hutchens is in charge of the mines of the English and Blue Gravel companies. Walter Simmons, of Galice creek, has his mines in good shape, and expects to make a good return this season. Since the frosty weather began, the water has been turned out of the Sterling Co.'s ditch as a precautionary measure. The weather of the past few days has not been very favorable for the miners, though we think a change may be looked for soon. Many of the miners were at work when the cold snap began, but most of them are again at their leisure, we are sorry to say. The frosty weather is inclined to dissipate the hopes of many of the miners who have been so badly disappointed in the past few years. Judge Crockett, of Josephine county, informs us that a party of Colorado miners are prospecting a quartz ledge near Tunnel 9, and are well pleased with the developments so far. Geo. Schimpf has received word from the parties who intend testing his quartz ledge in Willow Springs precinct, to the effect that they will be on the ground immediately after the holidays. From Anton Rose, who recently returned from Galice creek, we learn that the miners there had an abundance of water when he left—more than usual at that time of the year. They are all doing well, several nuggets of good size having been picked up in some of the claims.

UTAH.

REVIEW.—Salt Lake *Tribune*, Jan. 3: The receipts of bullion and ore in this city, for the week ending December 31st, inclusive, were $180,967.84, of which $156,091.84 was bullion, and $24,876 ore. For the week previous the receipts were $130,299.07 of bullion, and $15,816 of ore. The shipments of Horn silver for the same week were twenty-eight cars of bullion, $70,000; making the total shipments for 1884, as per current weekly memorandums, $2,829,000. The true output was 22,380,027 lbs. unrefined lead, and 1,435,696 ounces of silver, which, at $70 per ton for lead and $1.08 per ounce for silver, would give a total value of the output of this mine of $2,333 851.68. This shows that the daily estimates of value per car, as shipped, were about 17 per cent. too high; but that was a much better current estimate than that of the year before. Out of the gross output were paid four quarterly dividends of $300,000 each. It was decidedly a good year's work. The Ontario shipped for the week fifty-three bars of bullion, valued at $36,921.65, making the total for the year, as per current reports, $1,695,716.93. The true output was 1,179,567 ounces. The Ontario paid regular monthly dividends throughout the year of fifty cents per share, or $75,000 per month—$900,000 in all. And it is good for many more. The Silver Reef district sent up the past week three bars of Christy silver, $5,080, and one car Stormont silver, $1,550; a total of $6,630. The product of the Hanauer smelter for the week was eight bars of bullion, $21,100.

ECLIPSE DOUBLE TURBINE WATER WHEEL

Points of Superiority:



FIRST.—Simplicity, being composed of the smallest possible number of parts.

SECOND.—The Wheel, Outer Case, Register Gate, and Top, each being one casting, and all the work on them being performed by machinery, and fitted to a standard gauge, secures the highest perfection in construction and operation, and the utmost strength.

THIRD.—The entire absence of rods, bolts, levers, light castings, or "traps" of any kind, securing the greatest durability, with entire immunity from derangement of parts and breakage, so common in all complicated wheels.

FOURTH.—The conical interior of the wheel, which secures perfect freedom of vent for both tiers of buckets, enabling the wheel to rid itself immediately of "dead water" without friction. This feature is entirely original with this wheel, and is found to be of very great practical importance.

FIFTH.—Its "Duplex Chute," formed by the Register Gate and outer case. The outer case moulds the current of water, delivering it in a solid body through that part of the Chute comprised in the Register Gate on to the wheel. This Chute being fixed, the direction of the current is never changed, nor its velocity checked, consequently nearly the same per cent. of power is obtained with the gates only partially drawn as when fully open.

SIXTH.—A Gate thoroughly protected from vertical pressure, which, when partially closed, does not break the column of water or change its proper direction, which is easily operated, and yet shuts so tight as to prevent leakage; and the shutting of which is not likely to become obstructed or prevented by foreign substances.

SEVENTH.—The housing up of the pinion and segment for operating the gate, which entirely prevents all danger of breakage by foreign substances getting between the teeth. No other concern does or can use this improvement, which effectually does away with a source of most frequent annoyance and delay.

EIGHTH.—The amount of power it yields, together with its Simplicity, Durability and Strength, fairly entitles our wheel to the name given it, The Eclipse Turbine. In further proof of the power of this wheel, we invite a careful inspection and comparison of our tables with corresponding tables for all other similar wheels.

TATUM & BOWEN, Sole Agents,

Nos. 25, 27, 29 and 31 Main St, San Francisco, Cal., and Portland, Oregon.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

Of the City of San Francisco.)

PREMIUMS AWARDED.

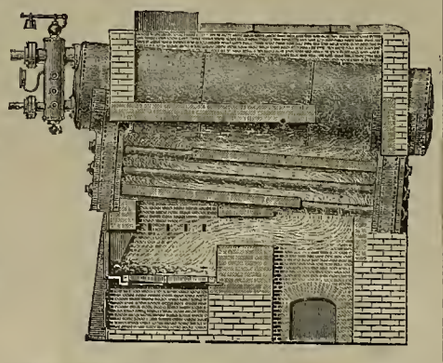
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

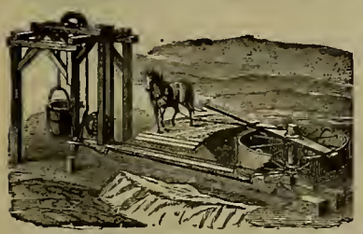
MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 In Actual Use.

EDWARD A. RIX & CO.,
MANUFACTURER,
18 and 20 Fremont St., - San Francisco

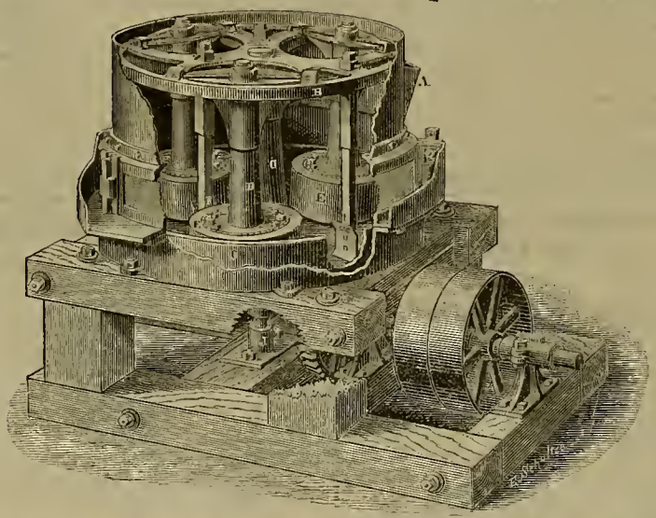
INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

A. CHAMBERS,
Jackson, Amador Co., Cal.

L. PETERSON,
INVENTORS. MODEL MAKER,
258 Market st., N. E. cor. Front, up-stairs, S. F. Experimental machinery and all kind of models. Tin, copper and brass work.

F. A. HUNTINGTON'S
CENTRIFUGAL ROLLER QUARTZ MILL.



Ecomony in Expense of Plant. Economy in Cost of Working. Economy in Saving Gold. Economy in Transportation of Machinery. Economy in Cost of Erection of Mill at Mine. Economy in Time Required to Establish Plant (one day only being consumed).

The Huntington Mill has passed entirely through the experimental stage. Two years of continuous use at a number of mines in California has enabled the inventor to perfect and improve the machinery until he feels justified in assuring the public that he has reached THE ABSOLUTE in the construction of a perfect Quartz Mill.

Giant Powder.

Its Power and Uses.

Alfred Nobel was the inventor of dynamite or giant powder. He had been using ordinary powder in blasting operations in Swedish quarries, and found the work slow in progressing. Acquainted with the nature of nitro-glycerine, he conceived the idea of soaking common gunpowder with it before blasting. The effect produced was very great, but this only led the way to the greater invention, dynami e—finely pulverized silex, or silicious ashes, or infusorial earth saturated with about three times its weight of nitro-glycerine, and constituting a mass resembling damp graham flour. The power of this compound can only be estimated theoretically, but its uses are manifold and do not need to be specified. Mr. Nobel's invention was not long in attracting attention. It soon came into use all over the civilized world, but, like every other good article, many imitations were put on the markets under various names. He secured patents for it, however, where possible. When it had attained considerable fame, Mr. Nobel was attracted to the United States as a new field of operation. Not being a citizen, he could not patent the article here, but through his friend, Mr. Julius Bandmann, this was finally done, however. Mr. Bandmann was senior partner in the commission house of Bandmann, Nielsen & Co., of this city, a firm dating back to 1849. The firm had been doing business on Montgomery street, but they believed that the future great houses of the growing city would center nearer the water, so they constructed the building at present occupied, 210 Front street, and took possession in 1852. Here they have remained ever since. In 1868 their line of business was changed, and they began the handling of Mr. Nobel's patents. Mr. Bandmann sold to the Giant Powder Company, a new incorporation, the right to use the powder on this coast, and in the following year the entire right for the United States, his firm remaining as general agents. As now organized, there are two factories, one in New Jersey and one here, the Eastern division going under the name of the Atlantic Dynamite Company, and this under the name of the Giant Powder Company; but both being managed by one Board of Directors in San Francisco, with Albert Dihhlee as president, Louis B. Chapman as secretary, and Sather & Co. and the London and San Francisco Bank treasurers. Under the management, three kinds of powder are made—Nobel's Explosive Gelatine, the strongest, a brownish-looking article of the consistency of half solidified glue; the Giant Powder, ranking next; and the Judson Powder. After the Giant Powder had been established three or four years, other companies sprung up, notwithstanding the sole rights which the Giant Powder Company had under the Nohel patents. They are all copies or imitations of Nohel's original invention of dynamite, which is simply nitro-glycerine held in an ahsorhing hody. Nitro-glycerine, in its fluid state, is an oil produced hy the mixture of nitric acid, sulphuric acid and glycerine, and is liahle to explosion when transported in that state. Mr. Nohel changed this into a paste or powder, hy which the nitro-glycerine is cushioned, thus making it entirely safe in transportation or handling. As a hlasting agent the fluid would be impracticable, as it could not he used in horizontal or upward boreholes, except hy putting it in tin tubes or some such appliance. The strength of the dynamite or giant powder depends entirely on the amount of nitro-glycerine used, and as it is a very difficult matter to test this, some manufacturers take advantage of this, using less, so that the power of ths article is lesscned. Consumers, therefore, should only deal with such companies in whose honesty they can have no doubt. Two or thres years ago Mr. Nobel succeeded in producing a still stronger powder than the strongest dynamite, as the strength of the latter is limited hy ths ahsorbing qualities of the ahsorhent used. This is called Nohel's explosive gelatine. It contains 94 per cent of nitroglycerine, whereas dynamite cannot safely hold more that 75 per cent. It is even safer in handling and transportation than dynamite, as it requires for its explosion a specially prepared primer, which is exploded hy a giaut powder cap, whereas dynamite explodes with giant powder or heavy percussion caps alone. This gelatine is entirely impervious to water, and, therefore, specially adapted for submarine hlastings. It has been largely used in the last two years on the great tunnels hored in Europe, for instance, the Arlhsrg tunnel in Austria, also the St. Gothard in Switzerland, and has heen found superior hy those intelligent engineers, who performed those great works, to dynamite. The Judson powder is a low explosive, the result of much experimenting. It is three or four times stronger than hlasting powder, and has met with remarkahle snccess in railroad work on account of its superior strength and crushing qualities. For farm work, such as removing stumps, etc., it is invaluahle. Thesc three powders may he ohtained of Bandmann, Nielseu & Co., and we can recommend the house to our readers. The firm has a reputation estahlished since 1849, and is noted for its reliahility. Its goods are offered at reasonable rates, and can hs relied on to he of the strengtb stated. The guarantee of this firm is sufficient, and we commend it to our readers. As formed at the beginning, this firm still exists, consisting of Mr. Julius Bandmaun, and Mr. Henry Nielsen, under the title of Bandmann, Nielsen & Co.

309,997.—EXTENSION LADDER—S. S. Thompson, S. F.

310,100.—JACK SCREW—W. W. Vaughan, Stockton, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently ohtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROTARY ENGINE.—John C. Edmunson, Salinas, No. 309,296. Dated Dec. 16, 1884. This engine consists of a pair of annular chambers, each of which has a piston adapted to revolve within it, and hoth pistons are connected hy disks with a single central shaft which extends through the casings of both disks, so that the two operate together. In connection with these chambers and pistons is a valvc chamher, a valve by which steam may he admitted alternately to one chamber or the other, and a means for operating said valve connected with the main engine shaft, vertically moving gates which alternately rise so as to open a passage in the chamher to allow this piston to pass and are closed behind the piston, to act as abutments between which aud the pistons steam may act to drive the latter around in the chambers, and cams and connecting mechanism from the main shaft, by which thesc ahutments are operated.

CABLE-RAILWAY-GRIP MECHANISM.—Isaac Hyde, Oakland, assignee of two-thirds to M. E. Willis and Elon De Witt, S. F., No. 309,506, dated Dec. 16, 1884. This is a novel construction of mechanism for operating the grip, hy which a car is connected with a traveling rope or cahle. It consis s in a peculiar construction, arrangement and comhination of devices difficult to describe intelligently without the aid of detailed drawings. In the ordinary constructiou of grips they are placed hetween the front and rear wbeels of the car and the operating lever projects up nearly in the center. In Mr. Hyde's iuvention the grip mechanism is supported in front of the forward axle, and the operating lever is at the extreme front of the car upon the platform with a jointed connecting device, which prevents the movements of the car-body upon its springs from heing commucicated to the grip mechanism or lever.

STEAM ACTUATED VALVE.—George E. Dow, S. F., No. 309,610. Dated Dec. 23, 1884. This new invention of Mr. Dow's, who is one of our most accomplished mechanics aud inventors, relates to direct acting steam engines, such as are applied more particularly to steam pumps. It consists of a main cylinder with a piston reciprocating therein, a piston-rod connecting the piston with the exterior apparatus to be moved therehy, and a comhination of main and auxiliary valves and corresponding parts, and an auxiliary piston hy which hoth valves are moved, the stem of said valve heing connected hy a mechanism outside of the cylinders with the main piston-rod, so that a positive motion is imparted to the valves, and a bracket and guide for the sliding sleeve, through which motion is communicated to the supplemental or steam-chest piston, with its main aud auxiliary valves from the main piston-rod, together with certain details of comhination. The effect of the improved valve is to cut off the steam from the acting side of the supplemental piston when the valves have moved far enough to fully open the main ports. This makes the exhaust cushion still more effective than hefore, as the steam is cut off from acting npon the opposite end of the supplemental piston.

Market Reports.

Lumber at Wholesale.

The market has been moderately active, though receipts have been light of late. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $11; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21. No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No. 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $30; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 refuse) do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and 1x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates—Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.29; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for pine, fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $20.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱ M ft, $38.50; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $30.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.50; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1-½inch, ₱ M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 11 inches, and lengths over 40 feet, extra rates].

Retail quotations of Redwood are as follows:

ROUGH MERCHANTABLE—₱ M ft, $22.50; do Selected, $27.50; do No. 2, $18.50; Surface, No. 1 and Rough Clear, $40; do, 1x6, $37.50; do, No. 2, $30; Rustic, No. 1, 1x8, $37.50; do, No. 1, 1x10, $40; do, No. 2, $35; do, under 10ft, $35; T and G Redwood, 1x4, 1¼x4 and 1¼x6, $39; do do, 6-inch, 12 ft and over, $37.50; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; do do do, No. 2, $30; do do, Beaded, 12 ft and over, $40; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; Half-inch Surface, $32.50; Pickets, Fancy, $30; do, Rough, pointed, $20; do do, square, $17.50; Siding, ½-inch, $27.50; Battens, ½-inch, per lineal ft, 1c; Shingles, ₱ M, $2.50; Shakes, Split, $14; do, Sawed, $12; Posts, per piece, 13c; Dressed Boards, ₱ M ft, $25.

On a credit of 60 days or less, or a discount of two (2) per cent for cash only. On all credits exceeding 60 days' time, not less than one (1) per cent per month to be added.

Under the rules of the Exchange, no "lump" sum will be given on any bill of lumber.

Nails.

We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.75; 8d and 9d, $3.00; 6d and 7d, $3.25 4d and 5d, $3.50; 3d, $4.25; 2d, $5.50.

BARREL.—¾ inch, $6.75; ⅞ inch, $5.75; 1 inch, $5.25; 1¼ inch, $4.50; 1½ inch, $4.25; 1⅔ inch, $3.75; 1¾ inch, $3.50.

LINING.—¾ inch, $7.25; ⅞ inch, $4.75.

TOBACCO.—10d, $3.25 8d, $3.50; 6d to 7d, $3.75.

CLINCH.—6d to 30d, $4.50.

SLATING.—5d, $3.75; 4d, $3.75; 3d, $4.50; 2d, $5.75.

FINISHING.—2d, 1 inch, $8.75; 3d, 1¼ inch, $6.75; 4d, 1½ to 1¾ inch, $4.50; 6d, 2 inch, $4.25; 8d, 2½ inch, $4.00; 10d, 3 inch and over, $3.75.

CASING AND BOX.—10d to 30d, $3.50; 8d, $3.75; 6d, $8.00; 4d, $4.25; 3d, $5.25.

FINE BRIGHT.—4d, $4.50; 3d, $5.75; 2d, $6.50.

CUT SPIKES.—All sizes, $3.00.

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Bullion Shipments.

Christy, Dec. 31, $5,109; Syndicate, 31, $6,600; Argus, Jan. 2, $11,696; Oro Grande, 2, $7,781; Alhambra, 2, $15,210; Germania, Dec. 30, $5,314; Hanauer, 30, $5,200; Nevada, 30, $1,100; Idaho ore, 30, $2,830; Germania, 31, $5,366; Queen of the Hills, 31, $2,800; Hanauer, 31, $2,600; Horn Silver, 31, $7,500; Vienna, 31, $1,970; Germania, Jan. 3, $3,489; Horn Silver, 3, $15,000; Minnie Moore, 3, $5,380; Stormont, 3, $2,960; Crescent, 3, $3,100; Hanauer, 3, $5,100; Ontario, 4, $14,830; Christy, 4, $1,700. The banks of Salt Lake City report the receipt by them for the week ending December 31st, of $156,091.84 in bullion, and $24,876 in ore; a total of $180,967.84

Mining Share Market.

Prices continue rather low in the stock market. Attention is being turned now by mining men and stock operators to the progress of work on the upper levels of the Comstock. At the north end they have now commenced prospecting these levels. They are working on the 2500 level of the Sierra Nevada, and on the 2700 level of the Union Con. The water will now soon be drained out of the ground lying above the 500 level of the Ophir, when a large amount of ground will be opened that is thought to contain much low-grade ore that can be worked to a profit. This ground has not been worked since the early days, on account of it being flooded with water which did not permit tributers to work below the 250 level. As the 250 level has yielded a large amount of ore that has paid for working, much more and better ore should be found on the 500 level, where the ground has not been gonged by tributers. At Gold Hill the Yellow Jacket, Belcher and Crown Point are taking out the usual amount of low grade ore, keeping the mills on the Carson river in full blast. There is a good stage of water in the river and the mills can be run to their full capacity.

News in Brief.

THE snow blockade on the Oregon Railway and Navigation Road still continues.

CONGRESS will be asked to make an appropriation of $100,000 for Yellowstone Park this year.

THE exports of lumber from Burrard inlet, B. C., in 1884, were 29,000,000 feet in forty-four ships.

THE New York elevated railways carried 96,702,620 passengers last year, and had a net profit of $289,697.24.

THE Louisiana sugar planters are feeling very gloomy over the outlook. The result of the season just closed was very disastrous.

THE steamship *Oregon* has again lowered the record, making the passage from New York to Queenstown in six days, six hours and fifty-two minutes.

MINNEAPOLIS millers are selling flour in Canada for less than the price of Canadian wheat, and this has caused large mills at Winnipeg to shut down.

TWO troops of cavalry are on the way to expel Captain Crouch and a party of boomers from Indian Territory. Crouch's men say they will resist the troops.

ADVICES from Kartoum to the end of November state that General Gordon had repulsed several minor attacks, and had food and ammunition for several months.

THE German expedition to explore the African interior has returned to Amburg, Guinea, on the west coast of Africa. The natives refused to allow the expedition to proceed.

THE results of the earthquake in Spain show that it was even more terrible than at first reported. The loss to the town of Malaga exceeds $500,000. Two hundred and twenty-seven houses were damaged.

THE New York *Commercial Bulletin* estimates the loss by fire in the United States and Canada for December at $11,000,000, and for the year at $112,000,000. This is $15,500,000 more than the average loss for the nine years preceding.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if t is continued, through the failure of the subscriber to notify us to discontinue it, or some responsible party requested to stop it, we shall positively demand payment for the time it is sent.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

ASSESSMENT NOTICE.

Fremont Mining and Milling Company.—Location of principal place of business, San Francisco, Cal. Location of works, Amador county, near Drytown, Cal.

NOTICE is hereby given that at a meeting of the Trustees, held on the twenty ninth day of December, 1884, an assessment (No. 1) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourth day of February, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday the twenty-seventh day of February, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Sec'y.

OFFICE No. 402 Front St., Room 8, San Francisco, Cal.

The World's Industrial and Cotton Centennial Exposition

Will be open for Six Months, beginning 16th day of December, 1884.

The display will embrace such a varied and comprehensive collection of the works of nature and art as it is possible for human enterprise to gather.

From the applications already received and entries made, the magnitude of the exhibit will exceed that of any Exposition ever held.

The exhibits of the Departments of the General Government, for which $300,000 was appropriated by Congress, will be the largest and most complete ever made. These exhibits, in conjunction with the State and Territorial Collective Exhibits and Educational display, will occupy the full space of the second largest building of the Exposition—one of the very largest ever erected—885 feet by 565 feet.

The displays in the Horticultural department, in Agriculture and in the Live Stock department, will be of equal, if not greater, magnitude than if separate and distinctive exhibitions were given.

The Mexican and Central American Exhibits will possess unusual interest from their variety, uniqueness and historical value.

In the line of Manufactures and Arts, and in natural products, the Exposition will be memorable—excelling all previous efforts.

The principal structures of the Exposition are:

The Main Building—1,378x905 feet—the largest ever erected. To Machinery Hall, which forms a portion of the Main Building, and is 1,378 feet long by 300 feet wide, an extension of 350x120 feet has been added for the special uses of Factories and Mills' Machinery, making Machinery Hall 1,728 feet long by a width of 300 feet—nearly its whole length.

The U. S. and State Exhibits, 885x565 feet.

The Horticultural Hall, 090 feet long by 191 feet wide, in center.

The Art Gallery, 250x100 feet.

The Mexican National Exhibit, Octagonal, 80 feet cross section.

The Mexican National Headquarters, 300x100.

The Grand Rapids (Mich.) Furniture Pavilion, 172x172 feet.

Saw Mill Buildings, 090 feet long.

Live Stock Quarters and various other minor Buildings.

The Exposition grounds lie between St. Charles Avenue and the left bank of the Mississippi River. They are reached by five different lines of street railways, two of steam, and by all classes of water transportation.

Accommodations for fifty thousand transient people have been listed—rates and character determined and recorded. The prices will range from one to three dollars per day, according to the character of accommodation provided.

Railroad transportation promises to be at much lower rates than ever before secured. The leading lines of the country have already arranged their schedules to this effect, and publication is only delayed in order to have it complete.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES"—By C. H. Aaron—Is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores.

The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is $1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending December 31, 1884, the Board of Directors of the German Savings and Loan Society has declared a dividend on term deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum, and on ordinary deposits at the rate of three and six-tenths (3 6-10) per cent per annum, payable on and after the 2d day of January, 1885. By order

GEO. LETTE, Secretary.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

☞Orders Promptly Executed.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.
Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:
1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.
In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.
To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

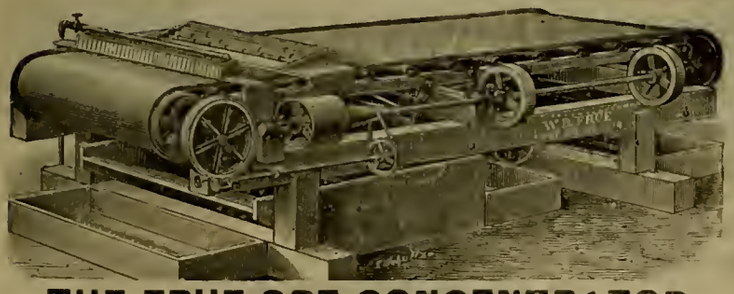
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

SAN FRANCISCO, SATURDAY, JANUARY 17, 1885.

VOLUME XLXX. Number 3.

The Embrey Ore Concentrator.

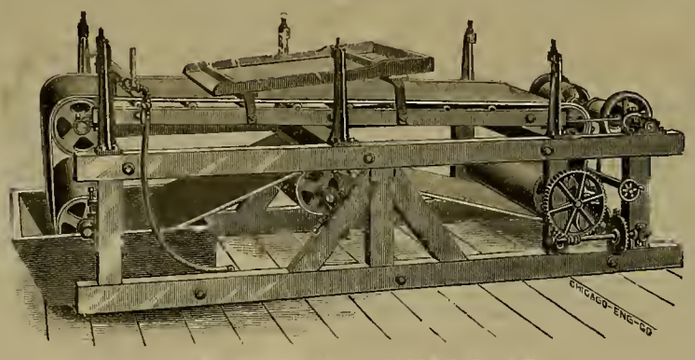
This machine originated in an attempt to obtain something closely resembling the successful Frue Vanner. It was first made known in 1881, and has since been itself imitated in California by a machine which combining the movements of the Embrey with the construction of the Vanner, it is offered as a novel machine, with, of course, vastly increased (?) capabilities.

The Embrey Concentrator has been greatly improved in construction by its present makers, the improvements being based on some ten years' experience in the manufacture of the Vanners. It is made in two forms, one following closely the construction of the Vanner, but with *iron frame* to withstand the increased strain of faster running required with the end shake; the other form is built with a wooden frame, and the driving gear is placed at one end of the machine instead of under the shaking frame. The engravings on this page show the appearance of both forms.

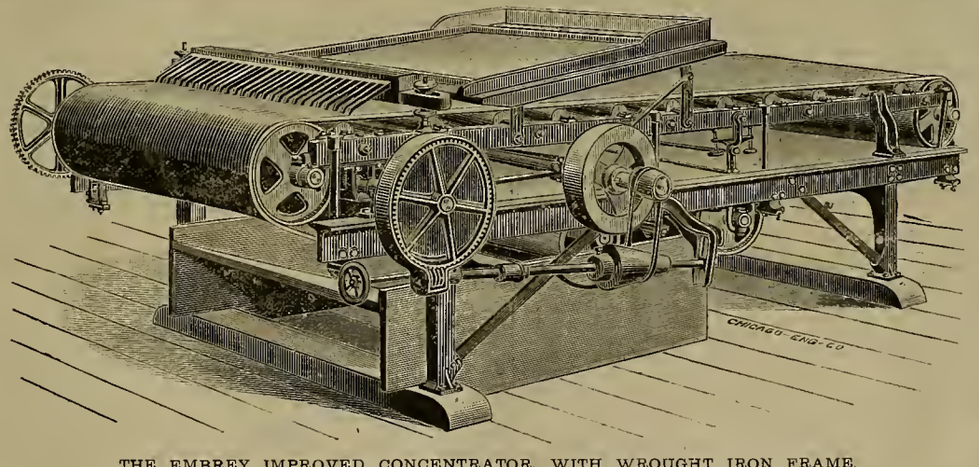
The iron frame machine is neater and more compact in style than the other. The frame is of wrought iron strongly braced, and preferable to castings for transportation, both in weight and freedom from breakage.

The wooden frame machine is, however, much preferable for steady work. The driving gear is not crowded under the moving parts, but it freely within reach while in motion, a great advantage in a quick running machine, with which stoppages are injurious, and regularity of motion imperative. Another great advantage is the reduced moving weight carried by the shaking frame, which is relieved of the two lower rollers, and nearly one-half of the weight of the belt itself. This reduction in moving weight, reduces the power required, and greatly decreases wear and tear.

Both of these machines are supplied with the special rubber belts, so well known on the Frue concentrators, and the durability of which is beyond a doubt. For gold mills, the machines are fitted with a perfect amalgam saving appliance, similiar to those used on the Frue vanners in the Little Annie Mill, Colorado, where there is collected daily by them, from $150 to $200 per day, in amalgam. The public is warned against imitations of this machine. Circulars can be obtained from Messrs. Adams & Carter, 109 California street, San Francisco, or at the office of the Frue Vanning Machine Co., 2, Wall street, New York.



CONCENTRATOR AND WOODEN FRAME.



THE EMBREY IMPROVED CONCENTRATOR, WITH WROUGHT IRON FRAME.

Eastern capitalists are examining the Clark's Fork mines, Montana. The mines so far discovered prospect very high, the major portion of them yielding ore which averages from 40 to 250 ounces. A railroad has been talked of, the ground surveyed, and preparations made for its completion the coming season. The mines are situated but 20 miles from the Yellowstone river, and are easily reached and worked. A tunnel, 300 feet in length, is now being run to tap the main ledge of one of the principal mines, at a depth of 250 feet from the surface.

The Technical Society.

At the last meeting of the Technical Society of the Pacific Coast, vice-president Geo. Specht presided.

Aug. J. Bowie, Jr., read a very interesting paper on "The Destruction of the English Dam," which we shall publish at an early date. The data given by Mr. Bowie on the subject of the flow of a large body of water suddenly released, formed the most interesting and valuable portion of his paper. Maps and drawings were shown to illustrate his remarks.

Mr. Fr. Gutzkow read a paper on "John Reynolds' Process of Bar Refining," showing how the invention of a California workman had revolutionized the process of refining all over the world. We shall publish this paper when it appears in the transactions of the Society.

Mr. Bowie, on behalf of the Committee on Measurement of Water, presented a report recommending that the Legislature be memorialized, or the subject of establishing a unit for the measurement of water in this State, and that suitable experiments be made to establish the unit. The committee was empowered to forward a memorial to the Legislature.

The paper by Mr. Jenssen, read at a previous meeting, on the subject of "The Causes of Explosions in the manufacture of High Explosives," was discussed by the members, the discussion bringing out many valuable facts.

The nominating committee reported the following regular ticket for officers for the ensuing year: president, Col. Geo. H. Mendell; vice-president, Geo. J. Specht; secretary, Chas. G. Yale; treasurer, Geo. W. Percy; Board of Direction, Seth Babson, Fr. Gutzkow, J. D. Schuyler, Aug. J. Bowie, Jr., Geo. W. Dickie.

Text Book of Commercial Law.—A very handy text-book of commercial laws as existing in California, by F. J. Varsault, attorney-at law, has been published by Heald's Business College, of this city. It is designed for use in commercial schools, and by business men. The point of view is that of the merchant and not of the lawyer, therefore, scientific arrangement has given way to simplicity. It gives in plain and simple form those general principles of law as existing in California, a knowledge of which is necessary to every business man. The volume comprises about 120 pages with a carefully arranged index.

At the annual election of the S. F. Stock and Exchange Board, the retiring President, George T. Marye, Jr., sent a communication, in which he stated, that while the palmy days of the Comstock are over, rich developments may be expected, and that at present the indications on the 3,000 level are as good as they were near the surface. He believed that San Francisco is and will remain the center of the mining industry in this country.

The *Sentinel* says that during the year 1884, the Tybo Mining Company shipped bullion valued at $13,000.

An Adjustable Screen for Stamp Batteries.

George Massu and Filomeno Fernandez, of Mazatlan, Mexico, have secured a patent through the Mining and Scientific Press Patent Agency for an improved means for adjusting the screens of mortars for stamp mills, whereby they are adapted to be raised and lowered according to the state of the dies, whether new or worn. The object of the invention is to so arrange the screens that they may be raised for new dies or lowered as the said dies wear out, in order to keep them at a stated or fixed hight above the dies, and that the discharge of the pulp may be effected to the best advantage.

The mortar bed is left open in front for a single-discharge mortar, and open both in front and back for a double-discharge. In the open front of the mortar is left but a toe across it to hold the dies in place. The screen rests on the top edge of a wrought-iron movable or adjustable plate, which is dressed or faced on the planer, as is also the face of the mortar bed.

Both the screen and movable plates are held water-tight against the mortar bed by the following means: First, by two wedges, two angle-irons, and two cast-iron sledges or guides, planed and riveted to the jaws, extending from the mortar and to the housing, which housing may be made either of sheet-iron or cast together with the mortar bed proper. In order to secure the tightening of the wedges equally against the screen and movable plate, the latter is provided with two cast-iron liners, planed and riveted to the plate in order to make up for the difference of thickness between the frame of the screen and the movable plates; second, by three screws fitted with small wheels or spurs. These screws work into a cast-iron cross-piece, held between the projecting jaws of the mortar.

By means of a yoke and screw working through a nut fitted in a bracket, the movable plate and screw can be lowered or raised. The bracket is open in front, and provided with a pin to prevent the yoke from falling off, and the extremities of the legs of the yoke are made to fit into two cast-iron brackets riveted to the movable plate. This plate bears also a small wrought-iron bracket and wedge, to tighten the screw against the plate.

After the screw has been regulated according to the hight of dies, the yoke, nut and bracket can be taken out by removing the above named parts, to be replaced again when a new setting of the screen is required. A trough is riveted to the movable plate, to receive the pulp, which is afterwards delivered to the tanks through a round, cast-iron spout. By means of the screw and yoke the screen can be raised or lowered to suit the state of wear of the dies.

The Hailey *Times* reckons that Wood River has produced eleven millions in bullion the past four years, putting the yield of 1884 at four millions, and estimates the product for 1885 at seven millions.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Notes from Churchill County, Nevada.

Nickel and Cobalt in Paying Quantity—Some Promising Silver Mines.

[From our traveling correspondent.]

Lovelock, on the line of the Central Pacific Railroad, is the shipping point for an interesting mining section, which is just now beginning to attract attention.

The districts lie south and east, dis ant 20 to 40 miles from the station. As yet but little work bas been on the base metal and silver claims. In some cases they are getting ready for thorough prospecting, while in others exploitation is being vigorously carried forward in connection with the extraction of ores for shipment or for reduction on the ground.

The Silver Hill Mining Co..

In Pike Holland District, consisting of Messrs. Allen, Whiteman and others, are interested in several locations, many of them thought to be very encouraging prospects in view of present developments.

The Lady Washington

Is reported to be four feet in width and easily worked, the ore assaying up into the hundreds, but estimated to work at the lowest about $80 per ton in silver as it comes from the ledge. Water is found in abundance and wood is plentiful—large enough for timbering. A mill is now on the ground in process of erection, which will start up when finished.

Messrs. Fergison, Ingraham and Calvert have a location on the same range. They have a two-foot ledge of very rich ore—a test in a small way is said to show a result as high as $600 per ton. It is thought safe to put the average working value of the ore at $180 a ton in silver and lead. Men will be set at work immediately.

The Black Hawk, in I. X. L. district, 35 miles from Lovelock, owned by Mr. Kellog, is represented as a base metal ledge with immense croppings of the ore, that will probably pay $100 per ton. It is understood that smelting works will be put up in the spring.

Cobalt and Nickel Mines.

A discovery of nickel ore was made upwards of 20 years ago in Cottonwood Canyon, Churchill county, about 40 miles east of Lovelock station. At that time little was known here of the metal. No one was found capable of a correct assay or analysis of the ore, to say nothing of the more difficult task of reduction, so that it is only very recently that the value and importance of the find are beginning to be fully realized. The first shipment from one of the mines a few months ago was so very favorable in character as to infuse new life and energy into the whole district.

The London mine, located by Mr. Geo. Lovelock as early as 1861, has lately been incorporated. The stock is now owned by Messrs. Bell, Mason and others, of Oakland, Cal.

The developments are mainly by tunnels, one of 200 feet following the ore and penetrating the mountain to the depth of 100 feet from the surface. There are several parallel veins, varying in width from 6 inches to 3 feet, and from 50 to 100 feet apart. The ore in the veins proper carries 4 per cent cobalt, 20 per cent arsenic and 30 per cent nickel, while the whole of the belt, for 300 feet in width, is said to be vein matter, with from 3 to 4 per cent in nickel and 20 per cent in arsenic. As arsenic brings 15 cents per pound in Birmingham, Eng., nickel about 54 cents and cobalt as high as $1, it is thought that the whole of this ground can be made to pay by concentrating 6 tons into 1 ton of matte before shipping. To this end the company are now preparing to erect a furnace. The British Queen and the Monarch, owned by a Chicago company, and adjoining the London, have had only a small amount of work in the way of development, but show large deposits of ore near the surface, much of it standing up from 600 to 700 feet above the surrounding country.

The Emperor, the President and the Empire, recently bonded by Mr. Geo. Lovelock to Messrs. Keys & Husch, of your city, lie on the same belt, immediately west of the Monarch.

Upwards of 50 tons of ore have been shipped to Liverpool, since the 1st of May last.

It yielded from 10 to 12 per cent in cobalt, 10 per cent in nickel, and 25 per cent in arsenic, which, at the prices above given, must have paid well after deducting expense of shipping and reducing. The whole belt carries fully four per cent and upwards of these metals, and is believed as before stated, to be a paying proposition, if properly concentrated.

The Emperor has a cross-cut of 110 feet, through low-grade ore, and another of 120 feet through 8 feet of fine ore, such as is now being shipped.

The President and the Empire carry ore bodies, giving seven per cent in cobalt, and eight per cent in nickel, from all of which it must be evident that the outlook for this portion of Nevada has never been more flattering.

In addition, many locations are now idle, awaiting cheaper transportation, or better facilities for concentrating the ores for reduction at the mines.

A. C. K.

Lovelock.

The National Silver Convention.

All the State will send delegates to the National Convention of Silver Producers, which meets at Denver, Col., on the 28th inst. Invitations have been sent to the Governors of the silver-producing States. The following is a copy of the invitation to he represented in the Convention.

HEADQUARTERS CLEAR CREEK CO.
SILVER ASS'N., GEORGETOWN, COL.

To His Excellency, Governor ——:

The signers of the call, herewith, for a State and National Silver Convention, who are representative men of different political affiliations, residents in 19 counties in this State, delegated to the undersigned the authority to perform the duties of a State Executive Committee, until our State Convention assembles, and a State organization is perfected.

In this capacity, we respectfully invite your attention to the following call for a State and National Convention, to meet at Denver, Colorado, January 28, 1885, and extend you a cordial invitation to he present on that occasion, and participate in the deliberations. We also through you urgently request the attendance of as many of the friends of silver from your State, as you may appoint, or as may he elected by State or County Conventions, or otherwise, as they may elect. It is earnestly desired that every State and Territory in the United States shall be well represented at the Convention, the entire country being interested either in the production or circulation of silver as money, and united action being necessary for its protection and restoration to its former relative position, as a money metal, with gold.

D. B. HARRIS, Ch'n.
J. M. S. EGAN, Secy.
H. A. MEARS.
C. C. POST.
P. M. HANSBROUGH.

The address on this subject, issued at Georgetown, Col., is as follows:

To the silver producers and all who favor its free and unlimited coinage throughout the United States and Territories.

In the face of abundant agricultural crops throughout the country, the cry is heard from all parts of the United States that times a e hard, confidence is unsettled in financial circles, and money is hoarded by the hanks and individual lenders, instead of circulating among the people. The cause of this is from the fact that an insufficient supply of money exists, and the people are compelled to transact too great a proportion of their business on a credit. Under the existing laws of congress, 25.80 grains of gold, nine-tenths fine, containiug 23.22 grains of pure gold, constitute a dollar, and 412.50 grains of silver nine-tenths fine, containing 371.25 grains of pure silver, constitute a dollar, and the producers or owners of pure gold can take it to the United States mints in unlimited amounts and have it coined into money by paying the cost of the alloy, the expense to the government for getting the coined gold into circulation being only the mintage. While the coinage of silver is limited to not less than $2,000,000, and not to exceed $4,000,000 per month, and instead of coining it on the same footing that gold is coined, the governor purchases it outright and keeps it out of circulation by locking it up in its vaults.

Since the law was enacted, in 1878, limitiug the coinage of silver, its annual production has been from $37,000,000 to $48,000,000 actual value, and the annual coinage about $28,000,000 coin value, or $24,000,000 actual value, after deducting the loss of about 15 per cent, sustained by the producers.

The annual loss to the producers on the entire product of the country aggregates $6,000,000 to $7,000,000 by reason of this unjust legislation against silver, and aside from the loss to the entire people by retarding its production and circulation, the expense sustained by the government is practically about $24,000,000 annually, which would cease, and this amount would be saved to the people, and could he applied to other purposes if individual coinage of silver prevailed as formerly. Besides, with individual coinage the silver would go into circulation from the hands of the producers as fast as it is coined, and the price being advanced its production and coinage would be doubled in a very short period, thereby stimulating all other business enterprises and benefiting the whole people.

The rapidly increasing population and more extended commerce, together with the falling off in the production of gold from year to year, and the constantly increasing amount of gold used in the arts and manufactures, are potent reasons for increasing the coinage and circulation of silver.

The opponents of silver money tell us that to coin money free and unlimited would induce foreign silver to flow to the United States by reason of its enhanced value here, and the foreigners would realize an average profit of 15 cents on the dollar, but they fail to tell us that the coinage of foreign silver would cost the government only the mintage, and being worth more here with the United States stamp upon it than it would be in other countries as bullion, it would remain in circulation in this country.

In 1878 Reuben E. Fenton, W. S. Groesback and Francis A. Walker attended the International Monetary Conference at Paris, France, as commissioners from the United States, and in 1881 Allen G. Thurman, William M. Everts and Timothy O. Howe attended a similar conference at the same place. At both conferences the efforts of the friends of silver availed nothing; the representatives in attendance from monarchical and despotic governments not acceding to the demands of those from France and the United States. Hence we should not longer hope for the recognition of silver by foreign countries by any united action. But the United States, being the largest silver producing country in the world, should take the lead in the matter of coinage, and if the great flow of silver to this country occurs that is claimed by the mono-metalists who are so agitated from fear that the people will prosper, then an import duty might be placed upon it, as is now the case with iron, lead and other metals.

In view of these and numerous other facts the undersigned citizens of Colorado, realizing the impor ance of thorough organization and united action for the protection and advancement of the silver interests of the entire country, hereby call a State convention to meet at Denver Colorado, Wednesday, January 28, 1885, at 2 o'clock P. M. The object of the convention will he to take such action as will influence the two Houses of Congress and the President, to coin silver free and unlimited and restore it to its former relative value with gold, and also to act on any other measures that may properly come before it.

It is important that every county in Colorado shall be fully represented, and the citizens of each county, irrespective of party, are urgently requested to hold conventions at their respective county seats, Saturday evening, January 17, 1885, and elect at least as many delegates to the State Convention as they sent to the Democratic or Republican State Conventions in 1884.

The friends of silver in all the other States and Territories, whether silver producers or not, are earnestly invited to attend this Convention as delegates, or otherwise, where it is not practical to hold conventions and elect delegates, and to participate in its deliberations, thereby merging it into a National Convention.

THE MENACE TO SILVER MINES.—The banking class of people in the Eastern States are exerting their influence through a venal press and certain facile public men of both political parties at Washington to destroy our silver mining industry, by stopping the coinage of silver in the United States Mints. If this is done our mines will become worthless, and it is high time that conventions he called throughout the State of Nevada, for the purpose of memorializing both Houses of Congress to do all that can and should he done to preserve our silver interests and improve rather than demoralize an industry without which this State cannot exist. Our State legislators also must not forget during the present session to take prompt action for the purpose of heading off the rapidlly growing strength of the anti-silver class of traitors in the East.—*Eureka Sentinel.*

GAS ENGINES WORKED BY THE DOWSON GAS.—Messrs. Crossley Brothers, of Manchester, whose new works at Newton Heath are driven throughout hy eight large Otto gas engines, developing about 150-horse power, worked by the Dowson gas, bave taken out returns of the consumption of coal over a period of 35 weeks, with the result that, including the waste on Sundays of about 500 cwt. for keeping the fire of the Dowson producer going, they find the consumption does not exceed 1.3 pounds of coal per horse-power per hour. We may add that Messrs. Crossley have just completed an Otto engine to indicate 90 horse-power, which is the largest gas engine ever made in this country. It is one of the new double-cylinder engines with a very ingenious valve arrangement.—*Colliery Guardian.*

California Quartz Mines.

Although hydraulic mining, says the Grass Valley *Union*, has been placed under a cloud by the litigation against it for the past few years, and unfavorable decisions of the courts, and investment in and development of that character of mining property has virtually ceased, yet the quartz mining industry has been growing apace in California, and to-day stands on a better footing than at any previous time in the history of the State. In saying this we do not overlook the fact that quartz properties once of note have now no standing, and that all over the mining regions are to be found partially developed quartz mines that are idle, or prospect holes that show where money and labor was thrown away. We know that there have been many and costly failures in quartz mining, and from the fact that all quartz veins cannot he prolific gold-bearers, there will be failures in the future; yet experience has been a good teacher, and imparted knowledge where ignorance once existed, and improvements in machinery and a better knowledge of working ores has done much in late years in giving a reliability to quar z mining that it did not possess in earlier years, when there was a general inexperience as to the characteristics of mineral-bearing veins, and a woful lack of knowledge in properly manipulating the ores. Early quartz mining was attended with great expense, and only because of the richness of many veins was it possible to obtain a profit when there was such an absence of skill and economy. Quartz miners have learned, however, that gold-bearing veins are not rich as a rule, but are yet sufficiently reliable, in a majority of cases, to yield a profit, if the same prudence and intelligence is used as is necessary in other trades and industries. This has been so well demonstrated that of late years quartz mining has grown into much larger dimensions than is generally supposed, not through the agency of corporations that figure in the stock markets, but mainly through local or individual enterprise, until there are now in all parts of the mining regions quartz mines that are being worked regularly and with a profit, but whose output is not a matter of publication any more than would be the details of other private business. It is but necessary to point to the fact that quartz mining, which has always been an important business in Nevada county, has grown much in two years, and a number of new enterprises of the kind are now being entered upon. Sierra county, which is ribbed with quartz ledges, long neglected, is coming to the front as one of the richest and most important quartz mining regions in the State. Plumas and Shasta have now profitable quartz mining where a few years ago little was doing. Quartz mining has made substantial anvances in Placer and El Dorado county, and Amador county still holds the second place to Nevada, while in Calaveras and Tuolumne the dead placer camps are taking on new life from the influence of the stamping batteries. In the far South, in the Calico district, a rich and extensive field is being opened, and now from the far North, in Trinity, comes the promise of quartz discoveries of valuable and permaneut character. The growth of quartz mining in the State has not escaped the attention of mining men, and is having the effect of lessening the dispositiou to seeek regions which have their greatest glamour of richness the more distant they may be, and cause them to invest in California mines, which, though not promising such rich returns, yet are found to be reliable if intelligently and economically worked. With the present year there will he a decided advance in the quartz business, and the future output from this source of mining is destined to show a regular and healthful increase.

GRUB STAKE THEM.—Winter has set in, and a number of miners who are out of work are anxious to find shelter through the season. Many a hardy fellow in this camp, although very willing to work that has not succeeded in finding employment, is willing to take chances with the mine owner, could he but secure grub and cabin to live in during the stormy period. Never was the time more propitious for the owners of small mines. Get on to a few worthy fellows, furnish them a cabin and grub through the winter, and give them a liberal share of the ore they discover, and the chances are that by the opening of spring you will have a mine where now you have little better than a hole in the ground to-day.—*Eureka Sentinel.*

CAMPBELL PROCESS.—The Idaho Springs (Col.) *Gazette* says: The Pacific Reduction Company, of this place, who are working the Campbell process, have shipped about a ton and a half of good bullion, which assayed over $400 per ton. This is considered excellent results, when it should be taken into consideration that they have not treated any ore which would assay over 15 or 20 dollars a ton. Perhaps this much abused process will eventually prove a blessing. We hope for its success. Our miners could get a better price for their ores, and it will he the means of making Idaho Springs an important smelting point.

SUPERIOR BLANKETS are now being woven out of cow hair.

MECHANICAL PROGRESS.

The Inventor and the Machinist.

In the production of every machine two talents are brought into requisition—the inventive talent and the mechanical talent. The inventor and machinist may be one and the same person, but it is more frequently the case that the inventor is not a machinist, and the latter not an inventor in the broad acceptation of that term. The skill requisite to plan and devise a machine is of a far different order from that required to fashion its parts and to assemble them. The inventor deals with ideas, with great mechanical principles. His is a work of discovery—a logical proceeding dealing with causes and effects. It is not absolutely necessary that he be able to make a single part of the machine which he invents, although it were better could he do so, and the more familiar he is with the details of mechanical construction, the easier is it for him to accomplish his desired ends. A true inventor reads a machine as he would a book. His eye takes in every part with a glance, and the objects and purposes of the machine are as clear as day to him.

The machinist, on the other hand, may work for weeks on the separate parts of a machine, and yet not know the true principle upon which it is constructed. He may be able to do his own work with skill, which work may be perfectly adapted to the object intended, and may be fashioned and fitted with the utmost accuracy and bear a finish that rivals the best workmanship; and still he may not have a clear conception of the purposes for which it is adapted. We are speaking of machinists whose mechanical skill exceeds their inventive ability. Such machinists are perhaps good workmen, understanding in a general way the ordinary uses and purposes of the articles they make; but when called to exercise their calling in the higher realms of their art, they fall short of understanding the aims of and purposes of the inventor, although they can work with a nicety to his plans. This proposition is more truly correct of the common workman than of the one who is called upon to erect the machine, for the latter must be a poor observer if he is capable of placing all the parts of a machine in correct position and yet does not understand their ultimate operation and use.

The work of the inventor is in the domain of speculative thought. The work of the machinist is, on the other hand, of the most practical character. The latter is the complement of the former. What the one conceives in his mind the other materializes in wood and iron. The inventor carries his speculations into new fields. The machinist follows him in his adventures, and at every step stands ready to execute his designs. Without the latter the inventor would be powerless to accomplish his purposes. It is a useless speculation, the determination of which position is the more valuable, that of the inventor or the machinist, because each is necessary to the other.

The more mechanical skill the inventor possesses the better is he equipped for his work. To be able to make a machine as well as devise it is a double acquirement. In fact, it seems essential that the best inventors should possess a certain degree of mechanical skill. The training necessary to obtain it is highly beneficial in showing him the properties of the material of which his machine will be made, and the difficulties in the way of adapting means to ends in bringing it forth.

The inventor not unfrequently meets with trouble in the machine shop, owing to the fact that the true principle of his invention is not grasped by those attempting to execute his orders. The result is that work has to be undone, delays occur, and the cost of construction is greatly enhanced. The fault is sometimes that of the inventor, who has not sufficient knowledge of shop work to give the proper instructions for producing the exact article desired. In such instances it is a cut-and-try experiment until the desired end is reached.

It is evident that the nearer the inventor approaches perfection in mechanical skill, and the nearer the machinist approaches the position of the inventor, the better for both. This can be done. Study and observation and the best use of particular faculties called in play, either in the workshop or in the inventor's laboratory, will accomplish the result desired. —*Scientific American.*

A CEMENT FOR STEAM ENGINES.—According to Grier, an excellent cement for steam engines is made as follows: Take of sal-ammoniac, two ounces, sublimed sulphur, one ounce, and cast iron filings or fine turnings, one pound. Mix them in a mortar, and keep the powder dry. When it is to be used, mix it with 20 times its quantity of clear iron filings or turnings, and grind the whole in a mortar, then wet it with water until it becomes of convenient consistence, when it is to be applied to the joint. After a time it becomes hard and strong as any other part of the metal. Again, in joining the flanges of iron cylinders or pipes, to withstand the action of boiling water and steam, great inconvenience is often felt by the workman for want of a durable cement. The following will be found to answer: Boiled linseed oil, litharge and white lead, mixed up to a proper consistence, and applied to each side of a piece of flannel, linen, sheet lead, or even pasteboard, and then placed between the pieces before they are brought home, as it is called, or joined. For small joints, India-rubber rings are used with success, and for large ones pure flax rope (soft twist and plaited), steeped in melted tallow. This packing to be always kept tightly screwed between the flanges. Another substance in the market for a similar purpose is asbestos cement.

An Important Discovery.

All who are familiar with the manufacture of very thin sheets of metal, either iron or steel, know the great difficulty there is in picking the scale off, in order to get a fine finished surface. They know the danger of the acid penetrating through the metal and destroying it. It is a difficult thing to do well, and the operation is one that must be done carefully, and is one that everybody that has it to do will be glad to get rid of.

At a recent meeting of the Local Engineers' Society at Pittsburg, William Metcalf read a very interesting paper on natural gas, in the course of which he referred to the above fact, and stated that a gentleman at Leechburg, now applying for a patent on the process in annealing fine sheets, brings the annealing-box to the required heat by use of the natural gas, and then, by a pipe connected into the box, when the metal is hot enough, turns in a stream of the natural gas on to the material, and allows it to pass through, keeping the box hot for some little time, and then allowing it to cool gradually, when the whole mass of sheets come out perfectly clean—as clean as tin, but not as bright, but entirely clean; and, singular to say, though the sheets are very thin and packed closely in heavy boxes, this gas in some way gets to all among them, and they come out perfectly clean and free from scale. This is another application of the gas that will certainly be of great benefit if it proves to be practicable, and there is no reason why it should not be.

THE CHEMIST IN IRON WORKS.—"Ten years ago," said the head of a Pittsburgh iron firm, who had been the expert on all of the recently built bridges of any importance in this country, "there were no more than two or three chemists in Pittsburgh. In 1872 Captain Linnt spoke to James Park, Jr., about having a chemist at his steel works, but that gentleman said that it was unnecessary, as experienced steel-makers could tell what was good or bad steel, but it was not three years until he had three chemists employed at fixed salaries. The trade required it. The first chemist here was Chairman Curry, of the Board of Directors of Carnegie Bros. & Co., who was then at the Lucy furnace. Since then almost every steel company has the regular services of chemists, and it is a very poor concern which does not have one."

STEEL.—The fact is familiar to metallurgists that a steel which is very flexible when cold often breaks at the blue annealing temperature. It has also been generally considered that the purer the iron is the less subject it becomes to this defect. It appears, however, that the workmen of the Ural Mountains, who use iron of remarkable purity, have often observed the same fact. It has also been found on investigation that the metal in question becomes powdery at a temperature between 500° and 700° Fahr., or the temperature at which willow twigs take fire. This phenomenon would seem to explain a large number of accidents, as, for example, the breaking of tires under the action of brakes, and the fracture of riveted molds, and of machine arbors, which become heated by friction, hitherto regarded as unaccountable.

TRUING GRINDSTONES.—Several of our exchanges have suggested the use of a piece of gas pipe for truing a grindstone. The *Scientific American* explains how it should be, as follows: Lay a flat iron bar across the grindstone frame as close to the stone as possible without touching. Take a piece of ¾ gas pipe 2 or 3 feet long, and hold it at about 45°, with the end resting upon the iron plate. Roll the pipe slowly across and against the face of the stone, holding the pipe firmly to its place, so that the stone will bite upon the end of the pipe. The pipe will wear away as well as the stone; rolling it will keep the end even.

NEW PROCESS OF STEEL MANUFACTURE.—A syndicate has been formed for experimenting on and controlling the new process of manufacturing steel to compete with the Bessemer process. The expectation is that it will take the place of forged or rolled iron in the manufacture of different articles. The syndicate is composed of several prominent iron manufacturers, each one of whom has paid in $10,000 to form a pool of over $100,000 to use in perfecting the invention. The patentee claims that he can manufacture steel much cheaper than it is done at present.

WRITING AND LETTERING UPON STEEL.—Steel can be written upon or engraved by first cleaning it with oil and then spreading a coating of melted beeswax upon it. The writing can then be done on the beeswax, with any sharp instrument, and the lines and marks thus made should be painted with a fine brush dipped in a liquid made of one ounce of nitric acid and one-sixth of an ounce of muriatic acid. When the written lines are filled with this liquid, it should be allowed to remain five minutes, and then the article should be dipped in water and afterward cleaned.

SCIENTIFIC PROGRESS.

Firefly Light.

MM. Aubert and R. Dubois have recently made a number of interesting observations on the light emitted by "pyrophores," or fire bearing insects. These pyrophores have three luminous organs, one situated at the ventral part, and two at the superior part of the prothorax. The last are always visible, and were submitted to the tests. The light was produced by rubbing the insect with a light brush, and was examined by means of an ordinary spectroscope with a prism of very refrangible glass and a micrometer. The spectrum was very fine, continuous, and showing neither brilliant nor dark rays. This peculiarity has already been pointed out by Pasteur and Gernez, who studied the light from a pyrophore belonging to the late editor of *Les Mondes*. The spectrum occupied about 75 divisions of the micrometer, and extended on the red side to the middle of the interval which separates the rays A and B of the solar spectrum, and on the blue side a little beyond the ray E. When the intensity of the light varied, its composition changed in a remarkable manner. When the brightness diminished the red and orange disappeared entirely, and the spectrum consisted of green, and a little blue and yellow. The green rays lasted longest. The contrary took place when the light grew in brightness, the green appearing first and the spectrum extending a little on the blue and a great deal on the red side. The least refrangible rays are therefore emitted last.

No other luminous source known appears to behave in like manner. The only case which bears a resemblance is that of sulphate of strontium becoming phosphorescent under the action of light at a growing temperature. As the temperature rises, rays less and less refrangible appear in the spectrum, but at the same time, the less refrangible rays disappear. When the light of the organ begins to appear, the central and forward part only of the organ is luminous. It is only when the light is very bright that the periphery of the organ is luminous, and then the red rays are visible. The light was found to give photographic images on a gelatino-bromide plate; the insect being two centimeters from the plate, and the time of exposure reduced from an hour to five minutes. The photographs show that the light of the pyrophore is capable of producing intense chemical effects, if the smallness of the quantity emitted be taken into account. The light also determines the phosphorescence of sulphate of calcium, after an exposure of five minutes; and cosine and szotate of uranium are rendered fluorescent by it.

Automatic Arctic Exploration.

The Chicago *Current* says: Probably the most wonderful thing in connection with the whole sad history of Arctic exploration is the recent discovery of an ice floe in the waters of Davis' strait—west of Greenland—which had drifted from a point in the Arctic ocean northeast of the Lena delta—where the crew of the Jeanette divided into three parties and took to the open waters—to the southernmost point of Greenland, and north again to Baffin's bay. Upon this floe were a corpse and many indubitable relics of the expedition, including an article of wearing apparel marked with the name of Seaman Noros, who, it will be remembered, in company with Seaman Nindermann went a few miles ahead of poor De Long, and lived to write the most extraordinary experience ever penned by a human hand. Had these two simple seamen been able to tell, in the Siberian tongue, that their comrades were only 11 miles back, the whole De Long party would have lived to join M[illegible] and Danenhower.

The floe discovered by the Greenlanders possibly crossed directly over the North Pole. From the Jeannette floe to the southern point of Greenland, in a direct line across the Pole, is 3,500 miles, but by way of the northern shore of Asia and Europe—past Cape Northeast, Nova Zembla, Spitzbergen and Iceland and north again into Baffin's bay—would be a distance of at least 6,000 miles. Scientifically, the life of a moving ice floe for so many years, and its migration from one side of the world to the other, ought to furnish suggestions and data more valuable than all the other fruits of polar research combined. Self-registering meteorological apparatus, and possible gauges of the miles traveled may, in the future, reveal to the investigators what the sacrifice of thousands of lives have otherwise failed to discover.

A THEORY AS TO THE ORIGIN OF THE DIAMOND.—Mr. W. H. Huddleston has recently advanced an extraordinary theory to account for the origin of the diamonds of South Africa. As is well known, the diamonds occur in a sort of soft, earth breccia, made up of fragments of many kinds of rock and evidently of comparatively recent origin. A great part of the pebbles consist of basalt and other igneous rocks. Pieces of coally matter and fossil shells also occur in the diamantiferous breccia, the matrix of which is a soft hydrated silicate. Dykes of volcanic rocks form the walls of the diamond-bearing formation. The author maintains that it is certain that the whole matrix flowed upward, and that it is impossible to doubt the eruptive character of the diamond rock. He thinks that super-heated steam was the eruptive agent and suggests the analogy of mud volcanoes. Since no diamonds have been found except in this soft breccia, he suggests that they were formed in the breccia itself at a considerable depth and then carried upward. The carbon is supposed to have been driven from certain carbonaceous shales, which were distilled under enormous pressure, when the carbon had no choice but to assume the crystalline form. Unfortunately this latest theory cannot be applied to any other diamond field.

The Type Writer in Telegraphy.

At the International Electrical Exhibition in Philadelphia, we saw an operator, says the editor of the *Electrical World*, Mr. James W. Sullivan receiving from a Morse sounder, at a fair rate of speed, and copying the messages in beautiful style on a type-writing machine. The sounds from the Remington and the sounder did not appear to interfere with each other, and the operator seemed to receive with much more ease than with pen or pencil, while the copy was as clean, neat and plain, as though it came from the printing press. Mr. Sullivan pointed out a boy in the department, in which he was working, who, though not a telegraph operator, could print 75 words a minute in fine style from dictation.

The thought occurred to us that any company which desired to make the best use of its wires, and at the same time earn a reputation for neatness and speed, might do so in this way. We can point out an old, almost forgotten system of sound telegraphy (Morse code), by which very near or quite 75 words per minute can be transmitted over a single wire. An expert sound reader might thus, with a type-writer, turn out messages in excellent shape—in fact, in the clearest and cleanest of print—at double the speed now usually attained. One of these considerations alone would prove a great boon to that portion of the general public, not apt in deciphering the hieroglyphics now frequently turned out as "messages."

The combined telegraph operator, stenographer and type-writer is, we think, one of the bright rifts in the dark clouds of operatorial life. The rapidity with which the type-writer is now superseding all other forms of copying is not less remarkable than the increasing dexterity of its manipulators; and the proposition stands, that if the speed of a Morse circuit can be raised to match the speed of a first-class "writer" (say, to send and receive 75 words easily per minute), the service will have been improved.

New Alcoholic Ferment.

At Busalla, in the north of Italy, there is a small brewery which has gained a considerable reputation for its beers brewed on the low fermentation system. Last season these beers were very inferior, and without any apparent reason. A local chemist, M. Mendes, was called in to investigate the matter, and the result of his researches was the discovery of what is believed to be a new form of ferment. Among the cells of ordinary Saccharomyces cerevisiæ were some of Saccharomyces Pastorianus, and some other cells very much smaller in size. These latter were isolated and cultivated by themselves, and were then found to be almost spherical in shape, and from 1-300 to 1-500 of a millimeter in diameter. The shape, size and general appearance of the cells of this ferment were found to be very constant, and they very closely resembled those represented on the right hand of the plate iii in Pasteur's "Etudes de la Biere."

So far there would be nothing very remarkable in the identification of a new form of ferment, but M. Mendes by some carefully conducted experiments has proved that this ferment is altogether without action on cane sugar. It is generally admitted that ordinary yeast is not capable of directly fermenting cane sugar, but that it first exerts an inversive action on cane sugar, and after this inversion fermentation takes place. Now the peculiarity of the new ferment discovered by M. Mendes is not that it will not ferment cane sugar, *but that it will not invert it.* Experiments were made with this new ferment on impure cane sugar solutions, and the result was said to be that the glucose and invert sugar were fermented by it, but the cane sugar was left untouched. The practical importance of this discovery to sugar refiners must therefore be very great, and it is at the same time of very considerable interest to brewers.—*Scientific American.*

ELECTRICAL HYPOTHESIS OF FLAME.—Large furnaces must apparently replace small ones. Mr. F. Siemens has proved that solid substances interfere with the formation of flame, and that flame injures solid substances with which it comes in contact. To account for the phenomena he advances, preferably, an electrical hypothesis. Accordingly, he explains flame as the result of an infinite number of exceedingly minute electrical flashes, the flashes being due to the very swift motion of gaseous particles, and a solid body which opposes itself to these flashes is cut by them, while, the motion being more or less arrested by the solid body, the flame is damped. Mr. Siemens insists, therefore, that flame must not be allowed to impinge upon bodies to be heated, but must simply heat the bodies by radiation, and furnaces must be so constructed as to allow the flame to develop out of contact not only with the substance on its bed, but with the walls and roof of the furnace itself.

Passing Events.

For the past two weeks miners everywhere have been engaged in doing assessment work on old claims or development work on newly-located ones. A great deal of mining ground has changed hands under the operation of the laws. As is usually the case, the work being done will no doubt prove many of the locations to be worth working steadily.

The Legislature is in session at Sacramento, but very little business has so far been done. The deadlock in the Senate and its failure to organize has delayed matters greatly.

All over the coast there is now a summing up of the results of last year's work in the mines. In our next issue we shall give a very elaborate review of the mining field on this coast, with statistics of production of the different camps.

There are signs of a general revival of gold mining all over the country, a matter of great interest to California, which has more extensive gold fields than all other States and Territories combined.

AN important discovery of rice silver ore has just been made made about five miles from the Oro Grande mill, on the Mojave river. The discovery was made by Messrs. H. A. Newman, Ralph Shelton and A. M. Hathaway, all of Santa Ana. The ore is a smelting ore as far down as the shaft has been sunk, about 60 feet, and contains an abundance of native silver and the richest of bromides.

Cable Railway Curves.

An important patent suit has been on trial in the U. S. Circuit Court, which has been of great interest to the cable railway companies. It was the case of Aiken Haman *vs.* the Sutter St. Cable Railway Co. This suit was brought for alleged infringement of a patent granted to Aiken Haman for improvements in cable railways, dated October 3, 1883, No. 287,377.

The particular features of this patent which are claimed to have been infringed, are the bracket piece on the lower part of the grip carrying a guide roller and a curved bar or rail within the tube, against which this guide roller acts in passing round a curve so as to prevent the grip from coming in contact with the horizontal pulleys which guide the cable and also to relieve that portion of the grip shank which passes into the tube through the slot from undue strain, laterally, when going round a curve.

In the Sutter street road where it passes from Polk to Post and from Post to Larkin streets there are curves to pass and a guide rail is placed in the tube above the horizontal pulleys, and against this the lower part of the grip slides; a wearing piece being fastened to the grip, and a roller not not being used to relieve the friction of the surfaces; the wearing piece and the guide rail being occasionally lubricated with a heavy oil.

The defense relied upon the patent granted to A. E. Hovey, 176,136, April 18, 1876. Patent to Charles M. Chuse, No. 235,127, Dec. 7, 1880, and English patent No. 5107 of 1879, granted to A. S. Hallidie, as anticipating the patent to Haman which was dated Oct. 3, 1883.

In his charge to the jury on Saturday last, Judge Sawyer said that no evidence had been presented beyond these three patents, which would show that this invention of Haman's had ever before been used, so that it would not be necessary for the jury to consider any evidence outside of these three patents, as to the plaintiff being anticipated. The dates of these patents being established and testimony given as to their identity with that of plaintiff, it belonged to the jury to decide the facts. Should this be decided in favor of defendant, or that these patents were the same or covered the claims of plaintiff's patent, then the evidence of plaintiff to establish priority of invention on his part should be considered. This evidence was to the effect that Haman had perfected his invention before the date of either of the three patents mentioned had been granted. Evidence had been introduced by defendant to show that plaintiff had seen and examined models of grips and tubes before he made claim to this invention, and that the idea was not his own. That in his proceedings in the Patent Office his specifications had been examined—his claims several times rejected—amended, and that at last he had inserted the claims which had been allowed. But that these claims which had been allowed, and upon which suit has been brought, was not the invention upon which the application had been based, and that also they were of a later date than those of the patents which had been introduced by defendant as anticipating the plaintiff's claims.

If the jury were satisfied that the plaintiff had, before the date of the opposing patent exercised invention, and had perfected his invention, and had not used mere mechanical skill or judgment, although he may have seen the model and patents above alluded to, then they should find for plaintiff. That is, if in the plaintiff's patent he had produced such a device, or combination of devices, as would not have been done through mere mechanical skill by one who had seen the other patents, then they should find for plaintiff. Should the findings be for plaintiff, then the question of damages would be determined, and that amount would be the value of plaintiff's improvement over any other which was available and known to defendant, and could have been used by them instead of that of plaintiff.

No decision was reached, for the jury, after having been out about 24 hours, failed to agree, and were discharged.

FROM a report of the sub-treasurer, it appears that there is $1,217,500 more gold coin in California than there was a year ago. This statement, of course, assumes that what has been carried out of the State by private hands has been offset by receipts in the same way.

Our California Northwest.

The Original Gold Bluff—Hydraulic Mining on the Klamath—Primitive Methods and an Independent People.

A good deal having been published of late relative to the mines and mining matters in the northwestern part of California, much public interest has been awakened on that subject. From a party long resident in and recently arrived from that section of the State, we gather the following information in regard to its mineral resources and what seem to be the condition and prospects of the mining industry there at present. Washing the auriferous sands on the beach at

The Original Gold Bluff

Appears to be still carried on there, being practiced after the manner first introduced in 1851, when this notable locality was discovered, and steadily pursued ever since. The beach here, or at least the more prolific portion of it, is owned by two parties in about equal proportion, the southern half belonging to Greenbaum & Co., of San Francisco, and the northern to Edson Adams, the well-known Oakland capitalist. These parties keep each a small company of men on the ground, who, at the occurrence of the first low tide after a storm, the wind being in the right direction, hurry a train of pack animals down to low-water mark, and gathering with all possible expedition the rich streak of sand thrown up by the surf, pack it to higher ground, where it is afterwards washed in sluices. Although the product of gold here could, by adding to the working force, be correspondingly increased, the owners of these properties have been so well satisfied with their earnings that they have not sought to enlarge them by recourse to the simple process here suggested. So far as the northerly half of the beach is concerned, the present owner bought it as a permanent investment, and, being content with the large interest the purchase money returns, does not care to exhaust the deposits by any more rapid method of working. That the investment is a good one may be inferred from the fact that the owner has been repeatedly offered $350,000 for the property, the price he paid for it six years ago being $35,000.

Not only does the beach here pay well for working in the manner described, but the bluff that overlooks it being also rich in gold, could be profitably washed by the hydraulic process. But the two companies named, who own it, also have never done more than wash enough of the gravel to prove its great value, the bulk of it prospecting at the rate of 50 cents per cubic yard. A ditch for bringing water on this bluff would, as compared with those over on the Klamath, be rather long, the nearest source of large water supply being 30 miles distant. But as the cost of such a ditch would not be large, and the bluff, being composed mostly of sand, could be easily run off, there is little doubt but hydraulic operations will some day be inaugurated and successfully carried on here.

Leaving this historic landmark and proceeding easterly, a day's travel brings us to

The Klamath River,

Along which placer mining is still being actively pursued, this being one of the few streams in the State that continues to pay more than average wages. While other branches of the business are carried on here, most of the gold produced is taken out by the hydraulic style of washing, which, however, is, as a general thing, conducted in a very inefficient way and after the most primitive methods. The section of the river which constitutes the principal site of this class of operations, beginning a little below Orleans Bar, extends up stream for a distance of 70 miles or more. Along this stretch high banks and low bars of rich gravel occurring at short intervals flank the river on either hand, the tall and heavily timbered mountains standing directly over them. Down the sides of these mountains flow innumerable streams of water, many of them of large size and nearly all perennial.

Backward in Everything.

While there are a great many different companies at work here, there is not along these 70 miles of the river a dozen No. 2 giants to be seen. Nearly all are, in fact, No. 1, the smallest size. The sluices are everywhere short, while undercurrents are hardly known and quicksilver is in many cases wholly dispensed with. To the miner accustomed to the powerful apparatus and the effective gold-saving appliances in use in the more central hydraulic districts a statement like the above would seem incredible. Yet so it is; these Klamath miners, as regards improvements, are fully 20 years behind the age. Not that they are ignorant of these improvements, for they know all about them; but, being able to make good wages employing their imperfect implements, and adhering to their old ways, they prefer not to bother themselves about anything better. The indisposition of these dwellers on the Klamath to encourage innovations of any kind is well illustrated by the manner in which they suffer goods to be still packed in from Humboldt Bay and other distant points on the backs of animals, though wagon roads could easily be constructed over these routes.

A Look at Things as They Are.

To show that we do these northern people no injustice, let us, starting near the lower end of the hydraulic range, take a run up the Klamath and see what a few of the more representative companies are doing, and what sort of plant they make use of. There are a great many small companies at work along the river below Orleans Bar; but, commencing at that point, we have what is known as the Brown claim, located on the second bench half a mile back from the river, the old Orleans Bar being between them, but lying too low to be worked by the hydraulic process. The Brown claim employs four men, runs a No. 2, giant an average of three and a half months in the year, and yields between $5000 and $6000 per season. This production sufficing to pay hired labor and maintain the owner for the balance of the year, there exists, of course, no necessity for seeking to increase it, though a few thousand dollars expended in bringing on more water and providing better apparatus would enlarge the revenues by three or four hundred per cent.

Passing the claims of the Wilder Brothers, situated on opposite sides of the river a little above Orleans Bar, and both paying well, we come to the Perch ground, where, by reason of better water supply, the working season reaches what is here the extraordinary length of four and a half months. This claim, like the two last mentioned, makes use of only one small giant, though the stock of gravel in all of them and the water within easy reach, would, if availed of, give employment to two large sized giants on each. Proceeding up stream by the claims of Markison & Co. and Halverson & Co., both German, and by half a dozen other mines, the whole of them running No. 1 or 2 giants, whereas they ought to be running No. 6 or 8, we reach

The Old Rood Property,

One of the best on the river, and now owned by Allen Heald, who having had his schooling in the live districts further south, has planned and is about to make such improvements as will increase the past product of the mine many fold, raising it from $1000 per month to $8000 or $9000 at least. This ground worked in a limited way has made a fine record. The patented claim covers an area of 65 acres besides 160 acres secured by location. Nearly the whole of this land consists of rich gravel ranging from 10 to 100 feet in depth. What is required here is a new ditch, not over two miles long and improved washing apparatus. These supplied and the property will be capable of making net monthly earnings varying from $4000 to $5000 for nine months in the year.

Skipping again many small claims, we strike Cottage Grove, for many years a prosperous camp, though its resources have never been more than partially developed. Passing on, we come to Bunker Hill, another thrifty hydraulic locality, the principal claim here having once been owned and successfully operated by William Raymond—he of Raymond & Ely fame. Two giants are now being run on this property, and Temple, the owner, seems to be making money. Seven hundred inches of water are brought in here through a ditch five miles long—a rather long ditch for that region of country.

Taking now a long stride, passing the Wingate ground, with a two-mile ditch and one small giant, and several others equipped in much the same way, we come to the

Happy Camp Hydraulic Property,

Formerly owned by Horace Gasquet, who not long since sold it for a large sum to a New

York Company. The ground, which is rich, extensive and well fitted up, is supplied with 2,000 inches of water brought in from Indian creek through an 18-mile ditch, the longest on the Klamath, if not in Siskiyou county. This ground has always netted the owners large profits. In the early day it also was owned by Raymond who cleaned up out of this and the Bunker Hill ground over $100,000—but he was not a man of the Rip Van Winkle stripe.

Two miles above the Happy Camp claim is situated

The Del Norte Mine,

Owned and managed by S. S. Richardson, who during the past 15 years has taken from it about $500,000; this being over and above the considerable sums purloined by the Chinamen, who for several years past have been working it on shares. Here is another of the long ditches of this country, the water being brought a distance of ten miles. There is ground enough here to last for 50 years, yielding a gross product of $65 000 per annum.

Between Richardson's place and the mouth of Scott river, 30 miles further up, a number of claims are being worked, the most of them in a small way, and after the inefficient manner so characteristic of mining on the Klamath, which in the light of modern inventions and California progress is really an institution of the Dark Ages.

From the foregoing it will be seen that there exists here along this great river of the Northwest

A Most Eligible Field for Hydraulic Mining,

The gravel deposits being not only rich and extensive, but well situated for cheap and effective working. They are free, it is said, from any superincumbent volcanic or other barren matter, except a stratum of loose soil; contain but little pipe clay, and no indurated cement, though the underlying channels abound with huge boulders, indicating them to have been swept, at some former time, by large and swift flowing rivers. The most of the gravel banks are sufficiently elevated above the Klamath, to afford ample outlet; nor can the tailings, after being discharged into that stream, ever accumulate below the dump to a troublesome extent, as the strong and rapid current, during the stages of high water carries them clean away. But while this is the case, these slums cause no annoyance or injury to any interest or property below. The debris question can never come up here, for the reason, that there are no farming lands further down along the Klamath to be damaged by this waste material, nor are there any navigable waters, bars or harbors, to be shoaled by it. Short and inexpensive ditches serve to bring the water, everywhere abundant, and deliver it on the mines. Properties, water franchises included, are cheap, the working season is long, it being possible to run here, where the water holds out, the entire year through. The gravel washed here, is said to yield three times as much as in the more central counties, the net profits realized after ground is opened and outfitted, varying from 40 to 60 per cent of gross production made. In short, the conditions for the prosecution of hydraulic mining, would on the Klamath seem to be of the most favorable kind, and, while we do not say that failures, through ill advised investments or injudicious management, might not occur in this region, we think it may safely be referred to as one worthy the attention of capitalists and others disposed to invest money in the business of gold mining. Of course no one is going to embark his means, either here or elsewhere, without having first carefully examined the field, and we know of none more inviting, to which the trained miner or expert can be sent, than this.

RECENT discoveries of mineral wealth show that the section of the country between Los Angeles and the Colorado river has not been thoroughly prospected. In fact, it is evident that Idaho, Arizona and Nevada have been more carefully prospected for minerals than the great mineral regions in Southern California, within 50 or 100 miles of Los Angeles. The development of the mineral wealth of Southern California has but just begun.

The San Francisco Stock and Exchange Board is in good financial condition, notwithstanding the depression in the mining stock business. It owes nothing, and is more or less directly the sole beneficiary of property worth $425,000, at a low estimate.

The Discovery of Gold in California.

Two days after the date of this number of the MINING AND SCIENTIFIC PRESS occurs the anniversary of the discovery of gold in California. It was on January 19, 1848, that James W. Marshall found the gold in the tail-race of Sutter's mill, that turned the attention of the civilized world to the gold fields of California.

It is fitting that on this anniversary of an occasion which was the foundation of the mining industry of the Pacific Coast—for the development of other regions was the direct result of the working of the California mines some mention should be made of the circumstances of the "find," of the discoverer and of the locality. Through the courtesy of the Sacramento *Bee* we are enabled to give portraits of James

JAMES W. MARSHALL,
The Discoverer of Gold.

GEN. JOHN A. SUTTER.

SUTTER'S FORT, SACRAMENTO, 1847.

SUTTER'S FORT, SACRAMENTO, 1884.

[FROM THE SACRAMENTO "BEE."]

W. Marshall, the discoverer of gold, and General John A. Sutter, who owned the famous mill; also representations of the old fort as it appeared in 1847, and as it looks now. On next page is a good view of the historic mill itself the drawing of which was made by Charles Nahl, in early days. Mr. Marshall was born in Hope Township, Hunterdon county, New Jersey, in 1812. His trade in early life was that of a coach and wagon builder. After living in Indiana, Illinois and Kansas, he came to California, arriving at Cache creek, 40 miles from where Sacramento now stands, in June, 1845. He shortly after went to work for General Sutter at Sutter's fort. He joined the volunteers in the famous Bear Flag war, and after the discharge, returned to Sutter's Fort. Finally he and Sutter decided to go into the lumbering business as partners, and located their saw-mill at Coloma, El Dorado county, beginning the building of the mill in August, 1847.

It was on January 19, 1848, while superintending the building of the mill race that he found the gold. After shutting off the water at the head of the race, he walked down the ditch to see what sand and gravel had been removed during the previous night. He strolled to the lower end of the race and stood looking down at the mass of debris. At this juncture his eye caught sight of something that lay lodged in a crevice on a riffle of soft granite. He stooped and picked up the substance. It was heavy, of a peculiar color, and different from anything he had seen in the stream before. He reflected as to what kind of mineral the specimen could be, and finally concluded that it was either mica, sulphurets of copper —or gold! It was too heavy for mica, was not brittle, as are sulphurets; and, remembering that gold is malleable, he placed the nugget on a flat stone and began striking it with another. The substance did not crack or flake off, but simply flattened under the blows, and Marshall was satisfied that he had indeed made an important discovery.

In a few days he collected several ounces and took them to Sutter's Fort, where it was finally decided that the metal was gold. The news spread and it was not long until the famous "California gold excitement," so big with results to the whole world, began.

In some records the date of discovery is given as January 18th, but the writer, in an interview with Mr. Marshall a few months since, was assured by him that the 19th was the correct date. Marshall is now a poor man, and has been represented as having been persecuted rather than otherwise, which, however, has not been the case. He has really been a privileged character wherever he has been. He lived at Coloma until about ten years ago, and then disposed of his vineyard and went to Kelsey's diggings, where he lived in a cabin five or six years. Since then he has lived in San Francisco, Sacramento, Amador county, etc., having no fixed abiding place. The portrait which is here given is an excellent one of Mr. Marshall, who may be considered one of California's principal historical personages.

General John A. Sutter, who died in Washington, D. C., June 18, 1880, was born March 1, 1803, in the Grand Duchy of Baden. He came to the United States in July, 1834, and settled in Missouri. In April, 1838, he joined a trapping expedition to the Rocky mountains, and came to Fort Vancouver, on the Columbia river. Thence he went to the Sandwich Islands, staying there for five months, when he shipped as supercargo on a vessel bound to Sitka, Alaska. Gales drove the vessel into San Francisco bay in distress, and on July 2, 1839, the craft anchored off Yerba Buena, the site of San Francisco. The vessel had to go immediately to Monterey, the port of entry. Receiving permission to settle in California, he came to San Francisco, and spent some days in finding the mouth of the Sacramento. After some exploration of the rivers, he settled on the spot where the fort was afterwards built. He devoted himself to agriculture and became wealthy. He was declared a Mexican citizen and given a grant of land under the name of New Helvetia, and soon after built Sutter's fort.

On the discovery of gold his workmen all deserted, and it was not long before he was a poor man. He endeavored to obtain redress from Congress for depredations committed on his lands and stocks, but was not successful. General Sutter was a generous man. His manners were polished, and the impression he made on every one was favorable. In figure he was of medium hight, rather stout, but well made. His head was round, features regular, with smiling and agreeable expression, while his complexion was healthy and roseate. He wore his hair cut close, and his moustache short, *a la militaire*. He dressed very neatly in frock coat, pantaloons and cap of blue.

The old fort which bore Sutter's name was built in 1849. The ruins are yet to be seen near L street, between Twenty-seventh and Twenty-eighth streets, Sacramento City. The structure was a parallelogram in form, about 500 feet in length and 150 in breadth, with two bastions. In the middle of the square was a building two stories in hight and containing four rooms. The walls about the enclosure were ten feet high, having a turret with embrasures and loop holes for firearms. Against the walls on the side were built the storerooms of the establishment, blacksmith shop, granaries, etc. At the principal gateway was at all times stationed an armed sentinel.

Academy of Sciences.

At the annual meeting of the California Academy of Sciences, on recommendation of the Council, E. F. Lorquin and Mrs. Mary K. Curran were elected honorary life members, for services rendered to the academy. Prof. Pier-Andreas Sarcardo, of Padua, Italy, was elected an honorary member; and J. H. Smythe a resident member.

The secretary reported that during the past year 21 new members had joined, and two resigned. There are now 127 life members, and 183 resident, a total of 310 members. He also reported that another bulletin is now in press, and other material is being prepared for publication.

The treasurer reported the receipts for the year as $8,678.44, and disbursements $8,210.35; balance on hand, $468.09.

The librarian reported that 860 books had been added to the library during the year.

The corresponding secretary called attention in his report to the necessity of increasing the facilities for exchanges.

The curator of the herbarium presented a report of the department under his charge, which is now in good condition, many new species having lately been added.

The Director of the museum gave a summary of the work done in the different departments of the museum during the year.

The Board of Directors presented a full report of the business affairs of the Academy for the year.

At the annual election, the following officers were elected to serve during the ensuing year:

President, George Davidson; 1st vice-president, H. W. Harkness; 2d vice-president, H. Herman Behr; cor. secretary, Samuel B. Christy; recording secretary, Chas. G. Yale; treasurer, Elisha Brooks; librarian, Charles Troyer; director of museum, W. G. W. Harford. Board of trustees—George E. Gray, Thomas P. Madden, Ralph C. Harrison, James M. McDonald, Louis Gerstle, C. F. Crocker, R. W. Simpson.

THE suit of Carl Schruintzer et al vs. Wangenheim, Sternheim & Co., has been filed in the United States Circuit Court. The suit is brought to recover $500 for an alleged infringement on a patent for the mitrailleuse lamp-burners.

Electric Lighting of Mines.

A correspondent of the London *Mining Journal* says: The annual output of coal in the British Islands may be taken roundly at 170,000,000 tons, which distributed becomes the great sources of heat, light and power, and an increment that cannot be estimated in the sum of human happiness. At the beginning of the present century a large proportion of the coal required was worked from pits near the outcrop, the mining of which was easy and beset with fewer dangers than surround the production of the vast quantity that is demanded by the markets of to-day. A great change has come over the miners' art, pits are sunk to depths of from 2,000 to 3,000 feet, in consequent of which the working collier is exposed to dangers in some respects unknown in the past. One notable point of difference arises from the fact that at least three-fourths of the quantity of coal now raised must of necessity be worked by the aid of safety-lamps. It is not a little curious to reflect than the propulsion of our huge ships the rapid locomotive, and the thousand and one mechanical wonders that meet our gaze on every side depend for the foot pounds generated on the invention of Sir Humphrey Davy, and that without his lamp the treasures of the earth were sealed and beyond our reach.

The Davy lamp at present (with some modifications) is the ordinary means of giving light to the coal miner, for whether we examine the invention of Stephenson, Clanny, or the many busy brains that have been engaged in perfecting the beautiful discovery of Davy, it must be acknowledged that the cylindrical wire gauze surrounding an ordinary oil lamp flame remains the safety-lamp of to-day. For many years after the introduction of the Davy it was considered by the working miner that he possessed a means of insuring absolute safety from explosion; indeed, many of the most prominent mine managers shared in the delusion. This feeling of security that had taken hold of the mining world was somewhat rudely dispelled some 20 years ago by an explosion that took place in one of the best managed and ventilated collieries in the North of England. At the official inquiry into the probable cause of the accident one of the witnesses gave it as his opinion that the explosion arose from the ventilating current becoming overcharged with inflammable gas, owing to the accidental holing into some old workings, and that the velocity of the current had caused the explosion within the lamp to pass through the meshes of the gauze, and so explode the external mixture. This opinion was not shared by the other scientific witnesses, but it led indirectly to a series of experiments, which conclusively proved that every description of lamp in use in the district exploded when exposed to velocities that did not exceed the current in question.

It need scarcely be added that the result of these experiments, which were elaborate and carried out with every attention to scientific detail, had the immediate effect of inducing many of the most promising mining engineers of the day to devote an amount of attention to the subject that was probably without parallel from the time when the old flint mill was displaced by the invention of Davy and Stephenson. All the experiments and improvements were made upon the existing types, and it ought not to be a matter of surprise that nothing original or strikingly novel was the outcome. The first departure from the old style of lamp was made by two French engineers, who constructed an electric lamp, the light of which was enclosed in a glass tube. This was the subject of many experiments in the county of Durham; and, although the illuminating power was equal to the lamps in use, yet the surface exposed by the tubes and the size of the detatched battery were considered insuperable objections to its introduction into general use. Since this invention was tried in England, every advance has been on the old lines; and, although much has been accomplished, yet the method of lighting our collieries cannot be considered satisfactory. If, however, we turn our attention to what is being accomplished by our lively and versatile Gallic neighbors, we find that, by continual and untiring experiments, that an electric lamp has been invented that bids fair not only to revolutionize the existing system of lighting mines, but is so simple in construction and so easily manipulated, that it is likely to supersede the existing type of railway lamp, and will prove invaluable for use on shipboard, as well as an elegant and brilliant mode of lighting our households.

As a mining lamp it seems to fulfill all the conditions requisite for yielding a bright and powerful light with perfect safety. In weight it is about that of an ordinary Clanny, it contains its own battery, it gives off the light of several oil lamps, is simple in construction, portable, economical, costing about a farthing an hour, is quite safe in all mixtures of gas and air, gives off no sparks, the light being incandescent, and consequently in vacuo it requires no more skill in management than a Stephenson; the intensity of its light is easily regulated, and its cost about that of the common Clanny. We shall hail with pleasure the introduction of this lamp into the mines of Great Britain, feeling assured that the increase of light and safety will guarantee its speedy adoption.

A New Dam.

In the last number of the PRESS, in the "Mining Summary" under the the head of Fresno county, was given a short item relative to the new ditch of the Quartz Mountain mining company. The following is a description of the new dam for controlling the water from which the ditch is supplied:

The dam on the north side of the San Joaquin at the foot of Crane valley is a massive and substantial structure, built of logs and stone. The river at the point selected for the dam is walled in by abrupt granite bluffs on either side, the bed of the stream measures 60 feet, the banks or bluffs receding at an angle of about 30 degrees, and the bottom being solid granite. The first timber placed in position is laid crosswise the river, is 80 feet in length and an average diameter of 20 inches, a recess in the rock in both banks being blasted out for the ends of the timber to rest in, and the log fitted closely to the bottom and bolted to the solid rock with iron bolts one and a half inches in diameter. On this log at intervals of 10 feet, are placed logs of similar size, 20 feet long, with the large end fitted and bolted to the foundation log, the smaller end projecting up stream at right angles and likewise being bolted to the bed of the stream. Three similar logs are placed across the stream, being fitted to and resting on the 20-logs, leaving spaces of 10 feet between, thus forming the bottom of the first two tiers of cribbing, the logs being bolted solidly together at each intersection or crossing throughout the dam, the length of the logs and their number increasing as each tier was put in place, until the structure was 18 feet high at the face, 42 feet up stream from the face and having a width across the stream at the top of the dam of 110 feet. In its construction 260 large pine trees were used and over three tons of one and a half inch iron bolts, half a ton of spike nails and 40,000 feet of lumber, A wasteway is provided near the bottom four feet square, lined with heavy planking, which is secured by safety waste-gates so that the entire head of water may be drawn off at pleasure. The cribs are all filled with broken stone and earth thoroughly packed in. The surface of the dam is being covered with heavy planking securely spiked down. This dam is one of the most substantial structures of the kind on this coast and will endure for generations to come.

The company has a saw-mill within a few hundred feet of the dam, which is now cutting lumber for the necessary fluming on the line of the ditch. The mill will be kept running through the winter when it will be possible to do so; but, in view of the fact that the season of our winter storms has arrived, and they are liable at any time to stop the production of lumber, and in view of the further fact that it would entail a heavy expense to construct the fluming during the winter months, with all the attendant difficulties of getting in necessary supplies and material, the management reached the conclusion that it would be a matter of economy to defer this work until spring. In pursuance of this conclusion it was further decided to place all the company's work on a winter footing, only enough employes being retained to keep everything in proper shape until work shall be resumed upon the opening of spring.

SUTTER'S MILL, WHERE GOLD WAS FIRST DISCOVERED IN CALIFORNIA BY JAMES W. MARSHALL.

CALIFORNIA COAL.—The Lancha Plana coal mine, owned by Messrs. Murray & Waddell, and which has been idle for some time on account of the owners not having sufficient means to work it to advantage, has recently been leased for a period of 20 years to a Mr. Gregory, of Sacramento. The coal found at this point is said to be of a better quality than the Ione coal. The new proprietors have started in to work the property on a large scale. The mine is five miles distant from the terminus of the San Joaquin and Sierra Nevada narrow gauge railroad. At present the coal is hauled by team to the railroad depot at a cost of $2 per ton. By the cars it is hauled to tide-water and from thence shipped to San Francisco and other points. The first shipment was made two weeks ago. It can be laid down in San Francisco for $6 per ton, which will leave the mine owners a fair margin of profit. It is the intention of the new management to build a railroad side track to the coal mine, which will greatly reduce the cost of transportation to market.—*Amador Ledger.*

ENGINEERING NOTES.

Engineering and Science.

The term engineering is coming to have a broader and broader meaning. Even in the careless popular mind it covers much more ground than it did a few years since. In its highest and widest scope, practical engineering now brings all of the other sciences into play. It is engineering skill and genius which provides the mechanical facilities for applying scientific discoveries to every-day uses, and thus give them commercial values. All the other sciences are, therefore, the handmaidens of engineering science, and the genuine engineer is, in one sense, a great tactician who directs, manages and makes the other sciences serviceable. He is the planner and they are the instrumentalities.

The relations of science and engineering are dwelt upon by an article in *Nature*, which furnishes some striking illustrations of this thought.

Some thirty years since Mr. Bessemer conceived the idea that the injurious constituents of raw iron, such as silicon, sulphur, etc., might be got rid of by simple oxidation. The mass of crude metal was heated to a very high temperature, atmospheric air was forced through it at considerable pressure, and the oxygen, uniting with these metaloids, carried them off in the form of acid gases, which, on account of the heat, were in a very luminous condition. But the important point was to know where to stop—how to seize the exact moment when all, or practically all, hurtful ingredients had been removed before the oxygen had turned from them to attack the iron itself. It was suggested that each of these gases, in its incandescent state, would show its own peculiar spectrum; and that if the flame rushing out of the throat of the converter were viewed through a spectroscope, the moment when any substance, such as sulphur, had disappeared would be known by the disappearance of the corresponding lines in the spectrum. This anticipation was verified, and the spectroscope, though now superseded, long had its place among the regular appliances necessary for the carrying on of the Bessemer process.

Indeed, this process was almost completely worked out in the laboratory before being submitted to actual practice.

The basic process is the latest development, in this direction, of science, as applied to metallurgy. Here, by simply giving a different chemical construction to the clay lining of the converter, it is found possible to eliminate phosphorus—an element which successfully withstood the attack of the Bessemer system.

Again, there are few mechanical principles more widely known than that of the so-called centrifugal force. The effect of this force is that anybody revolving in a circle has a continual tendency to fly off at a tangent, the amount of this tendency depending jointly on the mass of the body and on the velocity of the rotation. It is the former of these conditions that is now being taken advantage of. For if we have a number of particles all revolving with the same velocity, but of different specific gravities, and if we allow them to follow their tendency of moving off at a tangent, it is evident that the heaviest particles having the greatest mass will move with the greatest energy. The result is, that if we take a mass of such particles, and confine them within a circular casing, we shall find that, having rotated this casing with a high velocity, and for a sufficient time, the heaviest particles will have settled at the outside, and the lightest at the inside, while between the two there will be a gradation from the one to the other. Here, then, we have the means of separating two substances, solid or liquid, which are ultimately mixed up together, but which are of different specific gravities.

The above are only a few of the many instances which might be given to prove the close and reciprocal connection between physical science and mechanical engineering, taking both in their widest sense.

A HIGH TOWER PROJECTED AT PARIS.—The Washington Monument may not long enjoy its pre-eminence as the highest structure in the world. An iron tower of the hight of 1000 feet is to be erected in the grounds of the French Exhibition in 1889. An elevator, the safety of which is guaranteed, will communicate with the summit, and visitors to the exhibition will be taken to the top for a small fee. Those who have the courage to make the ascent will enjoy an almost uninterrupted view for nearly 100 miles all round. The tower will also be used for astronomical and meteorological observations, for experiments in optic signaling, for the investigation of certain problems in experimental physics, and for various other scientific purposes. It will, perhaps, be remembered that a tower of the same elevation was spoken of in connection with the Centennial Exhibition at Philadelphia, but the necessary financial backing could not be had for the enterprise and the project was dropped.

A GOOD, CHEAP MUCILAGE.—Allow one part of white glue (or gelatine) and two parts of gum arabic to swell in ten parts of water; then dissolve, after having added one-fourth part of white sugar, at a gentle heat; strain if necessary. To prevent this mucilage from spoiling, add a few drops of carbolic acid or oil of cloves.

USEFUL INFORMATION.

Luminous Paint.

Luminous paint continues to make slow but steady progress in its application to innumerable useful purposes. Among its most recent applications may be mentioned tapes for field use at night by the Royal Engineers' department. Starting from a given point toward the front, the men leave a trail of luminous tape on their track, and on reaching a given point they mark the contour of the earthworks to be executed by the same means, paying out the tape as they return toward the camp. The working party then follow the outward trail, execute the work and return to camp without having discovered a single ray of light to the enemy. The German War Office authorities have experimented with the paint for the purposes of night attack, and Lieutenant Beppe, of the Belgian School of Gunnery, is investigating its merits in the same direction. Our own government, says the *Building and Engineering Times* (London), are also using painted framed glasses, or Aladdin's lamps, as they are called, for internal boiler inspections. General Lord Wolseley also took with him a luminous compass for the Nile expedition. It has also been applied in some large establishments to the fire buckets which are thus easily found in the dark. A South Eastern Railway third-class carriage has the interior lined with the paint on the back of glass.

AMMONIA FOR FLOWERING PLANTS AND STRAWBERRY PLANTS.—A writer in London *Gardeners' Chronicle* says: Last year I was induced to try an experiment in chrysanthemum growing, and for this purpose purchased one pound of sulphate of ammonia, which I bottled and corked, as the ammonia evaporates very rapidly. I then selected four plants from my collection, putting them by themselves, gave them a teaspoonful of ammonia in a gallon of water twice a week. In a fortnight's time the result was most striking, for though I watered the others with liquid cow manure, they looked lean when compared with the ammonia-watered plants, whose leaves turned to a very dark green, which they carried to the edge of the pots until the flowers were cut. As a matter of course, the flowers were splendid. The ammonia used is rather expensive, as I bought it from a chemist's shop. This year I intend getting agricultural ammonia, which is much cheaper. I have also tried it on strawberries, with the same satisfactory result, the crop being nearly double that of the others. It is very powerful, and requires to be used with caution.

FENCE POSTS IN SAND.—A gentleman, says the *Connecticut Farmer*, recently said that he had a tall gate post which had stood him for over twenty years. Chestnut or oak, if we mistake not. When setting the post he filled the hole with sand brought from the beach, instead of the loam dug from the hole. This post sustains a heavy yard-gate made of tight boards, and the fact of its stability seems worthy of notice. "Do you think a post set in sand will not rot?" "Well, it may not rot as soon as if set in common earth, but I do not think that is the reason exactly why the post stands so well. When the outer shell of a post decays the hole becomes too large for the post, although the post may stand for years longer before it breaks off. As soon as the looseness occurs, the fence is at the mercy of every wind, and is racked and twisted; nails are broken and boards drop off, while gate posts drop their burden on the ground. But this sand, I think, as the post decays, settles into the vacancy, all the while holding the post firmly." "It acts as a sort of automatic filling, then?" "Yes, I think so."

WHITE BRICKS.—The French are making a new ceramic product from the waste sands of glass factories, which often accumulate in immense quantities so as to occasion great embarrassment. The sand is subjected to an immense hydraulic pressure, and then baked in a furnace at high temperature, so as to produce blocks of various forms and dimensions, of a uniform white color, which are composed of almost pure silex. The bricks, when plunged in chlorhydric and sulphuric acids, show no trace of alteration. The product has remarkable solidity and tenacity; it is not affected by the heaviest frosts or by the action of sun or rain; it resists very high temperatures, provided no flux is present; it is very light, its specific gravity being only 1.5; it is of a fine white color, which will make it sought for many agricultural effects in combination with bricks or stone of other colors.

A FORTUNATE "REMARK."—It was a chance remark that led Henry Bessemer to his method of improving gun metal. After many experiments, and being sneered at as an enthusiast, iron that cost $35 a ton was turned into steel worth from $250 to $300. In 14 years, his experimental works, having returned 57 fold, were sold for 24 times the subscribed capital, and his manufacture is estimated to be worth $100,000,000 yearly.

A NEW VEGETABLE LEATHER.—This product, invented by a company in Paris, and which possesses all the properties of leather, besides being thoroughly water-proof and a non-conductor of electricity, is composed of a mixture of three kilogrammes of gutta percha, 900 grains of sulphur, one kilogramme raw cotton, 600 grains of zinc white, and 250 grains of antimony oxide. After having been mixed, the compound is vulcanized with steam, similar as is done with caoutchouc. As indispensable constituents of this leather must be designated gutta percha and sulphur, while the other ingredients can be replaced by chemicals of a like nature. Also the quantity proportions of the several components can be varied, according to the purpose for which the product is intended. The above manner of composition is recommended for the manufacture of soles and heels.

WATERMELON OIL.—Experiments have been made by M. Lidoff with a view to defining the quality of oil contained in the seeds of a peculiar variety of the watermelon plant extensively grown in the south of Russia. According to a description of the process in the *Corps Gras Industriels*, the seeds are dried at a temperature of 266° Fahrenheit, after which the oil is extracted in a Tharn apparatus. By this method there was obtained a quantity ranging from 24 to 25 per cent of a lubricating oil, with a density of 64° Fahrenheit of 0·9298. It absorbs atmospheric oxygen very rapidly, an augmentation of about one quarter per cent taking place within three days. M. Lidoff thinks watermelon oil suitable for culinary purposes, but fears that its extraction would be too costly to allow of its coming into general use.—*Ex.*

CEMENT FOR GLASS, PORCELAIN, ETC.—Take some old, soft cheese and grind it in a mortar, washing it well at the same time with hot water. After the soluble matter is all washed away, a mass of nearly pure caseine will remain. This should be squeezed in a cloth to express moisture, dried, reduced to powder, and preserved in a closely stoppered bottle. When required for use, a small quantity should be ground up with a very little water, enough to make a thick, viscid paste, which must be used at once; as it hardens quickly, no heat should be used. Only such a quantity should be mixed as may be immediately needed, as, after it once hardens it will not dissolve, and neither heat nor moisture has any effect upon it.—*Popular Science News.*

TURPENTINE AND RESIN IN THE LAUNDRY.—Turpentine in small quantities may be used in boiling white goods, to great advantage, as it improves the color, and the boiling drives off all odor. Resin in soap is quite another thing; it injures and discolores some goods, and shrinks woolens. Soap men argue that on account of the turpentine in the resin, it assists in the washing. It is used as a filler, and to make the soap hard and cheap. It is a fraud on the consumer.

GLYCERINE IN WINE.—The mellowness of old wine has been found by experiments in Germany to be due to an increase in the quantity of glycerine that it contains, rather than to a decrease of tannin. The mellowness of the drinker depends on the quantity of the wine.

GOOD HEALTH.

The Children of Alcoholic Drinkers.

Dr. Martin, of the Salpetriere hospital, Paris, has made a series of observations, stretching over a period of years, on nervous affection among the children of alcoholic drinkers. In 83 families, where one or more members showed nervous excitability, traceable to alcoholic origin, there were 410 children. Of these, 108, more than a quarter, had convulsions: and in the year 1874, 169 were dead, 241 were still alive, but 84, more than one-third of the survivors, were epileptic.

Again, alcoholism is very apt to develop itself at a very early age, among the children of alcoholic drinkers. The existence of this evil is not sufficiently recognized by medical men. Dr. Thomas More Madden has met with several cases of acute and chronic alcoholism in children of less than eight years of age. In most cases of juveuile alcoholism, the trouble seems to be inherited, more especially when the mother is an inebriate. Intemperance in women becomes, therefore, a subject of extreme importance. Oftentimes, it results from the too general custom of administering stimulants for the relief of dysmenorrhœal pain. In such cases "this unkind nepenthe" is frequently employed in gradually increasing doses, until the victim of dysmenorrhœa becomes an habitual inebriate.

Small Bed-Chambers.

There is reason to believe that more cases of dangerous and fatal diseases are gradually engendered annually by the habit of sleeping in small, unventilated rooms than have occurred from a cholera atmosphere during any year since it made its appearance in this country. Very many persons sleep in eight by ten rooms, that is, in rooms the length and breadth of which multiplied together, and this multiplied again by ten for the height of the chamber, would make just 800 cubic feet, while the cubic space for each bed, according to the English apportionment for hospitals, is 2,100 feet. But more, in order "to give the air of a room the highest degree of freshness," the French hospitals contract for a complete renewal of the air of a room every hour, while the English assert that double the amount or over 4,000 feet an hour is required. Four thousand feet of air each hour! And yet there are multitudes in the city of New York who sleep with closed doors and windows in rooms which do not contain a thousand cubic feet of space, and that thousand feet is to last all night, at least eight hours, except such scanty supplies as may be obtained of any fresh air that may insinuate itself through little crevices by door or window, not an eighth of an inch in thickness. But when it is known that in many cases a man and wife and infant sleep habitually in thousand feet rooms it is no marvel that multitudes perish prematurely in cities: no wonder that infant children wilt away like flowers without water, and that 5,000 of them are to die in the city of New York alone during the hundred days which shall include the 15th of July, eighteen hundred and ——! Another fact is suggestive, that among the 50,000 persons who sleep nightly in the lodging houses of London, expressly arranged on the improved principles of space and ventilation already referred to, it has been proved that not one single case of fever has been engendered in two years! Let every intelligent reader improve the teachings of this article without an hour's delay.—*The Builder.*

A WORD OF CAUTION ABOUT INK PENCILS.—We have to utter a word of caution about the ink pencils which have come so much into vogue lately, says the New York *Times*. A most useful implement to the business man, this innocent-looking pencil, can be converted into a treacherous friend, and on no consideration should it be used to write the signature of any one. The composition of the pencil is a peculiar combination, highly poisonous in itself, and—herein lies the danger to signature writers—competent to give off two or more impressions on damped paper—not tissue paper, be it understood, but ordinary writing paper. Our attention was first directed to this peculiarity by an astute official of the Bank of New Zealand, and subsequent experiments proved the easy practicability of making a clear copy of the filling in of a check with this ink pencil. First the writing of the check is transferred—upside down, of course—to a slip of damped paper, and from that transferred—right side up—to another slip of damped paper. We tested this recently in the case of a check written with the ink pencil and sent in from the country, and by simple hand pressure obtained a very perfect copy of the transferrable parts of the document.

A CAUSE OF BLINDNESS.—Inasmuch as blindness has frequently resulted in babies from inflammation of the eyes following childbirth, the following directions are given to prevent that disaster: First, immediately after the birth of the baby, wipe the eyelids and all parts surrounding the eyes with a soft, dry linen rag, and soon after wash these parts with tepid water, before any other part is touched. If any discharges appear, separate the eyelids with the finger and thumb, and wash out the matter by allowing a gentle stream of lukewarm water to run between them from a piece of rag held one, two or three inches above the eye. Repeat this cleansing process every half hour, for the saving of the sight depends on the greatest care and attention to cleanliness. It is the discharge which does the mischief. Rags are better than sponges, and should be destroyed at once.

WEIGHT AND HIGHT OF MAN.—It is well that all persons should know what the normal weight of man really is: The following shows the relative hight and weight of individuals measuring 5 feet and upward: 5 feet and 1 inch should be 120 pounds: 5 feet 2 inches should be 126 pounds; 5 feet 3 inches should be 133 pounds; 5 feet 4 inches should be 136 pounds; 5 feet 5 inches should be 142 pounds; 5 feet 6 inches should be 145 pounds; 5 feet 7 inches should be 148 pounds; 5 feet 8 inches should be 155 pounds; 5 feet 9 inches should be 162 pounds; 5 feet 10 inches should be 169 pounds; 5 feet 11 inches should be 174 pounds; 6 feet should be 178 pounds.

HIVES.—This trouble is caused by a perversion of the digestive functions, accompanied by a disturbance of the circulation. It is not attended with danger, and is of importance only from the annoyance which it causes. Relief may be obtained in most instances by the use of cream tartar daily to such extent as to move the bowels slightly. Make a strong solution, sweeten it pleasantly, and take a teaspoonful, say after each meal, until the effect above mentioned is produced, and continue the treatment until the hives cease to be troublesome.

FOR ACUTE RHEUMATISM.—The *Quarterly Therapeutical Review* says that the oil of wintergreen, mixed with an equal quantity of olive oil or liniment un saponis, applied externally to inflamed joints affected by acute rheumatism, affords instant relief, and, having a pleasant odor, its use is very agreeable.

SIMPLE FRACTURES may be adjusted by almost any one. Get the limb as near as possible in the natural position, and then send for a doctor. There is no great urgency in such cases.

ECLECTICS.—There are 600 eclectics practicing medicine in the State of Kansas. They have a prosperous State society, and are about to establish a medical college.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH.—Cor. Amador *Ledger*, Jan. 10: The machinery for the hoisting works to be erected over a new shaft on the Empire property is all on the ground, and the erection will be pushed ahead as speedily as possible. The new shaft is about 150 yards from the old one in a north-easterly direction. It is now 200 ft deep, and the intention is to sink 400 ft deeper.

CARLISLE.—The Carlisle company, operating the Laphata quartz claim in Willow Spring district, crushed a quantity of rock recently in a two-stamp mill, to test the quality of the ore by mill process. How it turned out we are not informed. Sinking operations are now being prosecuted. A breakage in the machinery of the Keystone hoisting works occurred two weeks ago, which took the whole of last week to repair. Six men are employed in crosscutting and sinking at the Mediam mine at Amador City under the supervision of Mr. Richards. The prospects are reported to be very favorable for the development of a valuable mine. Messrs. Shugert and Morgan have purchased a Huntington roller quartz mill, to be erected at their mine in Hunt's gulch.

Alpine.

MINING NOTES.—Alpine *Argus*, Jan. 1: Messrs. Coleman and Wallis have stopped operations at the Raymond mine for the winter. They came down from the mine yesterday, and report having a difficult time in getting into town through the snow, which was 4 ft deep at the mine. J. P. Ray of Monitor recently struck into a better looking quality of ore in his mine than has ever been discovered heretofore. No assay of the new ore has yet been made, but the appearance gives much encouragement and it is believed that the main body of ore in the mine has been tapped.

WASHINGTON MINING DISTRICT.—Grass Valley *Union*, Jan. 10: Joseph A. Everett, who has been engaged in building the new ten-stamp quartz mill for the Cornucopia and Secret Treasure Company, in Washington township, has returned home, and says the mill is completed and is now ready for operation. The mill will be run by water under heavy pressure, being taken up after being first used at the Lindsay mine, which is some hundreds of feet higher on the mountain side. The mill will be well supplied with quartz, as the company has four distinct ledges in its location. Beside the Cornucopia, within a circuit of one mile, are the Yuba, Eagle Bird and Lindsay mines, all run by water power, and all running constantly on pay ore. Besides these three there are a number of other locations upon which developing is going on, and the general prospects are very encouraging, and during the coming spring other mills will be put up. The district is attracting much attention from quartz miners, and a large number are at work prospecting, whose numbers will be increased when the winter storms are over. The district bids fair to become noted for the extent of its quartz mining.

El Dorado.

GREENWOOD.—Cor. *Mountain Democrat*, Jan. 10: "The heavy rain has given our miners a full supply of water, and work is going on with good prospects in many claims long idle, with every indication of a prosperous mining season. Martin Bliebtreu, a few days since, obtained a large and handsome specimen in quartz on the Cedarberg croppings, for which he has refused $125 in its native state. The Revenge mine is at work steadily, with encouraging prospects.

STARTED UP.—On Monday of last week Thomas Alderson put a full force of men at work at his gravel mine on Cedar Ravine. This mine had been shut down for about three weeks, being flooded by the late heavy rains.

Inyo.

CERRO GORDO.—Inyo *Independent*, Jan. 10: Mr. Boland has made an examination of the mines at Cerro Gordo and finds the old workings badly caved, especially the Union tunnel. It will take some time and a good deal of labor to put the mines in a condition for getting out ore again. The work will be pushed ahead as rapidly as possible, however. A mistake was made in stating that Mr. Boland had leased the furnaces; his lease covers but the right to work the mines.

ANOTHER STRIKE.—Arizona *Star*, Jan. 10: Special advices from Globe say there is prospect of serious trouble between the management of the Old Dominion Copper Co. and the Miners' Union. The mines and smelters have been closed down since Monday, pending arrival of coke, which has been delayed owing to the heavy condition of the roads. This morning five men were put to work on the surface at the smelter, at $3 per day. Members of the union learning of this, called a meeting, at which a committee was appointed, with instructions to wait upon the five employees, working at reduced wages and order them to quit. Superintendent Trippet, learning of this procedure, immediately had all work cease; also withdrawing proposals for contract work in the mine. The union held another meeting this afternoon, but the result of their deliberations could not be learned. They marched down Broad street in a body, numbering forty-nine. This conflict coming at a time when the price of copper is so low, and the outlook discouraging, is a serious matter for Globe.

Nevada.

RICH ROCK FROM THE HARTERY.—Grass Valley *Union*, Jan. 10: The Hartery mine shut down recently owing to the contemplated removal of the machinery, which did not belong to the company, and preparatory to putting in stronger power to do the pumping and hoisting. Before the water raised in the shaft, however, to stop all work, James Bays and his partners, in all four persons, continued work on an upraise between the first and second levels, 240 ft south of the shaft, and in 8 days work took out a lot of rock which proved very rich, and in pounding it out in hand mortars 80 pounds of sand of one lot gave a yield of $1,280, and the remainder yielded $580, or in all $1,860. This was taken from a small ledge, from one to eight inches in thickness, which was a spur from the main ledge. The work was done under great disadvantage, and the men had to quit their labors, leaving rich rock on account of the water raising to the hight of the second level and driving them out. When the mine shut down tributers were taking out rock in the levels north of the shaft which gave a yield of $33 per load. The appearance of the mine was quite encouraging, and will justify the owners, Wm. Loutzenheiser and partners, to resume operations during the present season by putting up new and stronger machinery and to conduct operations systematically. The good returns of the mine for the past few months have been such as to show that the Hartery can be made a regular gold producer.

FINAL CLEAN-UP.—Grass Valley *Union*, Jan. 14: The final clean-up of the tribute rock from the Hartery mine, taken out before the mine shut down, was made on Monday. The tributers, some ten in number, were at work from September 20th to December 15th, and the lowest of their rock was $8.40 per load and the highest $119.85, the average being $39 per load—a very satisfactory result. It is expected that work will be resumed on the mine during the coming season, with stronger and better machinery than heretofore used.

THE CHAMPION.—*Transcript*, Jan. 11: Good ore is coming out of the Champion mine in two places—from the shaft on the hill near the Nevada City hoisting works and from the shaft which starts in the tunnel about 100 feet from the entrance. All that the Champion needs is well directed prospective work to make it a large and steady producer of bullion.

Plumas.

GREEN MOUNTAIN.—Greenville *Bulletin*, Jan. 7: During the late storm, the mill was idle four days. The heavy rains made repairs on the ditch necessary. The water supply at present is not good, and it may be necessary to turn the water off and clean out the ditch. Work in the mine is progressing favorably, the ore is of good quality, and steady running of the mill would produce a good profit for the company. If no unforeseen delays occur, the Sulphuret cbute will be reached in two weeks.

Shasta.

NOTES.—Shasta *Democrat*, Jan. 7: We are informed that agents for W. T. Coleman are negotiating for the purchase of one or two mines in the "Old Diggings" district. The late storm having furnished an abundance of water, the miners around Copper City are putting in their best licks. The people there are jubilant over the good prospects of re-opening the Winthrop mine at an early day. Richard M. Johnson has been engaged the past summer developing Hull, Taylor & Co.'s coal mine in Big Bend of Pit river. He brought down a quantity of coal with him and experts pronounce it of first-class quality. The bad weather and roads have unfortunately retarded the progress of the erection of Coleman's fine quartz mill at the Niagara mine. Some of the machinery yet remains at the depot to be shipped by team to the mine. We want to see this mill in successful operation, for we know it will give a boom to the mining interests in the French Gulch district. James Feour, of French Gulch, was in town last week and reports good prospects ahead in that rapidly-improving mining district. For several months past he and his partner have been hard at work developing their ledge on the Deadwood and French Gulch divide, but on account of snow have stopped work until winter breaks up. They have several tons of ore on the dump that is rich in free gold and the ledge looks better as they go down. Garber & Co., of Portugese Flat, who about a year ago purchased the Bob Pitt mining property at that place, after getting everything in shape and spending considerable money on hydraulic mining machinery, a few days ago commenred active operations on their claim to drive things lively. This has long been considered a rich claim, and the new proprietors are sanguine of cleaning up a good pile in the spring. Other miners in the district are also at work.

CENTERVILLE DISTRICT.—Cor. Shasta *Democrat*, Jan. 7: While we hear from our neighboring towns and mining districts, let us say that we are in the land of the living, and while we say nothing of our mining camp, we can and do produce as rich gold and silver-bearing quartz as any other camp in the county. We have the Silver King mine, owned by Brincard & Lowery, that is rich in free-milling silver ore and assays from $50 to $200 per ton, and the parties intend developing this mine as soon as spring opens. John Doeblin, of Muletown, also has a good gold-hearing quartz mine which he has bonded to a San Francisco company. Work will soon be commenced. It is a large ledge from two to three ft in width and the croppings will mill from $8 to $15 per ton. Stanley Myers, of Shasta, while hunting for deer along the Muletown mountain discovered a ledge from twenty inches to two ft in width which is very rich in gold and gold-bearing sulphurets, and is now running a tunnel to prospect it in depth. As it is located on the highest peak in that range of mountains it is no trouble for him to tap his ledge four or five hundred ft in depth by a short tunnel, and if it should prove to be as rich as on top, Stanley will not have to go to New River to hunt a bonanza. While we speak of quartz, we must not slight gravel mines in this camp. George Reese, one of the old pioneer miners, has fitted up his placer claim near Texas Springs and is now ready to cut his gravel bank. He anticipates a rich clean-up, as the late rain-storm filled his 20-acre reservoir, so he will not want for water even if the Clear Creek ditch is not brought in here this winter. Isaac Hare has commenced work in his Bulgin (?) Gulch claim, and has rebuilt his shooter so as to flood out the tailings and to pipe down his gravel bank to a good advantage. Brincard, Lowery and B. B. Martin are running a tunnel into their blue gravel claim near Jackass Flat. They are in with their tunnel about 200 ft and are getting good prospects. If the Clear Creek ditch was rebuilt so that the miners could have water I am sure there would be many more mines in operation and it would make this one of the liveliest camps in the county.

Sierra.

WORK SUSPENDED FOR THE WINTER.—*Tribune*, Jan. 10: Van Slyke & Maxon have suspended operations for the winter at their mine in Hog Canyon. They have done considerable work there this summer, having sunk one shaft on the ledge to a depth of 65 feet, and two or three others to a lesser depth. The ledge is seven to nine feet wide in the bottom of the 65-foot shaft. The ore does not show much free gold, but when it is pounded up in a mortar and panned out it yields the biggest kind of prospects. The parties propose to start up work at the mine again next spring on a more extensive scale. They undoubtedly have the making of a big mine there, and although they are not possessed of an abundance of capital, they will find a way to develop their mine.

NEW MACHINERY AT THE ALASKA MINE.—A pump weighing 26,000 pounds has been ordered and is expected at the Alaska mine some time this month. It will be hauled there whenever the roads are in good enough condition. Two loads of machinery arrived at the mine last week. They will not be able to get the rock breaker through from Nevada City till the roads improve.

BULLION SHIPMENT.—Thirty-two thousand dollars in bullion was shipped from the Alaska mine, at Pike City, to the San Francisco Mint recently. They are making regular shipments of bullion from that mine. The above is only a drop in the bucket. There are many more mines like the Alaska in Sierra county, if they were only developed.

Santa Barbara.

THE GYPSUM QUARRY.—Cor. Santa Barbara *Press*, Jan. 10: Mr. C. H. Clark, of the Point Sal Quarry, writes us as follows: We have shipped 8 cargoes of gypsum from here this season over the wire cable. The quarry of gypsum is inexhaustible. We have from 1½ to 2 miles to haul by team. It is mined the same as coal, but is of the opposite color, gypsum being white, some blue, and very rarely brown or dark red; one not accustomed to seeing gypsum would call it quartz rock. It is solid and apparently as firm and hard as any rock. It has, however, no grit and will not dull a knife to cut it. It is easily drilled. We use powder as in any rock to blast it out, and it is broken in pieces convenient to handle, and shipped in bulk to San Francisco, to the Golden Gate Plaster Mills, the only mills on this coast. Since they have been working the rock from here, it is claimed by many who use a large quantity of plaster that it is a better article than can be had from the East. This is claimed to be the finest gypsum on the coast. Many people will show a piece of transparent mineral resembling isinglass and claim it to be gypsum, but it is found usually in clay and on the outside of gypsum deposits, but is of no value whatever. Pure pieces of white gypsum when broken in lumps could not be told from pure crushed sugar by looking at them, which will give a good idea of what it looks like. Take the broken rock as we handle it and about 3 ft cube will make a ton, which is 2,240 pounds.

San Bernardino.

DANBY.—Cor. *Foothill Tidings*, Jan. 10: Danby is situated about 600 miles from San Francisco, on the line of the Atlantic and Pacific Railroad, and promises to be a large mining camp in a few years, being surrounded by very rich paying silver ore mines. Prospectors with burros and light wagons travel through here daily, en route to Calico and Providence, the principal mining camps of San Bernardino county. A location about eight miles from here was purchased by Schilling and Lindenfeld, of Los Angeles, and is being prospected, and at a depth of twenty ft some rich silver ore is being taken out. Water is very scarce around here. Prospectors within ten miles come here to get water from the railroad tank, which is furnished to them free. The railroad company was given a spring about six miles from here, by the Bonanza King Mining Company, to provide all prospectors and the Bonanza King Company's teams with water at Fenner, where the stage leaves for Providence mining district daily. The Bonanza King Mining and Milling Company is composed principally of eastern capitalists. The shaft is down some 600 ft. Mining down to the third level was done on the chutes which were seen from the surface, but on the sixth and seventh levels they increase in number. The mine was purchased by this company for $3,000, and they have expended for putting up a mill and labor nearly $250,000, which, by this time, has been paid back in dividends. The mill has been in operation for nearly two years, turning out a steady stream of bullion of from $30,000 to $50,000. The Bonanza Company have several claims. The mineral zone on which this company is situated is claimed and located for about six miles distance.

Siskiyou.

THE BLACK BEAR MINE.—Yreka *Union*, Jan. 8: Twelve hundred tons of rock at the Black Bear is ready to be crushed, and no more will be mined until spring. This amount will keep the 32-stamp mill going for two months. Mr. James Gould, a gentleman of great experience in mining, has been appointed superintendent, in place of J. B. Little, resigned. Mr. Little has managed the affairs of the company for some time, and has won for himself many friends during his residence in this county. He will soon leave for below.

Trinity.

GOOD-BYE JOHN.—Trinity *Journal*, Jan. 10: We have been reliably informed that all the Chinamen—some 20 odd—employed in and about the Lambeth mine, in Deadwood mining district, have been discharged, and white labor to the number of ten have taken their place. This action was urged by the foreman, who very wisely had come to the conclusion that ten white men can do the work better and more satisfactory than the 20-odd Chinamen.

THE OWNER.—We learn that the quartz mines recently purchased from Mr. Jacob Holsinger and others in East Fork district are the property of the Yellowstone Mining Company, a San Francisco organization.

NEVADA.

Washoe District.

SUTRO TUNNEL.—Following is the report of progress and details of work in the Sutro tunnel during the month of December: Main tunnel—Repairmen between points 12,800 and 12,900; removed of old timber 24 posts and 11 caps; squared ground and put in 22 posts and 9 caps of new timber; also lagged and braced sets, repaired track in places and cleaned up debris. Main tunnel drain repairs—Between points 11,000 and 11,100, 100 new covers and sides were placed on drain boxes; between 10,800 and 10,900, 300 new covers and four sides; between 10,700 and 10,800, 170 new covers and two sides; between 10,500 and 10,700, 200 new covers and seven sides. North lateral, south of Gould and Curry connection—Repairmen removed 31 posts and 14 caps of old timber; squared ground and put in place 32 posts and 11 caps of new timber; also, lagged and braced sets and cleaned up debris; retimbering completed for a distance of 58 feet and seven inches. North of Gould and Curry connection, 19 posts and eight caps of old timber removed and 20 posts and nine caps of new timber put up; sets lagged and braced and debris cleaned up; distance of timbering completed, 48 feet and six inches. Flow of water in standard gallons per day, 8,852,600.

HALE AND NORCROSS.—Virginia *Enterprise*, Jan. 10: Work was resumed in cross-cut No. 2, on the 2800 level, on Tuesday morning. It is passing through a solid body of quartz that shows occasional streaks and bunches of ore assaying from $5 to $30. Nothing is being done in cross-cut No. 1, nor at the bottom of the winze on the 3000 level. Work will not be resumed at all points until connection has been made between the Combination shaft and the bottom of the winze at the 3000 level.

UNION CON.—The east cross-cut, started at a point 300 feet south of the joint Sierra Nevada winze, is making good headway and is in very promising material, consisting of quartz, clay and porphyry. The diamond drill is constantly kept ahead of the face of the drift to guard against water. On the 1600 level the drain tunnel is being repaired.

COMBINATION SHAFT.—The Cornish pump is running all right and the new hydraulic pump is up and in order. It will probably be started up to-day. They were yesterday filling the supply pipe and making every preparation for a start. So careful have they been in all the preparatory work that there will be no trouble when the pump is finally set going.

ALPHA.—The cross-cuts have passed through the large body of quartz found on the 600 and 900 levels without developing a deposit of ore that would pay for working, though many spots were found that assayed from $5 to $50 a ton. Sinking below the 900 level is the next work in order.

CON. CALIFORNIA AND VIRGINIA.—On the 1500 level are repairing the main drift. Slope No. 6 on the 1750 has been repaired and put in order for the extraction of ore. The repairs to the station and bob pit at the 1900 level have been completed.

ALTA.—The east cross-cut on the 1350 level is finding some very favorable material. In that direction there is a large body of solid quartz. The water rises very slowly and it will be long before it reaches the 1350 level.

SIERRA NEVADA.—The new prospecting drift on the 2300 level is making good headway. It is a favorable formation consisting of quartz, clay and porphyry. Some very encouraging assays have of late been obtained.

GOULD AND CURRY.—The main west cross-cut on the 825 level near the Savage north line is in a mixture of quartz, clay and porphyry of a favorable appearance. Frequent stringers of mineral-bearing quartz are found.

BEST AND BELCHER.—The west cross-cut on the 825 level, at the Gould and Curry north line, is still in vein material of a very promising appearance. Streaks of the quartz are occasionally met with that give low assays.

YELLOW JACKET.—A large amount of low-grade ore is being extracted and sent to the mills, and the exploring drifts are still finding new deposits. Some very rich bunches of ore are occasionally found.

OPHIR.—The west drift on the 500 level is now in the edge of the old workings and the water has about drained out. Good headway is making in the sinking of the winze below the 1500 level.

BELCHER.—The E-street tunnel now has less than 50 feet to go to reach the point where it is expected that low-grade ore will be found. The tunnel is already in a vein formation.

SCORPION.—Good headway is being made in the north drift on the 500 level. The ground during the past week has become softer and more favorable in every respect.

CROWN POINT.—The old upper levels continue to yield a considerable amount of low-grade ore, which is being sent to the mills on the Carson river for reduction.

OVERMAN.—The extraction of ore through the old Petaluma-street tunnel has been discontinued, as it was found to be of a grade too low to pay for milling.

SAVAGE.—The E-street tunnel is into the ledge. Some ore has already been taken out and they are now preparing for regular exploration.

ANDES.—Preparations are being made for the resumption of work in the lower levels.

MEXICAN.—The main south drift on the 2700 level has been cleaned out and repaired.

Como District.

CAPITAL WANTED.—Virginia *Enterprise*, Jan. 10: The miners of Como are deserving of encouragement and good luck this year. Their camp is promising to a great degree, and yet for some unaccountable reason they cannot get capitalists in to develop their properties. At one time, just before the great excitement in Virginia City, the camp had a population of over 3,000, but it is now the habitation of only twenty or thirty people.

Cortez District.

BULLION HILL.—Cor. Eureka *Sentinel*, Jan. 7: The camp was discovered in 1863, and was worked by the Cortez Mining Company for three years under the management of Gov. Chillis. It was then abandoned by the company and left idle until 1870, when the chloriders tackled it, who bave ever since worked it in a desultory manner. Not a single failure has been made where any work or judgment was employed in the mines. Not a dollar of outside capital has ever been used in the development of the camp since 1866. There never has at one time since 1870 been more than 6 men at work here steadily, and for long periods it would be deserted—generally just after a few good shipments of ore would be made. The miners never ship any ore less than $100 per ton, and I know of two ledges in the place which will average $75 per ton. One of them is 20 inches in thickness, and it is opened for 100 ft in length. Both are idle. None of the mines have been worked deeper than 100 ft. At the present writing, Bullion Hill can show the richest bonanza of any camp in the State, which since last writing, has increased in size from 4 ft to 6 ft in thickness, and averages $800 per ton. The happy owners are Gillam Brothers

and Tex. Smith & Co., of the Aurora, have in the face of both of their tunnels small seams of ore which assay from $300 to $4,000 per ton. The tunnels are approaching two interesting places in the mine. At the ores of Bullion Hill are sent to Salt Lake for reduction at a cost of $27 per ton for freight. This is felt to an extent by the miners, for all the ore that has been shipped might be safely estimated to average $200 ton. Here is a list of mines which are working, and the amount produced by each: Maid Queen, $31,000; Silver Fleece, $4,500; Midnight, $12,000; Gillam & Tex, $30,000; Aurora, $9,000. Here is a list of the mines that are idle, and what they have produced in the past, as near as I can ascertain: Roscoe Conkling. $11,000; Lone Star, $36,000; Poorman, $34,000; Ironsides, $25,000; Burling, $40,000; Fitzgerald & Blifford, $20,000; Paymaster, $15,000. Total, $308,000. There are a gr at many smaller claims here which have produced small lots of ore.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Jan. 10: The north cross-cut on the sixth level has advanced 17 feet during the week, and the west drift on the same level has been driven 15 feet. The west drift on the fifth level has been stopped for the present and a south cross-cut started near the face of the drift. The raise from the west drift on the fifth level is up 19 feet, and shows a foot of $70 ore. Some $40 ore is being taken from the fifth level near the winze No. 1, and also from the same level near winze No. 2. The intermediate between the third and fourth levels and near winze No. 1, is giving some $50 ore. The intermediate, between same levels near winze No. 4, shows a small bunch of good ore. Nearly above this winze, between the second and third levels, some $150 ore is being taken from a narrow ledge. The stope, between the second and third levels and west of the shaft, is looking about the same. The intermediate, between the first and second levels, is giving considerable high-grade ore. Some ore of fair grade is being taken from the first level.

Pyramid District

ANOTHER STRIKE.—Reno *Gazette*, Jan. 9: A report came in to-day that a strike had been made in the Pyramid Lake mine of ore that goes $1,500 to the ton.

Spring City District.

LIVE YANKEE.—*Silver State*, Jan. 10: Nick Frayer, superintendent of the Live Yankee mine, at Spring City, arrived here yesterday from his mine, and reports very flatteringly of the results of his new concentrating works, which are operated by the Huntington crushers and the Challenge concentrators. By the concentrating process, ten tons of ore are reduced to one ton of concentrations, which contains all the precious metals that were in the whole bulk at first. He showed us specimens of the concentrations, of which he had two large vials with him. These specimens were of ore reduced to an almost impalpable powder, and, as his ores are mostly of the high-grade order, of course they assayed at a high figure. The ores are run through the process of crushing and concentrating, and then in reduced form are shipped to Salt Lake by railroad, where their final treatment takes place. It is said that a higher percentage of the value of the minerals contained in the rock can be obtained by the concentrating process than by any other way. Mr. Frayer says he has power enough to drive six concentrators and two crushers. At present his works contain but two concentrators, but it is the calculation of the company to have two more added at an early date, when 25 tons of ore can easily be reduced per day. The process he uses is something new, and, by the commencing trial, he feels assured that it is a sure success.

Taylor District.

REDUCING FORCE.—Cor. Eureka *Sentinel*, Jan. 10: The Monitor Mining Company paid off all its miners on the 3d instant up to date, and laid all hands off, with the exception of twelve—eleven in the mine and one drill sharpener. As the mill is run by water power, they had to shut it down for the winter season; so it throws some men in our midst out of employment, who are on the work if they could get it. The Argus Mining Company's mill and mine is still running, the death of Mr. Aultman not affecting anything here, although he was a half owner in the property. On account of the heavy discount on silver the manager here was forced to lower wages fifty cents per day—from $4 to $3.50—at the same time assuring his men if silver went up and the mine could afford it, he would put wages back to its old standard of $4.

Tuscarora District.

INDEPENDENCE.—Tuscarora *Times-Review*, Jan. 8: The usual progress has been made at all points, showing no change worthy of mention.

NORTH BELLE ISLE.—The usual progress is being made in north drift, 70-foot level. The face still continues favorable.

BELLE ISLE.—No. 1 upraise, 150-foot level on east vein, has been carried up during the past week six feet; total distance 60 feet. No change since last report.

GRAND PRIZE.—South drift on the 400-foot level has been extended 23 feet; on the 300-foot level 29 feet, and on the 200-foot level 24 feet. The mill will start up to-night to work what ore is out.

NAVAJO.—East cross-cut, 350 level, advanced 13 feet during the past week, total distance 88 feet, showing no change. All work other in and about the mine is progressing as usual. The stopes are producing the usual amount and grade of ore.

ARIZONA.

FROM BISBEE.—Tombstone *Epitaph*, Jan. 9: A friend of the *Epitaph*, writing from the Atlanta mine, near Bisbee says: "As regards the Atlanta mine, it is useless for me to begin to describe the enormous extent of ore bodies (as the report I might give would undoubtedly be shelved with the many other wild cat mining speculations); suffice it to say on our 200-foot level drifting and raising is down to the amount of about 200 feet all in ore of good paying quality. On the 250-foot level but little work has been done, other than running a drift over 100 feet, in which much ore was encountered. The 320 level has developed into an enormous deposit of rich copper. Notwithstanding exploring drifts have been run in different directions amounting to over 600 feet. The whole area will in time pass through the smelters, saying nothing of the continuation of the ore body yet remaining to be explored. A shaft is started for another level below the level referred to, and is much richer in copper than anything yet discovered * * * * The work in this mine was begun on the first day of April last. Notwithstanding the capping of hard limestone which abounds in this zone, yet practical experience often leads to success."

YUMA MINES.—Cor. Arizona *Sentinel*, Jan. 10: There has been much activity among the miners during the going out of the old year and the coming in of the new. Several claims have been re-located in the Gila City range, the Posa mountain, the Cabeza Prieta district, the Pinto and Mohawk ranges, and those who have failed to keep up assessments are left. The new district in front of Mohawk, to the north is receiving considerable attention. There are almost inexhaustible supplies of free milling gold ore, which assays all the way from $5 to $100 per ton; and in order to have an immense bullion output a good stamp mill is only needed. A new district of mineral has been discovered, and has been named the Chloride. It is south of the S. P. R. R. from Tacna. Several locations have been made. The ore assays well on the surface. The veins are permanent and wide and of the true fissured class. There will be news for the public from Yuma county mines during the present year. From the number of fresh horses' tracks made along mountain and mesa, I predict a golden harvest for our County Recorder during the next 60 days.

A RICH STRIKE.—I send by Mr. Douglas some specimens from our mine, the "May Queen" in Silver district. We are now down about 12 feet. We have two feet of ore which will assay from 18 to 200.34 ounces of silver and from forty to sixty per cent lead. We have several sacks of ore out and take out from one to four per day, and have several tons in sight. We have a cut running about 30 feet and a solid vein of galena ore running the whole length, nearly two feet wide. As we go down the ore becomes richer.

TURKEY CREEK.—Prescott *Courier*, Jan. 10: E. T. Johnson, who has just come in from Turkey Creek district, gives the pleasing news that Messrs. Gavin, Morgan and Roberts are once more taking very rich silver ore out of the Pine Spring mine. D. W. Clearwaters is shipping supplies to the Howard mine, from which he proposes to take ore. This mine is about four miles south of Prescott. The old Sterling mine, six miles south of Prescott, has again come into favor, and will, it is said, soon change owners. Mining news from the counties of Yuma, Mohave, Maricopa, Pima, Cochise, Pinal, Gila and Graham gives proof of a revival of the industry.

COLORADO.

GENERAL NOTES.—Colorado *Mining Gazette*, Jan. 7: The Grand View mine, on Seaton mountain, extracts and is shipping large quantities of good-grade ore. Major Kelso, of Georgetown, is shipping ore to this place, and says the market is one of the best in this section. The Maple Leaf mine, on Fall river, is being extensively worked, and the ore is being shipped to the sampling works at this place. There will be such a revival in gulch mining next spring on the south fork of Clear creek as to astonish even an old Alder Gulch miner. The Stover, Humboldt, Mary Foster, Molly Bawn, Little Ute, Chance and Paymaster lodes, in Bullion camp, are now being worked and in good pay. They are working the Silver Cliff lode on Ute creek and have exposed in the breast of the adit, being driven into the mountain, a streak of solid ore one to two inches wide of high grade. Mineral of high grade was struck this week at a depth of 40 ft in the shaft of the Jennie Hedden lode, Spring gulch. This is the property of our enterprising business man, Mr. William Townsend. The depth of snow in the camps surrounding Idaho Springs surpasses anything that has ever been seen for years. Until a change of weather takes place it will be impossible to furnish supplies to the mines. The Ettie M. Beck is the name of a new discovery in Gold Dirt mining district, by Mr. Bailey, of Denver. The quartz at the surface pans well in gold and is in close proximity to his mill.

ELK MOUNTAIN.—*Pilot*, Jan. 10: Everything at the Forest Queen is working smoothly. The concentrator is kept busy and is doing very good work. They have recently increased their working force, and will do much toward keeping the ore haulers busy. At the Bullion King things pursue the even tenor of their way. At present an upraise is being made for an air shaft, the bad air having bothered considerably of late. They are shipping some very fine ore. The tunnel on the Ruby Chief has reached a drift in the old workings. The drift with which connection was made is ninety ft from the surface, and connection was made by an upraise of seventeen ft from the tunnel, which shows a depth of 107 ft. The contractors, who were to take their pay from the mine, in ore, will begin shipping immediately. The Chief will be a steady producer the coming season. Work at the Great Eastern continues and ore is good. Although one vein has been cut at the Richmond, the tunnel is still being driven ahead. At the Augusta nothing but development work is being done, in fact this is all that can be done up here in the winter season. On Slate River the Monitor is working quite a force and considerable ore, much of it low grade, is being taken out. The Big Elephant is working a small force developing and will probably be among the producers this season.

IDAHO.

FROM ATLANTA.—Idaho *Statesman*, Jan. 6: Mr. Thos. Finnegan came down from Atlanta, arriving here on New Years. Mr. Finnegan has been at Atlanta since the 1st of June, doing the mason work for the new Atlanta mill (Pettit's mill). The Atlanta mill started up about the 15th of December and will continue running all winter. They run from 15 to 20 tons a day, and the yield is satisfactory. The Atlanta mill is working 15 stamps, and will place five more the coming year. The Tahoma mill started up early in the fall, and has been running for several months and will run all winter. This is a new ten-stamp mill and the ore pays well. Atlanta is really a live camp. The snow is about three feet deep and the weather but moderately cold. They have plenty of supplies for all winter.

CŒUR D'ALENE.—Butte *Miner*, Jan. 7: Mr. Eugene Morier, who has just arrived from the Cœur d'Alene country, informs us that but little work, comparatively, is being done in that country at present. About three feet of snow covers the ground and has obstructed operations. Mr. M. says but half a dozen claims are being worked on Prichard creek, and those at a great disadvantage. Since the great stampede, those who went to stay, have prospected with good results, Trail gulch, heading about two miles from Prichard creek and emptying into Beaver creek has proved wonderfully rich. Two side gulches, viz. Placer and Potosi are being worked and good wages being taken out. The Dutch Jake and Van Dorn bars in Trail gulch are doing well, several rockers being at work daily. The water is furnished from snow, melted in five gallon oil cans and a sufficient supply gotten to wash out big wages. The Myrtle claim which is owned by Messrs. O'Connor, Mooney, Jimmy Osburn and Buckingham is situated at the mouth of Placer gulch, and has proved a most valuable investment. The first two day's work after purchase turned out dust enough to pay back all the money advanced. The lower claim has been worked by 12, 14 and 20 men. At present six men are engaged sinking a shaft to the bedrock on the upper claim. A large over-shot wheel is at work carrying water from the bottom of the shaft to the surface. The Myrtle Co. has been paying their men from $3 50 to $4 per day, and two of the hands have received $5 per day. Several rich nuggets have been found and several thousand dollars worth of dust taken from the two claims. The country will be more generally prospected next spring and summer. Huzzy bank has done a good business. Very many will return in the spring and resume work. The entire county will be overhauled and every foot of it generally prospected. Mr. M. says the mines were so greatly misrepresented that thousands went there only to meet with disappointment.

MONTANA.

BONDED.—Butte *Miner*, Jan. 7: The Molly McGregor mine, lying in the Boulder district has been attracting considerable attention for the past year because of the valuable ore extracted from its internal workings. The mine is owned by John H. Curtis, J. R. Boyce, Jr., A. G. Clark, and Col. C. D. Curtis. Development of the mine has proven the early prediction as to its value. A vertical shaft has been sunk 110 ft on a vein of ore and from the 110 ft station levels were run 50 ft east and west in bodies of handsome galena ore which assays from 75 ounces to 125 ounces in silver and 60 per cent lead. The workings give such evidence of true fissure vein that Mr. C. Moore recently took the mine under bond for a Connecticut Co. and will work it for one year. One fourth of the ore extracted goes to the present owners, Specimens of the ore may be seen at the office of Curtis and Majors. The Parnell lode, adjoining and south of the Geneva, owned by P. J. Hamilton and J. H. Curtis is now under bond to a California company represented by W. H. Davis of San Francisco. The Parnell vein is opened by several shafts from 15 to 20 ft in depth each one of which shows the vein. Several tons of ore are on the dump. The assays show from 45 to 150 oz. silver. The ore is free milling and easily extracted. The bond runs for six months and one fourth of the ore taken out goes to the owners provided the mine is not taken. Those familiar with the ores and the location are satisfied that the property requires but a touch of the hammer to make it one of the best paying claims in Silver Bow county. Work will be heavily pros cuted fn the early spring.

CLEAR GRIT.—*Inter-Mountain*, Jan. 6: The Clear Grit is being actively worked under contract by Henry Williams, who with a force of 30 men is extracting from the 320-ft west level 25 tons of ore daily. Bucket samples yesterday averaged $40 in silver and from 10 to 15 per cent copper. Joseph Daft & Co., who have a lease on the Marie, north of Waterville, are taking out several tons daily of high grade silver ore which is yielding a handsome profit. A steam hoist will soon be in operation on the Amy-Silversmith as a result of the greatly improved appearance of that rising property. Adam Farraday began work to-day on the west extension of the Morning Star, where he has some of the. old time quality of ore.

NEW STRIKE.—Butte *Miner*, Jan. 7: To Mr. G. H. Bibbs, who is somewhat interested in mining matters, we are indebted for some very interesting items of news. Mr. Bibbs arrived yesterday morning from a new prospecting country, about 30 miles south of Butte, where he has discovered a body of fine-looking ore—originally a blind lead—which promises favorably for the owner. The ore brought in assays from 40 to 200, 300 and 500 ounces in silver. It carries chlorides, copper, gold and other metals, but will pass as silver glance rock. The shaft is now down 12 ft on a 10-inch vein, between well-defined walls, and is widening. Timber and water are plentiful, milling facilities good, and its location accessible. The find will undoubtedly prove the starter of a new mining district. Mr. Bibbs also informs us that at Rochester Basin the company's mine, owned by C. B. Ward and Dr. Getchel, has been opened by shaft to a depth of 120 ft. Geo. F. White, the superintendent, is taking gold ore from the 4-ft vein, which goes $10 to the ton, and will have it worked in the new arastra now in course of construction. The Longfellow mine has a shaft 15 ft deep from which the owners are extracting 30 ounces carbonate of lead ores. The Resumption mine, a gold property, has not been worked for a week or two, owing to the absence of one of the owners (Mr. Bolger), but operations will be resumed upon his return. The old Watazicka is lying idle for lack of means to prosecute the work, $50,000 having been expended upon the mine, and over $250,000 taken out. If properly handled the property would prove a veritable bonanza to some practical capitalist. The surrounding country has not been so thoroughly prospected as it should have been, but with an excellent field for faithful work promises well for a brilliant future. Like many other districts, the main drawback is lack of capital.

SHERIDAN.—Cor. Butte *Miner*, Jan. 10: Mines in the Mill Creek district are improving up some. There has been lately a rich strike made on the Big Chief mine, owned by Phillip Frank and H. S. Gilbert. The shaft is down 65 ft. They have four ft of paying ore; one foot assays 1,200 ounces and five inches 2,000 ounces per ton in silver. Mr. A. Cisler is sinking a two-compartment shaft on the Bullion lode. He is taking out 150 and 200 ounces silver ore. In the spring he is going to put in new machinery in his 20-stamp gold mill for concentrating the low-grade ore, of which there is plenty in this camp. R. T. Bateman is working on the Nelly Darby. He has now five ft of concentrating ore, and is confident of striking a big bonanza before spring. Hall, Hardisty, Heman, T. Frank and John Ruhor have four or five valuable locations, each of which will undoubtedly prove a bonanza after being more developed. All these mines are on the same belt, in the vicinity of Brandon, three miles east of Sheridan. Seven miles from Brandon, up Mill Creek, Jim Bradley and Tom Burnham have a gold lode which runs $100 to the ton, worked by arastra.

NEW MEXICO.

THE CAMPS.—Silver City *Enterprise*, Jan. 4: Smith & Christian, of Fleming, have made a rich strike in native silver at Gold Hill. The Ad Valorem, at Gold Hill, owned by Gettings & Miller, shows a vein of about twelve inches which assays nearly $400. A rich strike in horn and native silver was made at Bullard's Peak while doing the assessment work on a claim owned by M. H. Twomey. Cottrell & Lewis, of Gold Hill, are taking out some very fine ore which they are sacking for shipment. The Montana, Sitting Bull and Tenderloot mines, in Gold Gulch, were recently bonded to W. M. Johns for $30,000 on six months' time. The property is owned by Messrs. Kious, Scarritt, Mdone and Miller. Bob McCone is one of the lucky men at Gold Hill. He recently made a strike in brittle silver that assays $1,000 per ton. We have been shown some pieces of ore that will weigh about 150 pounds each, and will run 60 per cent silver, taken from the 500-ft level of the Blackhawk mine. The Mimbres mill has been closed down for some days past owing to the heavy snowfall and consequent bad condition of the roads. W. G. Stegman, Robert Jones and J. G. Park own some exceedingly fine prospects at Gold Hill, upon which work is progressing steadily. The John Henry is considered the richest of the group. The property known as the Plata Verde mining claims, in Shingle canyon, near Georgetown, was purchased last week by McGregor Bros., who intend treating the ore at their mill in Georgetown as soon as the roads permit of the hauling of ore from the claims. These mines are said to contain large bodies of low-grade ore that will pay handsomely if concentrated. A strike is reported upon the Caraboo mine at Fleming running high in native and sulphide of silver. Ore carrying native silver was struck upon this property several weeks ago when work was discontinued on account of the flow of water. The Peacock Mining Company, of which John A. Miller, of this city, is president, made its second shipment of ore to Denver yesterday. Mr. Miller has made arrangements with the railroad company for the erection of an ore-house alongside of the track in the northern part of the city. This will save the expense of handling the ore a second time, and will also be of great convenience in unloading. Mr. Miller expects soon to make arrangements for the erection of concentrating works at the mine. The final payment was made upon the Great American mine in the Swisshelm mountains on Saturday last, and the former owners, Messrs. Clark, Sherwood and Fleming, deeded the same to the Great American mining pool, of which J. F. Seldomridge, of Colorado Springs, Colorado, is president. This property promises to be one of the greatest producers of Arizona during the present year, and the company which purchased it feel justified in erecting works to treat the ores upon the ground, and are figuring with that view at present.

UTAH.

PARK CITY NOTES.—Park *Record*, Jan. 10: A number of small claims up Empire canyon show that the owners have been busy of late doing their annual assessment. The Crescent sampler did not get started until Tuesday, as the brake at the ore house tramway at the mine did not get repaired until the first of the week. Machinists were sent up from Salt Lake this week to repair the pumps and machinery in the Empire, and have everything in shape to start when orders arrive. Sinking was resumed at the Daly works yesterday and will be kept up as long as the water does not come in too fast. This will not interfere with the shipments from the Daly, but it is expected that they will be even heavier than they have been in the past. The new tunnel at the Lucky Bill has been driven in a distance of some 250 feet. Two shifts of men are busily at work on this tunnel and work is being pushed as rapidly as possible. The owners on this claim expect to cut the vein with the tunnel at 450 feet or thereabouts. A large sinking pump has been put in at the No. 3 shaft at a depth of 1,063 feet from the surface. It is intended as a relay for the Cornish pump and will be put in operation in the course of two or three days. A force of men are at work in the building at the mouth of the Ontario tunnel laying a stone foundation and fixing the necessary timbers for putting in a steam pump at that place. The pump is to be used for pumping water from the mouth of the flume into the new tank above the mill.

THE REED MINES.—These mines are situated about four or five miles southwest of Park City, at the head of White Pine canyon where it interlocks with Big Cottonwood canyon. They occupy the southern face of Pioneer mountain, which trends off northeast towards the Daly and Ontario mines, and occupy the same quartzite formation as do the above named mines. Dr. Reed made these locations years ago because of the similarity of geological and mineralogical formation to that of the Ontario mine. He has run nearly 2,000 feet of tunnels with a view to cut these veins at considerable depth, and thus to save hoisting works, pumps, etc. One tunnel enters at the base of the mountain, thus having in view the cutting of all the veins at that depth, and it is now in nearly 800 feet and well nigh up to the two largest veins. It has taken almost constant work for the past three years with the ordinary drill, to drive this length, because of the intense hardness of the rock, a compact, cement quartzite, ten times harder to drill than the ordinary quartzite and hence the slow progress made in the tunnel. Many miners express the opinion, that the principle vein of that locality will prove to be the southwest extension of the Daly and Ontario veins, as they lay upon the same course, but Dr. Reed does not express any opinion on that point, being satisfied with the strength and character of his veins even if entirely confined to that locality. They are in the same course and in the same formation as the Ontario.

WE CARRY IN STORE, DENVER:
Boston Belting Co.'s Rubber Belting, Abendroth & Root's Spiral Pipe, Iron Wheel-barrows, Ore Cars, and Buckets, Hoisting Engines, Etc., Etc.

FRASER & CHALMERS,
MINING MACHINERY,
ENGINES AND BOILERS.

WE KEEP IN STORE, DENVER:
Blake Crushers, Baker Blowers, Blake Steam Pumps, Hazard Wire Rope, Allison Artesian Well Casing, Eclipse Blowers, Frue Vanners.

MACHINERY for SYSTEMATIC MILLING, SMELTING, and CONCENTRATION of ORES.

PUMPING ENGINES —AND— MACHINERY, CORNISH PUMPS.

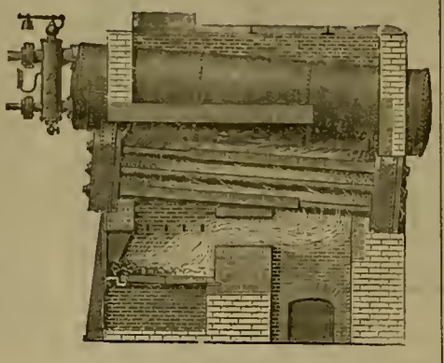
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

GOLD QUARTZ and PLACER MINERS.

Silver Plated

AMALGAMATING PLATES,

For Saving Gold.

First Premium Awarded at Mechanics' Fair, 1884.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought or gold separated for low percentage of result.

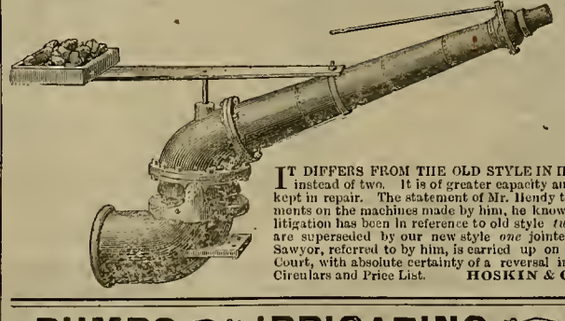
Sheet Metals of all kinds perforated for Flour and Rice Mills, Grain and Malt Driers, Furnaces, Chess, Cement and Smut Mills, Separators, Revolving and Shot Screens, Stamp Batteries, and all kinds of Mining and Milling Machinery. Inventor and manufacturer of the Celebrated Slot Cut and Slot Punched Screens. Mining Screens a Specialty, from No. 1 to 15 (fine).

☞ Orders Promptly Executed.



THE CUT REPRESENTS OUR

IMPROVED

HYDRAULIC

MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. ☞ Send for Circulars and Price List. HOSKIN & CO., Marysville, Cal.

Mining Share Market.

The market for mining stocks still continues in a dull condition. The Comstock mines are all prospecting but nothing of value has been found of late. At the north-end mines they are now doing exploring works in the Sierra Nevada, Union Con. and Mexican at various points from the 2300 to the 2700 level. The Ophir Folks are about opening out the old 500 level, where is a good deal of ground that will pay to work over. In the early days when it cost $50 to work a ton of rock, ore that did not look very rich was left standing, and the miners went on down in search of a place where all would be pure silver. The Crown Point, Belcher, Yellow Jacket and other Gold Hill mines are yielding the usual quantity of ore, and the mills on the Carson river are kept running to their full capacity. The Alta folks are finding some very good quartz to the eastward on their 1350 level.

Bullion Shipments.

King, Jan. 11, $18,541; Alhambra, 1, $22,516; Argus, 10, $11,396; Monitor, 10, $7,455; Ontario, 7, $17,268; Christy, 7, $4,268; Hanauer, 7, $5,450; Crescent, 7, $7,250; Queen of the Hills, 8, $6,500; Hanauer, 8, $65,000; Germania, 10, $6,597; Hanauer, 11, $5,300; Minnie Moore, 11, $7,160; Navajo, 12, $14,000.

TIMIDITY OF MINE OWNERS.—Most people get scared very easily when they have invested their money. This is particularly true as regards mining, and many of the disasters which have crippled our great industry are owing to this fact. It has been the case over and again that a company of men have selected and purchased a property, putting in so much for development. The money has been used up and more called for, when a certain proportion of the company invariably became scared and refused to furnish another dollar. Result, work is stopped—perhaps at a critical time—and a long quarrel is indulged in, one portion of the gentlemen backing out and the other portion trying to pull them in again. After considerable time one crowd contemptuously throws away what it has put in and abandons the mine; about that time the remaining gentlemen begin to shake in their boots, quibble, back and fill, and at last give the whole thing up. This thing has occurred in every camp in the whole Rocky Mountain section and the only reason for it is this natural timidity where money matters are concerned. If men would only select good properties, using care and employing all the means at command and then go into working and developing energetically and fearlessly, much trouble would be saved and the results would be almost universally favorable.—*Rocky Mountain Mining Review.*

THE syndicate formed to organize an American exhibition in London, which will be opened in May 1886, has been merged into a private company with $500,000 capital. Lord Ronald Gower, who recently visited America, is chairman of the new convention.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JANUARY 6, 1885.

310,244.—TYPE WRITING MACHINE—E. S. Belden, S. F.

310,261.—FEED RACK—W. S. Downing, Half Moon Bay, Cal.

310,397.—CLUTCH FOR CABLE R. R.—N. A. Fisher, Sacramento, Cal.

310,268.—CAN FILLING MACHINE—J. J. Gorman, Temescal, Cal.

310,274.—COUPLING HOOK AND LOOPS—Harris & Baltzly, Hill's Ferry, Cal.

310,296.—MORTAR BED FOR STAMP BATTERIES—Massu & Fernandez, Mazatlan, Mexico.

310,310.—CUT OFF VALVE GEAR—John B. Pitchford, S. F.

310,316.—HARVESTER—Jas. W. Reams, Suisun, Cal.

310,231.—HORSE SHOE NAIL—J. C. Simpson, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TYPE WRITING MACHINE.—Edwin S. Belden, S. F. No. 310,244. Dated Jan. 6, 1884. This improvement in type-writers consists in a combination of devices. The object is to give as much room or space to each letter or character as it requires approximately, and not have each letter have a certain space, as now, without regard to the size of letter.

HARVESTER.—James W. Reams, Napa. No. 310,316. Dated Jan. 6, 1885. This patent covers improvements in headers, and the improvements have for their object the lightening of labor of both man and beast, by reason of the best means for effectively operating the machine with the least exercise of power. They consist generally, of various mechanisms and arrangements of parts, having in view the operation of the cutter or knife, and the handling of the machine.

FEED RACK AND MANGER.—Wm. S. Downing, Half Moon Bay, San Mateo Co.; assignor of one-half to Geo. H. Walker, S. F. No. 310,261. Dated Jan. 6, 1885. This combined feed rack and manger consists in a peculiar construction and arrangement of devices. The feed rack and manger has corner-posts, with cross-pieces at top and bottom, a floor, with strips fastened to it, upwardly flaring slats, secured to cross-pieces and strips, and a siding having a flaring top or rim.

LOCK.—George W. Roberts, Walla Walla, W. T. No. 310,084. Dated December 30, 1884. This invention relates to a new door-lock. It consists in a peculiar casing, having separate boxes or compartments, in one of which is contained a novel latch mechanism, said casing being let into the door and having flanges which overlap the adjacent edges of the door on both sides, and ears by which it can be secured. The object is to provide a strong and well-secured lock, having simple and effective mechanism.

COUPLING HOOK AND LOOP.—Chas. P. Harris and Stephen Baltzly, Hill's Ferry, Stanislaus Co., Cal., No. 310,274. Dated Jan. 6, 1885. This coupling hook and loop consists in a bar, having a hook at each end and a loop at each side. A spring guard spans the space between the adjacent ends of the hooks, to prevent any interference with them. The object is to provide a simple and effective device for general coupling purposes, but especially for use in coupling together the fifth-chains and stretcher-chains by which teams of mules or horses are hitched together for heavy hauling.

CUT-OFF VALVE GEAR.—John B. Pitchford, assignor of one-half to W. T. Garratt, S. F. No. 310,310. Dated Jan. 6, 1885. This relates to mechanism by which steam may be cut off after the valve has been opened to admit it to an engine cylinder, and the speed of the engine regulated to suit the work to be done. It consists of an equalizing arm or lever, which is so connected with the valve-stem of an engine that movement can be imparted to the valve from two different sources at the same or at different times, as may be required, for the purpose of opening and closing the valves and admitting and cutting off steam to suit the load of the engine. The invention is specially applicable to the independent, double-ported steam-valves of the Corliss type, as the movement required is much less than with a slide-valve, and the cut-off can take place in one valve at any time without affecting the valve at the other end of the cylinder. When used with a single slide-valve it is less effective, for the reason that it requires too great a travel of the valve, and consequently a large movement of the cam, and there is also a tendency to choke the exhaust passage.

Market Reports.

Lumber at Wholeeale.

The market has been moderately active, though receipts have been light of late. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $10; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF INCH LUMBER—No. 1 ½ inch surfaced, board measure, $40; No. 2 do do do, $39; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 (refuse) do do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surface l and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and 1x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates—Pine—Merchantable Rough, $15 ₱ M; Flooring, $24 20; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for pine, fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱ M ft, $38.50; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $29.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.50; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1-½inch, ₱ M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

Retail quotations of Redwood are as follows:

ROUGH MERCHANTABLE—₱ M ft, $22.50; do Selected, $27.50; do No. 2, $18.50; Surface, No. 1 and Rough Clear, $40; do, 1x8, $37.50; do, No. 2, $30; Rustic, No. 1, 1x8, $37.50; do, No. 1, 1x10, $40; do, No. 2, $35; do, under 10ft, $35; T and G Redwood, 1x4, 1¼x4 and 1¼x6, $40; do do, 6-inch, 12 ft and over, $37.50; do do do, 7 to 11 ft, $32.5; do do do, under 7 ft, $30; do do do, No. 2, $30; do do, Beaded, 12 ft and over, $40; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; Half-inch Surface, $32.50; Pickets, Fancy, $30; do, Rough, pointed, $20; do do, square, $17.50; Siding, ½-inch, $27.50; Battens, ½-inch, per lineal ft, 1c; Shingles, ₱ M, $2.50; Shakes, Split, $11; do, Sawed, $12; Posts, per piece, 13c; Dressed Boards, ₱ M ft, $25.

On a credit of 60 days or less, or a discount of two (2) per cent for cash only. On all credits exceeding 60 days' time, not less than one(1)per cent per month to be added.

Under the rules of the Exchange, no "lump" sum will be given on any bill of lumber.

Nails.

We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.75: 8d and 9d, $3.00; 6d and 7d, $3.25 4d and 5d, $3.50; 3d, $4.25; 2d, $5.50.

BARRELS.—¾ inch, $6.75; ⅞ inch, $5.75; 1 inch, $5.25; 1¼ inch, $4.50; 1½ inch, $4.25; 1¾ inch, $3.75; 1½ inch, $3.50.

LINING.—¾ inch, $7.25; ⅞ inch, $8.75.

TOBACCO.—10d, $3.25 8d, $3.50; 6d to 7d, $3.75.

CLINCH.—6d to 30d, $4.50.

SLATING.—5d, $3.75; 4d, $3.75; 3d, $4.50; 2d, $5.75.

FINISHING.—2d, 1 inch, $8.75; 3d, 1¼ inch, $6.75; 4d, 1½ to 1¾ inch, $4.50; 6d, 2 inch, $4.25; 8d, 2½ inch, $4.00; 10d, in ch and over, $3.75.

CASING AND BOX.—10d to 30d, $3.50; 8d, $3.75; 6d, $8.00; 4d, $4.25; 3d, $5.25.

FINE BLUED.—4d, $4.50; 3d, $5.75; 2d, $6.50.

CUT SPIKES.—All sizes, $3.00.

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Materlal.

Lime, per barrel, $1.50@$1.60. Plaster, $2.75–3.00. Eastern Plaster, $3.00–3.25. Rosendale Cement, $2.25–2.75. Portland Cement, $3.50–3.75. Fire Brick, per 1,000, $40 @ $45, according to brand; hard, $10.00@$12,00; red, $8.00@$8.50; soft, $7.50; face, $30.00.

IN starting up the new hydraulic pump on the Comstock this week, it was no small job to make everything perfect, even after all connections were made. Thus, in filling the supply pipes, as the water was turned in, workmen began at the bottom and tightened every joint, where there was even the smallest leak, tamping with metal every cbink and hole, though some were not larger than the smallest needle.

THE difficulty between the employes and management of the Old Dominion Copper Co., Arizona, has been settled. Miners are to receive $3.50, and surface men, $3 per day.

A LEADING business firm in Salt Lake City recently purchased for $50,000, an interest in the gold-bearing gravel mines of Godbe & Co., at Osceola, Novada.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissnes taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here aud at Washington; Examinations made of Assignments recorded in Washington; Examinatioos ordered and reported hy Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate hranch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the varions inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Iuventors are found among our most steadfast friends and patrons, who fully apprcciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introdnction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which graut Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, Britisb India, Saxony, British Colnmbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European conntries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and cbanges of foreign patent laws—agents wbo are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than tbose of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of tbe country) SOONER than other agents.

The principal portion of the patent business of tbis coast bas been done, and is still being donc, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most invcntions discovered here than any othcr agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to prcserve aecrecy in all confidential matters, and applicants for patents can rest assured that tbeir communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast bas familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we bave of previous applicants which will interfere witb tbeir obtaining a patent.

We invite tbe acqnaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mntual gain. Parties in douht in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to tbem from a short call at our office.

Remittances of money, made by individual Inventors to the Government, sometimes miscarry, and it bas repeatedly bappened tbat applicants have not only lost tbeir money, but their invontions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agenoy.

Engravings.

We bave superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and otber printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 252 Market Street. Elevator, 12 Front St., S. F.

The World's Industrial and Cotton Centennial Exposition

Will be open for Six Months, beginning 16th day of December, 1884.

The display will embrace such a varied and comprehensive collection of the works of nature and art as it is possible for human enterprise to gather.

From the applications already received and entries made, the magnitude of the oxhibit will exceed that of any Exposition ever held.

The exhibits of the Departments of the General Government, for which $300,000 was appropriated by Congress, will be the largest and most complete ever made. These exhibits, in conjunction with the State and Territorial Collective Exhibits and Educational display, will occupy the full space of the second largest building of the Exposition—one of the very largest ever erected—885 feet by 565 feet.

The displays in the Horticultural department, in Agriculture and in the Live Stock department, will be of qual, if not greater, magnitude than if separate and distinctive exhibitions were given.

The Mexican and Central American Exhibits will possess unusual interest from their variety, uniqueness and historical value.

In the line of Manufactures and Arts, and in natural products, the Exposition will be memorable—excelling all previous efforts.

The principal structures of the Exposition are:

The Main Building—1,378x005 feet—the largest ever erected. To Machinery Hall, which forms a portion of the Main Building, and is 1,378 feet long by 300 feet wide, an extension of 350x120 feet has been added for the special uses of Factories and Mills' Machinery, making Machinery Hall 1,728 feet long by a width of 300 feet—nearly its whole length.

The U. S. and State Exhibits, 885x565 feet.

The Horticultural Hall, 600 feet long by 194 feet wide, in center.

The Art Gallery, 250x100 feet.

The Mexican National Exhibit, Octagonal, 80 feet cross section.

The Mexican National Headquarters, 300x100.

The Grand Rapids (Mich.) Furniture Pavilion, 172x172 feet.

Saw Mill Buildings, 600 feet long.

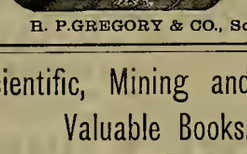
Live Stock Quarters and various other minor Buildings.

The Exposition grounds lie between St. Charles Avenue and the left bank of the Mississippi River. They are reached by five different lines of street railways, two of steam, and by all classes of water transportation.

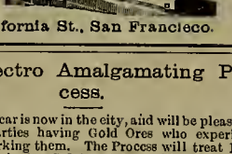
Accommodations for fifty thousand transient people have been listed—rates and character determined and recorded. The prices will range from one to three dollars per day, according to the character of accommodation provided.

Railroad transportation promises to be at much lower rates than ever before secured. The leading lines of the country have already arranged their schedules to this effect, and publication is only delayed in order to have it complete.

Send for Catalogue and Prices.



ATLAS ENGINE WORKS
INDIANAPOLIS, IND., U. S. A.
MANUFACTURERS OF
STEAM ENGINES & BOILERS.
Carry Engines and Boilers in Stock for Immediate delivery.



H. P. GREGORY & CO., Sole Agents, 2 and 4 California St., San Francisco.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHO. SALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Milluan, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print It also abounds throughout with plans and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free.

HEALD'S COLLEGE GRADUATES.—The following is a list of graduates of Heald's Business College for the term ending Decemher 31, 1884: John H. Feuss, F. E. Browning, A. J. Bailly, Fred. R. Kentley, Charles H. Kerr, A. G. Griffin, Miss Mamie Week, Henry E. Holmes, D. J. Paddock, Lambert Kahn, William Sutton, Thomas F. Murray, D. Guggenhime, Philip Lux, Augustin Pina, Thomas F. Meherin, city; John B. Danis, Norman, Cal.; C. F. Day, Woodland; Robert C. Woodworth, Los Angeles; H. H. Smith, Colusa; A. E. Damhacher, Columhia; L. H. Grunig, Knight's Landing; A. Martin, Oakland; Miss Lettie A. Howard, Reno; B. M. Wood, Ventura; R. R. Somerville, Napa Junction; Nelson O. Powers, Oakland; E. I. Collier, Virginia City, M. T.; Miss N. J. Cabanis, Los Angeles; Ole Olsen, Napa; George Waldo Burgess, E. C. Bruns, Honolulu, S. I.; G. E. Schilling, Grand Island; W. E. Bailey, Anaheim; Michael C. Lasky, Lone Pine, Cal.; E. E. Hall, Maine; Burnside McCord, Bakersfield; Louis P. Dallidet, San Luis Obispo; Albert H. Trathen, Dutch Flat; Harmon H. Edmonds, Woodland; W. P. Geary, Oakland; A. H. Long, Gilroy.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE Eastern railroad men declare that the sleeping-car porters are the only men who now make money out of the passenger traffic.

Carr's Electro Amalgamating Process.

Mr. Samuel Bear is now in the city, and will be pleased to confer with parties having Gold Ores who experience difficulty in working them. The Process will treat Free-Milling Ores, and also Sulphuret Ores without roasting, and recover a high percentage at no greater cost than by plate method. All those interested will find it beneficial to examine the process. Liberal inducements offered. Letters addressed to SAMUEL BEAR, Box No. 1, "Mining and Scientific Press" Office, San Francisco, will receive his attention for interview.

ASSESSMENT NOTICE.

Fremont Mining and Milling Company.—Location of principal place of business, San Francisco, Cal. Location of works, Amador county, near Drytown, Cal.

NOTICE is hereby given that at a meeting of the Trustees, held on the twenty ninth day of December, 1884, an assessment (No. 1) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secrtary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourth day of February, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday the twenty-seventh day of February, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Sec'y.

OFFICE—No. 402 Front St., Room 8, San Francisco, Cal.

DIVIDEND NOTICE.

San Francisco Savings Union,

532 California Street, cor. Webb.

For the half year ending with December, 31, 1884, a dividend has been declared at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum on term deposits, and three and six-tenths (3 6-10) per cent per annum on ordinary deposits, free of taxes, payable on and after Friday, January 2, 1885.

LOVELL WHITE, Cashier.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

Patent Agency.
[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

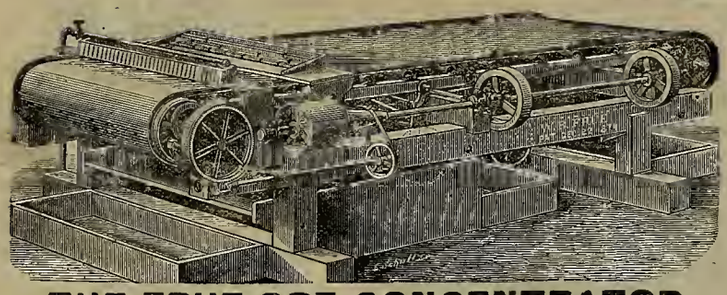
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

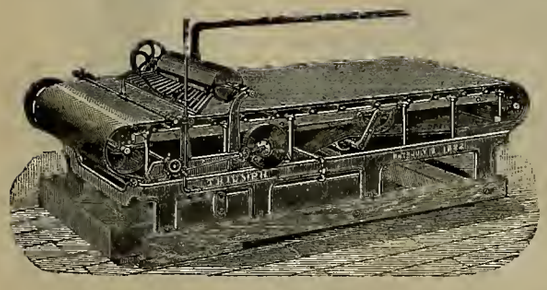
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue' Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

ANNUAL MINING REVIEW—TWENTY-FOUR PAGES.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JANUARY 24, 1885.

VOLUME XLXX. Number 4.

Movable Point for Drill-Pump in Shaft Sinking.

Mr. James E. Mills, of Quincy, Plumas county, in the work of exploring certain gold-bearing grounds in the American Valley in that county, found it necessary to sink a shaft through loose materials, containing in some layers large quantities of water, and was compelled to devise a new method which has proved successful. The excavating was almost wholly done by a modification of the sand-pump used in working artesian wells, which hecalls the drill-pump. This drill-pump could not have a diameter near to that of the shaft, like the sand pump of artesian wells, nor could it extend across the shaft so as to be brought to bear on the whole area of the bottom hy being turned around. It was therefor hung from a movable point so that its position could be shifted, and it could be placed over and dropped on to any part of the bottom of the shaft.

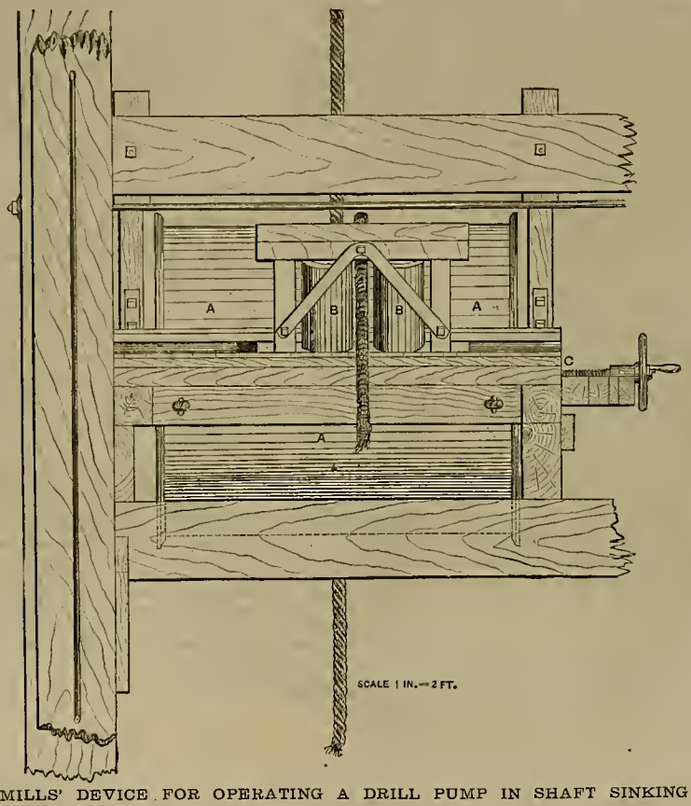
It is not our purpose on this occasion to describe the whole process of shaft sinking by Mr. Mill's method, which, however, it is our intention to do shortly. In this number of the PRESS we shall briefly describe the method of hanging the drill from the movable point.

This could hardly he accomplished with the walking beam ordinarily in use in artesian well boring, and the drill rope therefore, instead of being suspended from such a beam was connected through the clamp and temper-screw with another rope, which was attached by a loose wooden eye to the wrist pin of the gear wheel through which the drilling motion was imparted to the tools. Such a connecting rope is in common use in sinking small artesian wells by horse-power, but it passes over a sheave fixed in position.

This latter rope, on its way to the gear-wheel passed over a rolling horizontal drum A, shown in the engraving, and between two vertical rollers B. The drum could be moved foward by a winch, and run back by a weight, and the vertical rollers could be moved to right or left by a screw C, and so the point of suspension of the tools could be placed over any part of the flow of the shaft, where the drill pump was to work. The hoisting frame and machinery were the same as used for ordinary hoisting and pumping.

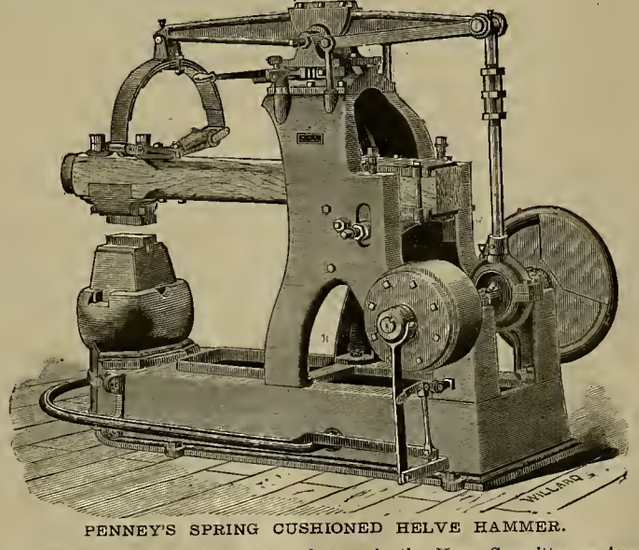
The tools were let down and the connecting rope attached by a clamp, and put into place by moving the drum and rollers, the main rope slackened above the clamp, and the machinery started, giving the lift-and-drop motion to the tools. When the drill pump was loaded, the connecting rope was unclamped from the main rope, and disconnected with its driving wheel by slipping the wooden eye from the wrist-pin, the drum moved back, the tools raised and the drill pump emptied.

SIMPSON'S COMPRESSION LUBRICATOR.—This is a sight drop luhricator for journals and hearings of all kinds. The engraving which appears in the advertisement in another column shows its appearance. Constant and regular lubricators is indispensable to the economical working of machinery. The claims for this luhricator are economy in use of oil, a guard against a hot journal, and a constant regular flow, drop by drop, which can be seen through the peek holes. It is so constructed that grease or oil can be used in it to great advantage because in works at any angle. The advantage claimed for this cup over other cups made for grease or compound is this: It is not necessary to wait for heat to move the grease, for that is a poor way of supplying the journal, from the fact that when the journal becomes hot enough to melt the grease in the cup it is too hot to retain it, and it runs off and leaves the journal without a lubricator, or the heat melts the grease around the rod and leaves the rest sticking to the sides of the cup; or the rod becomes stuck in the grease and don't touch the journal. The box and cup must become hot enough to start the grease before it will run down to the journal. It is considered a dangerous way to rely on heat to supply the journals with lubrication. This lubricator is provided with a valve in the shank that yields when the pressure is applied, and goes back to its place when the desired amount of grease has passed out. This lubricator is also made without the valve for hard grease, if desired.



MILLS' DEVICE FOR OPERATING A DRILL PUMP IN SHAFT SINKING

THE Indian Appropriation bill, as agreed upon by the House Committee on Appropriations, provides an appropriation of $5,664,136. The estimates amounted to $7,328,049. The appropriations made last session of Congress for the present fiscal year were $3,589,493.



PENNEY'S SPRING CUSHIONED HELVE HAMMER.

Penney's Cushioned Helve Hammer.

The hammer here illustrated is from new designs, and with several very important improvements. It is intended for the heaviest work, and to endure the abuse that such machines are subjected to. It is built entirely of iron and steel, with the exception of the helve; very strong and substantial, yet not cumbersome in working, but is easily handled, and for convenience of adjustment is unsurpassed. This machine has stood the test for years, and has never failed of giving satisfaction when fairly tested. It is still growing in favor as it becomes known to manufacturers, on account of its substantial make, quantity and quality of work, and facility of operation.

The helve is hung upon two adjustable hardened steel centers. It derives its motion from a broad eccentric on driving shaft, all perfectly fitted up so that they run almost entirely free from friction. The husk containing the helve, can be easily raised or lowered to admit of dies, varying an inch or more in thickness, without shimming them up. The anvil block and its foundation, are separate from the hammer proper, and the entire jar and concussion of the blow, is received on the anvil alone, relieving all other parts of the strain which they would otherwise sustain. The hammer head is cast steel, and is very long, in order to give good support to the helve.

The advantage of this hammer is the arrangement for changing the length of the stroke while the hammer is in motion, by a lever which changes the fulcrum of the beam on top of the hammer.

The speed is regulated by a gentle pressure on the treadle by the foot, which works a cone-shaped, paper friction running in the loose pulley. The speed is governed according to the pressure applied to the treadle, so that the hammer is completely under the control of the operator. They strike the most perfectly accurate, powerful and elastic blow that can be given. They are adapted to every kind of forging and they never get out of order. The Berry & Place Machine Co., 12 California St., in this city, are sole agents for this coast.

THE immigration by the Northern Pacific Railroad during 1884 was 13,263. This includes intending settlers in the East to points in Oregon and Washington Territory, west of Spokane Falls. The heaviest months were: March, 2,415; April, 2,468; May, 1,741. It is estimated that the immigration by steamer from California, and by team into Eastern and Southern Oregon is about equal to the above figures, making one year's immigration fully 25,000.

THE Union Pacific system consists of 4,748 miles of road under the full management of the company, and enough more in which the company has a controlling interest to bring the entire system up to 5,670 miles, making it the most extensive railway system in the hands of one company in America.

TIN.—We have secured several samples of tin ore, and a small bar of tin from the new Dakota mines, together with a description of the tin mining region, from Mr. Mark R. Hydliff, of Bear Gulch, D. T. We shall refer more fully to the subject next week.

DURING the last year 320,800 steerage passengers and 59,500 cabin passengers landed in New York city.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

The Mineral Belt of Amador County.

EDITORS PRESS:—In the PRESS of Nov. 29th and Dec. 13th, 1884, I gave you and your legion of readers a description of the mineral belt of Amador county in general. I now continue this subject by giving you the separate or different mining claims, or some of them at least, in this southern portion of the county as they are to-day, and as I found each and every one of them when I visited them and their respective owners since my last article or communication. I will commence with the extreme southern mine at the bank of the Mokelumne river, and proceed in their regular order as they come, going north on this mineral belt at least as far as Jackson and the Zeile mines at that place. First comes

The Farrall Mine,

As it is called. This runs to the above river (Mokelumne) and is 1500 by 600 feet. The hill, or mountain, is a steep one, and a regular ascent for 1000 feet on the surface of the ground. There are two tunnels run into this claim of 100 feet, and 300 or more feet in length, two-thirds of the way up the hill. There are also upon the level or top of the hill some two or three shafts of from 60 to 100 feet each deep, in and from which good paying and milling quartz has been taken, some of which yet lays on the dumps. One of these shafts is a large double track incline following the ledge and timbered very nicely and most substantially with sawed square timber of about 8 by 10 or more inches square; the ledge is well defined and carries paying quartz rock about from the top of the ground. The general lay of the ground in this claim is perhaps one of the finest and best to be found along or upon this mineral belt, as the mountain is one unbroken hill from the river bank all the way up, and the finest site for mills on the river bank to be found anywhere; and as the Amador ditch or canal runs (when built to there) upon the very top or summit of this mountain, you have in this mine one of the finest and greatest of water powers to be found anywhere, being 800 to 1000 feet above the river. This mine has lain almost idle for some years, owing to litigation which is, or was a few months ago, settled in the courts, and Mr. James Farrall is with perhaps others, the owner and occupant of this Number One mine. There are upon this mine a good blacksmith shop, a cabin or two and a building over the shaft. I will say that Mr. Farrall, like most of the other owners, is unable (financially) to develop this, which evidently will be one of the best quartz mines in the county, when $100,000 is properly expended in mining and milling machinery on the property. The next quartz mine on the north is what is known as the

McKenny Quartz Mine.

This is 600 by 1,300 feet. There the ground over the claim is considerably broken up by being cut up with small ravines through it, and the lead is scattered over the ground for 100 or more feet in places, whereas in the Farrall mine, above mentioned, nothing of this kind occurs, it being one unbroken, solid hill or mountain of ground, with the lead undisturbed. Half a dozen shafts have been sunk from 50 to 100 and 200 feet deep, and considerable quartz also has been taken out by a number of open cuts and by washing by hydraulic and sluices in this mine for several years past. Some rich places have been struck in working the mine, from which $50,000 or more has been taken. An 8-stamp quartz mill was at one time built at the river, and several thousand tons of rock crushed, which paid from $5 to $10 per ton. This mill was afterwards increased to 16 stamps, and ran upon the rock from this and the Hardenburgh mine, half or three-quarters of a mile above this. The same "Amador canal" or ditch also runs along and above this mine. Here, also, when one or two hundred thousand dollars are properly expended in mining and milling machinery, will be found a rich mine. Mr. Abraham McKenny, the owner, lives at Middle Bar, and keeps a store and public house. Next, and north of the McKenny mine, is the

Marlett Quartz Mine.

This is also 600 by 1,500 feet, and the ground is not so much broken up by small ravines as the last named mine. There is a tunnel of 200 feet run into this mine, with a shaft of 75 feet deep from the bottom of this tunnel, from which this fall and in the past few months considerable gold has been taken. The character of this lead or mine is the same as the last named mine, the quartz lead being less scattered. The water at first stopped the working of this mine. The quartz in it is not taken from the main lead, but only from small spurs, some 8 to 12 inches wide, and most of this quartz was of that black arsenite and iron character that is in the Mammoth mine, north of it, which is the great "bonanza" lead or mine here. Mr. Marlett has pounded up most of this rich black gold-bearing matter in a hand mortar, though some tons of paying quartz rock lie on the dump at the tunnel, which is also the case at the McKonny mine, last noticed. This mine, like the other, when it is worked properly and with $100,000 or more spent for mining and milling machinery, must prove a "bonanza" to those owning it and working it. Mr. John Marlett, the principal owner, with Mr. Sargent, lives also at Middle Bar, but, like all the other owners, is unable to properly work it.

I will send you further notes next week.

WELLINGTON.

Blackburn Mining District, Idaho Territory.

EDITORS PRESS:—Several mines in the Blackburn District, near little Lost River, Idaho, are proving very valuable. The Tyndall lode shows a continuous outcrop of ore and quartz for over four miles in length, and on the following claims there is a good showing of high-grade ore, viz.: The Ingersoll, Tyndall, Alice, Great Northern, Daisy Black and Combination. Carbonate ore has also been found on the Dixie, Silver Queen and Carbonate Queen.

There has not been much work done on these mines, but the showing of ore is very good for what has been done. The ore in all these claims appears to be of similar character, viz., galena and carbonate of lead and black copper. These ores assay in silver all the way from 25 to 2,500 ounces per ton. There are many thousand tons of such ore now in sight. The veins are wide, long, and stand nearly vertical. The country rock-wall rock of these lodes or veins is "quartzite" exclusively. There are other claims north and east of the Tyndall lode that are in a limestone formation, but these veins contain less silver than the ores found in the quartzite.

The quartzite stands on end, or nearly vertical, and the ore bodies go down very regularly and prove better in metal as depth is attained. A shaft on the combination is over a hundred feet deep, showing a great cap of iron; but carbonate and galena is making its appearance at the bottom. The ore at the Ingersoll is all carbonates of lead, galena and copper ore—very rich in silver. One shaft is 75 feet deep in carbonate ore, and over a hundred feet of tunnelling shows the same kinds of ore, gray carbonate and galena. The Ingersoll is proving a genuine bonanza. The same can be said of the Daisy Black, Alice, Great Northern and Tyndall. These mines will produce a great deal of rich bullion when once properly worked. The camp is in great need of machinery, concentrators and a smelter. As soon as that is done it will require a railroad to move the bullion. When all the claims on the Tyndall Lode are fairly worked there will be a daily output of over "five hundred tons of lead-silver bullion." I say it can be done when fairly worked, and it can average that the year round. The ore is there and all that is needed is labor and machinery.

The climate of the Blackburn district is very mild, no deep snow, and never so cold as in those camps further north and of greater altitude. The Blackburn district includes a strip of country twenty-five miles long and about ten miles wide. It is on the west slope of the Carbonate Range, east of Little Lost River, Alturas Co., Idaho.

The soil at the sink of this river—Little Lost—is about like that around Boise City or Salt Lake City—very productive, and the finest vegetables and cereals grow and mature here as well as they do on the American bottom along the Mississippi. The Lost River region is destined to be a famous mining country in the near future. The lodes are large and most of the ore high grade—rich in silver. Mining operators can find no better place to take hold of good paying mines, than here. Properties can be had very reasonable, and many of them will pay a good dividend right from the start.

PROSPECTOR.

Tuolumne County Mining Interests.

EDITORS PRESS:—Although mining operations have been carried on very slowly during the past year, a great many new developments have been made, and the coming year will show a larger bullion product than for many years past. There is no county in the State of California where a good mine can be purchased on as easy terms and for so little money as in Tuolumne. To illustrate:

Johnnie Skae, of Sierra Nevada fame, came here scarcely a year ago for his health, more than with any intention of engaging in mining; but after a visit to the Buchanan mine was so favorably impressed with its prospects that he inquired the prices of undeveloped mines in that vicinity, expressing a wish to do a little prospecting. He was shown the Dead Horse mine by that genial-spirited and enterprising miner, Mr. John A. Davis. Mr. Sharwood, the owner of the Dead Horse, sold to Mr. Skae for $1,000. After ten months' work, the Dead Horse shows a 300-foot shaft with three levels run. All the rock taken out in running the levels has been hauled and milled, and shows the ore to average $25 a ton in free gold; the vein is over three feet thick. Mr. Quick, the gentlemanly superintendent, estimates that there is $125,000 in sight. The mine has so far paid its own way for all work done, and not one pound has been stoped.

The Buchanan Mining Company have struck their chute at a depth of 400 feet. They have a six-foot vein of $30 rock. The company will build a road as soon as the rains cease, and after hauling in their machinery will put up a 40-stamp mill.

A company unknown to the writer have bought a controlling interest in property owned by John Summers near Summersville, and will build a mill in the spring.

The Soulsby mine at Soulsbyville continues to hammer away. The mine has produced millions, is down over 800 feet, and its 20-stamp mill is kept steadily pounding away on forty dollar rock.

Long and Hampton's 10-stamp mill at Jacksonville is running on $4 rock. Their mine is on the great Mother lode. At a point where an enormous granite dyke intersects the vein there is a mass of material over seventy feet in width consisting of granite, quartz, slate and clay all mingled together. A pan taken anywhere from this mass shows quite a "tail" of heavy flour gold. It only costs one dollar a ton to mine and mill; two and a half tons are put through to the stamp. If it pays four dollars a ton it is a big thing, for there is enough to run 100 stamps for ten years already in sight. There are a dozen mines on the line of the Mother lode that prospect fully as well as this mine mentioned, which can be bought for a few thousand dollars per claim. If practical men with some money come here they can easily find good mines cheap and can make money in Tuolumne county; but inexperienced men, and men from the East, along with broken-down superintendents from Nevada, who never saw a gold mine, and who imagine that because they have succeeded in working silver mines, they can also work a gold mine without serving an apprenticeship, had better stay away; they are not wanted.

The Riverside mine and 20-stamp mill, near Columbia, will soon be started up under the management of that energetic, rattling miner, Jim Barrou, which means that it will be worked in style. The Alabama 48-stamp mill is running steadily. The Heslep mine, at Quartz Mountain, is running 20-stamps steadily on $9 rock. App & Co. have a 5-stamp mill running on good rock. Over 80 new stamp mills will be running in the county before summer is over. Pocket miners are all in good spirits. Sums ranging from $800 to $1,200 have been taken out near Sonora during the past month. It is reported the Mandich Bros. have taken out $30,000 during the past week from the Simouich claim, on Brown's Flat, which they are working on a lease. A piece of nearly pure gold, as large as an orange, was shown the writer, and said to have come from this "pocket." The piece bore the marks of a chisel, and is said to have been cut from a much larger chunk. E. L. Lang and W. R. Shaw are building a mill near Groveland. They have a continuous pay chute 1,200 feet long. Rock hauled to custom mill as a test paid $30 per ton.

Before another year, we will undoubtedly have direct communication by rail with San Francisco. At present all freight must be hauled on mule teams, 40 miles from Milton station. The Eagle mine, on the Mother lode, near Jacksonville, will soon be put in operation by Chas. W. Tozer. They had a 12-foot vein of $7 rock when the mine shut down over 20 years ago. In those days $7 rock was not considered profitable. Such things are being looked after at present. Abundant rain has fallen, and the mining outlook in Tuolumne county can be called very bright indeed.

MICKEY FREE.

Sonora, Tuolumne Co., Jan. 14, 1885.

Howells, Arizona.

EDITORS PRESS:—In No. 26, we read your request that the miners tell what they know about their camp. I have been a subscriber to your paper for over a year, and have often thought that it would be a good idea for miners to exchange ideas through the press. Big Bug, Lynx Creek and Turkey Creek districts have been almost at a standstill for the last year, yet there has been the usual amount of assessment work done. The Howell smelter has stood still, and there has been no incentive for the boys to get out ore, for there was no way to get it reduced to bullion. There is any amount of ore here that will run from $20 to $100 to the ton in gold and silver. We need the proper machinery to concentrate the ore, and this is a big field for capitalists to come in and put up suitable works. A good custom mill would have all it could do. This country is full of wood, water, timber and good low grade mines. We need a railroad. Freight is so high that it takes away all the profits, and our smelters are compelled to lie idle. Mr. Schofield and others are putting up a stamp mill and concentrators on Big Bug, and rumor has it that Mr. Whitcomb will put up another on Big Bug in the spring. Mr. Chase, of Pine Flat, Turkey creek district, put up two 10 stamp mills, and has gone East to get concentrators. The *Courier* informs us that the Mineral Belt Railroad will be built this year. Our Legislature meets on the 12th, and we are all waiting to see if they won't do something toward getting a railroad into Prescott. We have been snowed in all winter, so we are compelled to lie still, but hope that spring will open with a boom. The placer mines will have plenty of water this year. We are looking for a reduction in wages from $4 to $3 per day, and hope that board, provisions, transportation, etc., will come down also, and that miners, millmen and merchants will go in on the "live and let live" principle, and make 1885 a year of success for all.

A MINER.

Cottonwood District.

EDITORS PRESS:—In compliance with your request for mining facts for your "annual review," I send you a line on our Cottonwood District.

This camp is situated about 90 miles northeast of Reno, Nev., north of Pyramid lake, on the line between Washoe and Humboldt counties. It has been known for years that there was rich ore in the district, but no developments were made until about three years ago, and now there is not an incline or shaft 100 feet deep. There are a number of locations more or less prospected. The following are among the most promising: The Hornet, owned by Dr. F. R. Waggoner, and others of Reno, with an incline 85 feet, showing a three-foot vein for the full depth, carrying tetrahedrite ore giving high assays, from $100 to $2000, the whole fissure being a high milling proposition, mineral increasing with the ore in depth. Susceptible of being highly chloridized.

The next mine is the Besse—slightly developed, but gives high assays—even into the hundreds—from 400 to 500. It is on the same ledge of the Hornet. The Blackburn comes next in order on the same ledge, and is of high grade and has given good assays. Modoc and Pennsylvania are promising claims. Nature has done a great deal for Cottonwood. It has plenty of water for steam power, wood, &c. Nearby is a fine bed of salt—everything is such as to make mining easy, cheap and successful.

Our mines are true fissure and contact. Slate with granatite form the contact, the latter being foot-wall, I believe, of all the ledges. In these dull times manufacturing is at a standstill throughout the country. This certainly offers inducements for capital, east or west, almost unequaled on the coast. There are literally thousands of tons of ore on the surface that will pay well for milling

W.

Reno, Nev., Jan. 10th.

Sweetwater Mines.

EDITORS PRESS:—The shares of the Kentuck mine have in the last three or four days advanced from seven cents to 25 cents per share. An unknown party has agents trying to buy large blocks.

When the present economical management (Capt. Johns, Supt.,) took hold of the mine, it was thought to be exhausted, but now, after extracting 600 or 700 tons of ore and shipping $33,000 worth of bullion, it has several times that amount in sight. The last 50 tons of ore taken from the lowest workings, the 450 level, worked $72.30 per ton, most of which was stoped without blasting. The veins get softer as depth is attained.

The whim in tunnel No. 2, is 550 feet from the mouth of same; a shaft or winze is being sunk at that point and is now down 150 feet and is to be continued to a depth of 350 feet below the tunnel level.

Tunnel No. 2, now in 750 feet is gaining depth. As it advances it will gain a total depth of 600 feet on the vein, in 400 feet further.

Ore is being extracted from stopes above tunnel No. 2, and stored on the dump and in the mine. The company has at the mill and mine, an abundant stock of supplies to last all winter, and will, in the next four months, have ore reserves enough ahead, to meet a necessity long deferred, of getting the work of development sufficiently advanced to keep a large supply of ore ahead of mill.

The north end of the mine, some 1,200 or 1,500 feet, is all virgin ground, in which an ore body is likely to be encountered at any time, especially as the north extension (the Emm) has very rich ore on the 100-foot level.

Joseph Alcatras & Co. have relocated the Emm & Emm mine, at the south end of the McPatterson. It formerly belonged to O. F. Osborn, of the Los Angeles *Herald*. There is said to be considerable rich ore in sight.

There are three companies working all winter up Sweetwater canyon.

The assessment on the Kentuck is being paid rapidly.

R. T. S.

The Assay of Nickel and Cobalt.

EDITORS PRESS.—In several of my communications I have held out to your readers the hope or expectation of a new and comparatively simple assay for nickel and cobalt.

As the proprietors of this paper are also the publishers of my book on assaying, I deem it not impertinent to state that the promised process has been some time ready for publication, and will appear in the third part of the book, now in press. I prefer not to publish it in advance in your columns, leaving it to your discretion to do so after the issue of the book, should you think that desirable.

The book will also contain my new process for the assay of copper, both volumetrically and grairmetrically, a modified method for zinc, and one little known, though not of my devising, for arsenic.

The copper assay is not so expeditious as the method by potassium cyanide, but is free from certain defects which that has, and while it seems to be as accurate as electrolysis, is vastly less troublesome. Several of the methods in general use will also be given.

C. H. A.

MECHANICAL PROGRESS.

The Invention and History of Screws.

The screw is not, as many suppose, of modern origin, although it was not known to the ancient Egytians. The helix of the Greeks was the first thing known to be made in the form of a spiral, and was by them used in moving large, heavy bodies, and must have been constructed similiarly to our jack screws. It was invented by Archimedes, at Syracuse, about 250 years before the Christian era. He also used a similar device for the purpose of raising water. (This last invention has been used by the Egyptians since the Christian era.) History gives us no account of how Archimedes formed his spirals.

Another inventor and philosopher, who lived in the fourth century, tells how he made screws.

He used a template in the form of a right angle triangle, made from thin brass, which he wound around a cylinder, the edge of which he used as a guide to form the threads, after which the brass was removed. Of course this could not be done on very line screws.

Bessou, a Frenchman, in 1569, invented a lathe for cutting screws by the aid of a guide screw; and Hindly, an Englishman, improved it for use in watch making in 1740.

Ramsden, in 1776, invented a machine called a dividing engine, with which he made screws of a good quality.

Mandslay paid great attention to the manufacture of screws, and invented several machines for the purpose—but finally settled down to the stationary knife, or cutter and revolving rod. The rod revolved as in our modern lathes, and the cutting tool was fastened to a sliding plate, which was moved by a guide screw. This screw was made to revolve by belts and pulleys similar to some old lathes now in use. By changing the pulleys a different speed was given to the guide screw, and the screw was cut finer or coarser, as might be required.

From this sprung the gears now in use. Manslay at first made the guide screws of different sizes, and changed them instead of the pulleys, but this did not prove a success, as screws could be cut only tho same thread as the guide screw used.

To Manslay, more than any one else is Holtzapffel indebted for points in his lathe, which was in its day the best in use, and is still very much used. Holtzapffel wrote a treatise on the lathe in three volumes, which is still an authority. His lathe is used not only for the purpose of cutting screws, but for all kinds of fancy turning. There is or was not long since, one of them in this city.

The finest screw thread used in watches is 250 to tho inch. These are made by automatic machines, and without the aid of a magnifying glass no thread can be seen at all. It takes over a hundred thousand of these to weigh a pound.

We cannot recount the thousands of different uses to which screws are put, but it may be of interest to know that the watch which you carry in your pocket, if it has a compensating balance, has 44 screws, 22 of which are in the balance wheel; and if you have one of the best watches, these 22 screws are made of gold.

In the modern screw machine, different sizes of dies are used. Knight, in his Mechanical Dictionary, describes them as being stocked in a circular head, and such a one is selected and presented to the plank as may be of the size desired. It has also a rest with a transversely sliding tool post, whereby the screw may be cut off or dressed.

Automatic screw machines are now in use in all large factories. A company in Hartford, Conn., holds the principal patents on this kind of machinery.

There are various kinds of stocks and dies used for cutting screws, but as they are only used for special purposes or on a small scale, they require no particular mention. Their origin is unknown.—*Sewing Machine News.*

A New Process of Steel Making.

A patent has recently been granted to Mr. W. A. Otto Wuth, of Pittsburgh, for a new process of producing steel from wrought iron with plumbago, the steel produced being, it is claimed, of a high grade and substantially free from sulphur and phosphorus and containing a definite percentage of carbon. The process consists in making the steel from wrought iron that is practically free from phosphorus, sulphur and carbon by melting it on an open hearth in contact with a form of carbon which will not oxidize at the heat necessary to smelt the iron, but which will unite with the iron at that heat.

Any wrought iron which is sufficiently low in phosphorus may be used as the basis of this process, though muck bar, made according to a previous patent of Mr. Wuth, he preferred as being especially pure. The decarburized iron of the requisite purity is first cut into pieces of convenient length and placed in the hearth of the furnace in layers piled one above the other. Between each layer of iron is spread a thin stratum of plumbago, preferably in a pulverized condition, although it may be used in lumps. For this purpose the inventor employs the plumbago of commerce, but of good quality, containing about 98 per cent of carbon and two per cent of silica, with a trace of iron. The hearth of the furnace is charged with alternate layers of wrought iron and plumbago, until it is sufficiently full, the relative thickness of the layers depending upon the amount of carbon which it is desired that the resulting steel should contain.

If the iron were absolutely free from slag, and the plumbago were also absolutely pure carbon, then the proportions of the charge would be the same as the proportions of iron and carbon in the desired steel product; but as there is always more slag in muck bar (not, however, exceeding one per cent), and some silica in the plumbago, the proportions of which can be ascertained before the furnace is charged, the necessary allowance for these elements will have to be made, and the percentage of carbon can be regulated with great exactness, so as to produce steel, it is claimed, very nearly approaching to an ideal steel. The furnace being thus charged with muck bar and plumbago, the charge is melted in the usual way, and the operation further carried on as in the well-known open-hearth process. Before the melted metal is withdrawn from the furnace, a small and definite amount of spiegeleisen or ferromanganese is added. By this process Mr. Wuth says he has made several charges of steel of 12 tons each, containing as low as one-hundredth of 1 per cent of phosphorus, and that he will be able to produce any kind of fine steel that may be desired.

A WOODEN HAMMER FOR BENDING IRON.—A correspondent of the *Blacksmith and Wheelwright* writes that journal as follows: In a shop in this town where they make all sorts of heavy draft wagons a specialty, I saw recently a smith working on a fifth wheel. He lifted a long bar out of the fire at a glowing heat, and began filling it with hammer marks in trying to convert it into a circle. I let him get through his first heat, and then suggested if he would give me a condemned six-inch hub, an old spoke and a drawing-knife, I would give him a lesson in fifth wheel bending. The hub, spoke and drawing-knife were soon provided for me. I fitted the spoke in the hole of the hub, and thus had a wooden hammer. I took the other bar, raised my heats, and beat the fifth wheel with my wooden hammer, and turned the job over to the boss. He said, "Well done." Perhaps there are some others of the craft who are not acquainted with this "wrinkle."

THE WIRE AGE.—In history we have the golden age, the iron age, the age of brass, and other periods similarly marked. Future annalists may well describe the present period of our history as the wire age. In no part of the economy of our daily lives are we divorced from wire. It is our slave, and yet an ever present master. Sleeping, we repose on wire mattresses. Eating, we see foods that have passed through sieves, and which are sheltered from insect appetite by wire covers. Calling, we pull wires to ring curled wire gongs. Traveling, we are conveyed by cable or electric railways, hoisted by elevators hung on wires, and hurled over wire bridges. We announce our coming by telegraph or telephone wires, and we tread our way by night through streets lighted by means of electric cables. Across our fields are strung thousands of miles of barbed wire. Our clocks are set by wires, our watches are run by wires, our books are stitched with wires, our pictures are hung by wires, and our politics managed by wires.

BESSEMER STEEL NAILS can be made, it is reported, much more cheaply than iron nails, owing to the cheaper preliminary process in preparing the metal for making them. A few men can do what hundreds have been required to do heretofore. The complaint is made, that having a smoother surface than iron nails, those of steel have less grip on the surrounding material. But they have not yet been used extensively enough to test their value fully, and possibly some way of overcoming this objection—if it is a valid one—may be devised. Two establishments, one at Bellaire, Ohio, and the other at Worcester, Mass., are now manufacturing steel nail plate. A third is in process of erection.

PROF. CALVERT has recently made the interesting discovery, by practical tests, that the carbonates of potash and soda possess the same property of protecting iron and steel from rust as do those alkalies in a caustic state. Thus it is found that, if an iron blade be immersed in a solution of either of the above carbonates, it exercises so protective an action that that portion of the iron exposed to the influence of the damp atmospherie air does not oxidize, even after so extended a period as two years.

PECULIARITIES OF MANGANESE STEEL.—Manganese steel is very dense, tough and hard. It does not require to be forged or rolled to impart strength to it like most steel. It does not tarnish readily; magnet does not attract it. When brought to a white heat and plunged in water it turns soft and not hard. Its castings have very few flaws. It is made by pouring from 10 to 12 per cent of rich ferro-manganese into molten steel, and mixing the two together before the alloy is run off into ingots.

In the PRESS of Dec. 29th, page 386, in our article on "Calaveras county Resources," a line was made to read as follows: "These seams were generally from 12 to 20 or 30 feet wide." It should have read inches instead of feet.

SCIENTIFIC PROGRESS.

Influence of the Moon on the Earth.

The tides are caused mainly by the moon, as it were, catching hold of the water as the earth revolves around on its axis. This must cause friction on the earth as it revolves, and friction, as every one knows, causes loss of power. Suppose a wheel, with hair round its rim, like a circular brush, such as is used for hair brushing by machinery; if this brush be revolving rapidly, and we hold our hand ever so lightly on the hair, so that it is slightly rubbed backward as the wheel revolves, we can understand that the speed of the wheel will be gradually diminished, until at last it will be brought to a standstill, provided there is no additional power communicated to the wheel by machinery or hand, beyond what was given to set it spinning round. Now, this is somewhat analogous to what is happening to the earth in its rotation. There is reason to suppose that the action of the tides is slowly but surely lessening the speed of the earth's rotation, and consequently increasing the length of the day, and that this action will continue until the earth revolves on its own axis in the same time that the moon takes to revolve round the earth. Then the day, instead of being 24 hours, as now, will be about 28 days, and the earth will be exposed to the full blaze of the sun for about 14 days at a time. The change this will bring about on the face of the earth can hardly be exaggerated. All life, both animal and vegetable, will be destroyed; all water will be evaporated; the solid rocks will be scorched and cracked, and the whole world reduced to a dreary and barren wilderness. It is supposed by some that the moon has already passed through all this; hence, its shattered and bare looking surface. That the earth, being so much larger, has more quickly acted upon the oceans, which once were upon the moon's surface, and stopped almost entirely its revolution round its own axis, thus causing it to have a day equal to 28 of our days, and the heat of the sun has already done to it what in future ages it will do to the earth.—*Harper's Weekly.*

THE RIGIDITY OF THE EARTH.—Sir Wm. Thompson recently delivered a lecture in Hopkins Hall, Baltimore, on "The Rigidity of the Earth." The object of the lecture was to show that the hypothesis to which the geologists have so rigidly clung, that the interior of the earth is continuously liquid, is not true. The theory is based upon the assumption that the deeper down we bore the warmer the temperature, until finally, at the depth of about 50 or 60 miles from the surface, the increase being constant and at the rate so far as observed, the temperature is far above the boiling point. This the lecturer characterized as a very large assumption upon very small premises. He endeavored to show that the hypothesis of those geologists who contended that the earth has been habitable for millions and millions of years is contrary to known physical laws, and then showed that the rigidity of the earth, as demonstrated by the effect of the tides, could not be maintained if there was only a thin crust and a large liquid interior. The lecturer contended that the interior was not a continuous liquid mass, but probably consisted of mortared rocks, with limited spaces of liquid matter, so arranged as to support the exterior. Earthquakes he regarded as probably due to the falling in of solid matter, and their occurrence as evidence of this theory.

SCIENTIFIC DEDUCTIONS by the most profound investigators are not always to be implicitly trusted, as a member of the geological section of the American Association for the Advancement of Science at its late meeting found to his chagrin. It seems that Professor Williams, of Cornell University, read a paper on a geological topic, which was discussed by Profs. Hall and Claypole. The latter, in support of Prof. Williams, declared that the spirifer disjuncta and the spirifer mesostrialis, which are shells supposed to belong to different geological periods, exist side by side in the same rocks. Prof. Hall, who is State Geologist of New York, and is one of the foremost geologists of the world, asserted that Prof. Claypole's statements were erroneous, and very excitedly offered to eat his hat if such a rock were shown him, and give his coat and boots to the person making the exhibit. Prof. Williams took the first train to Cornell, and from that place expressed a box to Prof. Hall, which arrived before the adjournment of the Association, and when opened was found to contain a rock in which the two spirifers were undeniably present. It is not known whether the discomfited Professor has actually made a meal of his hat, but he has been called upon to surrender his coat and boots to the triumphant discoverer of the rare, but not impossible, combination.—*The Iron Age.*

NATURE'S FORCE PUMPS.—Trees and plants are continually pumping up water through every root and every part of the stem and branches, to discharge it through the leaves into the air as vapor, or, if the temperature be low, in drops called dew. This shows the need of all plants for moisture at the roots, and the impropriety of leaving weeds to pump that moisture away from the plants or trees upon whose produce the husbandman depends for a living. Grass is an inveterate pumper, as may be seen from the general dryness of the ground beneath it, and there cannot be a doubt of the injury it does to fruit trees when growing over their roots. Some plants and trees pump far more vigorously than others, and these are of great use in wet soils. The eucalyptus and sunflower are among the most vigorous agents for the transfer of water from the soil to the air, and it is in this way mainly that they purify malarious regions. A eucalyptus tree of good size near a well will, it is said, as soon as it gets its roots into the well, pump it dry and keep it so. This tree has greatly mitigated, if not banished, the marsh fevers of the low, undrainable Campagna of Rome.—*Witness.*

ANIMAL REGENERATION.—The power of regenerating lost parts in animals is greatest where the organization is the least perfect, and while the animal is in the young or larval state. It is really a process of budding. Certain worms may be cut into several pieces, and each part will regain what is needed to complete the mangled organism. The star fish can reproduce its arms, the snail its tentacles, the lobster its claws, the fish its fins, the spider its legs and the lizard its tail. As closely related to the above may be cited the fact that Professor Mosoley, of the famous Challenger expedition around the world, has discovered eyes in the shells of chitonidæ, no less than 11,000 being contained in the shell of a single animal. As the shell grows larger, new eyes are formed. No other molluskas have any sense organs in their shells, but the chitonidæ, in addition to eyes, have elaborate organs of touch permeating their shells.

MEASURING THE MOTIVE POWER OF THE HUMAN BODY.—Dr Marey, of Paris, read a paper on this subject at the International Congress of Hygiene, in which he described the ingenious manner in which he had succeeded in measuring the motive power of the human body in its every movement. Planks, with India rubber coils underneath, recorded, by expelling the air they contained, the exact pressure of the foot. The motions were measured; and photographs, taken in one thousandth of a second, recorded every attitude during a leap, and where and when the effort was greatest. By such studies Dr. Marey had been able to prove that something was gained in the power of walking in quickening the step from forty to seventy-five steps per minute. But the latter figure was the extreme limit; with a greater number of steps, power would only be lost instead of gained.

THE POWER OF RAIN.—In estimating the motive power of rain, Prof. Tait calculates that the amount of force required to convert one pound of water from the sea or from moist earth into vapor is equal to the force exerted during one-half hour by a horse. This is given out again in the form of heat as it condenses, and the pound of water falling as rain would cover a square foot or ground to the depth of rather less than one-fifth of an inch. Thus one fifth of an inch of rain represents a horse-power for half an hour on every square foot; or, on a square mile, about a million horse-power for 14 hours. A million horses would barely have standing room on a square mile.

FOR SCIENTIFIC UTILIZATION.—The Washington Monument, like Bunker Hill Monument in years past, is to be used for making experiments in aid of science. Experiments regarding falling bodies will be made, and the first proposed is to see whether a renowned baseball catcher can catch a ball thrown from its top. It is roughly calculated that the ball would take five and a half seconds to descend, and at the bottom would be going at the rate of 180 feet per second, or in the neighborhood of two miles per minute. The resistance to be offered by the person who attempts to catch it would be only 110 pounds, or, in other words, he would have to put forth enough strength to lift that weight.

MEASURING THE TEMPERATURE BY TELEPHONE.—A plan of accurately measuring the temperature of a distant station by telephone has been described by Dr. R. Lenz. Two wires—one of silver and one of iron, or one of antimony and one of bismuth—connect the observer with the distant place, and any variation in the end loops of the wires, as regards temperature, causes a sound in a telephone, which ceases when the temperature at the observer's loop is brought to the same point as that of the opposite end, which may be miles away.

ONLY ONE COLORING SUBSTANCE IN FLOWERS.—A student of the colors of flowers, M. Schnetzler, contends that only one coloring substance exists in plants, and that the various colors of flowers are due simply to the modifications made in this substance by the acids or alkalines contained in the plants themselves.

THE DISTRIBUTION OF PLANTS.—A French scientist, Mons. F. Krasen, has sought to demonstrate that certain anomalies in the distribution of plants, according to altitude, must be due to a comparatively recent change in the elevation of the mountains on which they grow.

JOINING SEVERAL NERVES.—Two cases of the successful joining of divided nerves have been reported to the Paris Academy of Scienees, function being restored in one case to a nerve which had been divided for 15 years.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

As so much space in this number of the PRESS is devoted to a general summary of mining work on the Pacific Coast for the past year, we have condensed our usual summary of current mining news to one page, instead of two.—EDITORS PRESS.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Jan. 17: The Mahoney is once more the scene of an annoying accident. The barrel of the pump broke at the 500-ft level, rendering the whole pumping machinery inoperative. A new one was ordered from Knight's foundry immediately, which they hope to get in position in a day or two. The water is very strong, but fortunately the Lincoln pump is working nicely, and will probably be able to keep the water from rising above the 500-ft level.

THE NEW YORK MINE.—Amador *Dispatch*, Jan. This mine which is located about three miles from Jackson is being developed in a lively manner under the management of Mr. W. G. Anderson. Two men are at work in the shaft and four on the flume. The shaft is now down about 90 ft in all at which depth the ledge is from 12 to 14 ft wide. The rock thus far taken out looks well and shows considerable free gold and there is every indication that it will prove to be a valuable mine when fully developed.

CONTRACT LET.—The contract to run the big tunnel at Middle Bar 500 ft further was awarded to C. Fuller and B. Claich, for $10.50 per foot, contractors to find powder, candles and fuse, and to work three shifts of not less than four men each. The tunnel is now in over 1700 ft. The contract price is considered very low, considering the distance the rock has to be run out.

MAMMOTH.—At this mine the 10-stamp mill has kept steadily at work for some time. There is plenty of ore in the mine to keep the mill running constantly. The greatest difficulty experienced is on account of lack of ventilation.

MISCELLANEOUS.—Messrs. Nevills and Nichols, the owners of the Moore mine, are expecting to start work on that property at once. The Huntington roller quartz mill, for the Morgan and Shugert claims in Hunt's gulch, passed through Jackson to its destination, last Saturday. At the Wetzler quartz claim, near the Mammoth, a small vein of very rich ore was struck. It has the same characteristics as the rich quartz met with in the Mammoth, carrying arsenic and other base metals, as well as a liberal supply of gold. The strike furnishes another proof that the rich gold-bearing quartz seams are plentifully scattered over the mineral region around Middle Bar. John Wetzler and Martin White are developed the claim.

El Dorado.

WILL START UP.—*Mountain Democrat*, Jan. 17: Fred. Bendfeldt has got the water out of the gravel mine at Smith's Flat, and on Tuesday last, Wm. Rowlands made a survey preparatory to starting up the mine. This we believe to be a fine property, if properly opened up.

Inyo.

RICH ORE.—W. A. Greenly was over at Big Pine last Monday. He had samples of ore from a ledge recently discovered by him in Deep Spring district. The ore is very rich; pieces as large as a man's fist would when broken into fragments, hang together like a bunch of grapes. Native silver, in scales and veins, runs all through the ore. The ledge, so far as was yet seen, runs from a foot to 18 inches in width, but enough work has not yet been done to determine the extent of the ore body. The snow having been cleared from the trail the miners have returned to Beveridge, where work will soon be resumed. The Lasky mill will be put in operation some time during coming week.

Mariposa.

HORNITOS.—Cor. Mariposa *Herald*, Jan. 16: Last Saturday some boys were jumping near Mr. Adam's blacksmith shop and used for a weight a piece of quartz rock. One of the boys discovered that one end was heavier than the other, and upon examination found it covered with gold. He took it home, mashed it up and took out $12.75. Little Miling Campodonico also found a chispa yesterday while going to the spring for a bucket of water for the school. Messrs. Ham & Champion have several tons of ore crushed at Mr. Barcroft's mill last week. They expected to get at least $40 per ton, but I am informed by one of the parties that it paid but $6. The ore came from the Zamora mine. The Quartz mountain has also shut down on account of wet weather.

COULTERVILLE. — Mariposa *Gazette*, Jan. 17: Shreve and Goss have built a two-stamp mill on Black creek, about one mile below town. There are at present working on custom rock, and say it is paying. Water power is used as long as water lasts, then steam is used.

Plumas.

INDIAN VALLEY MINE.—Greenville *Bulletin*, Jan. 17: All legal complications affecting the title of the Indian Valley mine have come to an end. The title to this mine is now clear. It is considered one of the best mines in the county, and a great deal of money has been taken out of it. The developments in the Green Mountain mine prove conclusively that our mines improve as a greater depth is attained.

GREEN MOUNTAIN.—Above the Green Mountain mill where the ditch crosses the ravine, the ground is of such a nature as to slide more ore less, thus interfering with the supply of water to the mill. The superintendent has concluded it better to insure no further trouble on that score by building a flume across the ravine and of such length as to permit the slide to pass under the flume without interfering with it. The drill are now running in the face of No. 6 tunnel. The Sulphuret chute will be reached before the end of the month. An upraise has been made from No. 6 tunnel 130 ft back of the face. From this good pay ore is being taken continually. More men will be put into this chute as it is opened out. As soon as the Sulphuret chute is reached, an upraise will be made to connect No. 6 tunnel with No. 5 tunnel. This will be necessary for practical working purposes. The marked improvement in the mine is gratifying, and the indications are that at still greater depth, lies an immense quantity of good ore.

Shasta.

PLACER.—Shasta county *Democrat*, Jan. 17: Albert Houston is hard at word getting out 3,000 feet of pipe and a little giant from a gulch near Townsend's Flat and placing it on a rich piece of placer ground on a bench between Lower Springs and Salt creek. They expect to be piping the ground in about two weeks. Tom Green's mine near French gulch, with a little cannon-ball mill, is turning out $15,000 monthly dividends. During the late storm the shaft of the Silver King mine of Lowrey & Brincaid, s near Centerville, filled up with water and hoisting or ore has been discontined for the present. It is proposed to put in a steam pump to handle the water. At the bottom of the shaft the vein is widening and the ore is growing richer. This is one of the most remarkable finds ever made in Shasta county. The ores are chlorides and bromides of silver and resemble strongly the ores of Reese river. In fact, the great similarity of the rock to the Reese river ore induced Mr. Lowrey, the locator, an old Reese river miner, to locate and develop the mine.

Sierra.

BALD MOUNTAIN MINE.—Sierra *Tribune*, Jan. 17: The gravel lays in benches and is very rich, paying as high as $10 a carload. An incline 90 feet long, with a fall of about one foot in four, through which to work this deposit is nearly completed. It has a single track and the cars are handled with a windlass. The tunnel which the Co. is running in the South Fork ground is in hard rock.

BALD MOUNTAIN EXTENSION MINE.—The Bald Mountain Extension Company cleaned up 68 ounces of gold last Sunday as the result of one week's work in the South Fork ground. Only one breast is being worked at present. Over 200 feet of the incline from the turnout to the main tunnel are completed, leaving only about 40 feet to be run. By the time that is completed four new breasts will be opened out and a big increase in the output of bullion may then be reasonably expected. The channel is quite wide and gives splendid returns wherever prospected.

THE RAINBOW MINE.—Over $800 was taken out of the upper workings of the Rainbow mine, at Chipp's Flat, in a short time last week. The new tunnel has so drained that part of the mine that it requires but little pumping to keep it entirely clear of water. Work will be continued in that part of the mine. A ledge was encountered in the lower tunnel last Wednesday week but it has not been sufficiently developed yet to determine whether it is the main ledge or not. However, the appearance of gold in the rock is a very flattering indication that it is. The tunnel is not quite into where it was expected to reach the pay chute.

Trinity.

THE NORTH STAR.—Trinity *Journal*, Jan. 17: This is the title given a quartz discovery on East Fork, which is owned by P. A. Lefren & Co. The rock from the ledge, which is about two and a half ft in width, prospects well, and the owners are certain that they have struck it "big." Certainly, from a prospect seen of the rock, it does look as though they really have some pumpkins. Mr. James Brown, a practical miner, is now superintending the development of the mine.

THE BEST LOCALITY.—Yreka *Union*: Leonard Miller, of Oro Fino, who, for some time past has been building a quartz mill on New River, arrived here a few days ago. He gives a glowing account of the mine of that section. He says there are many quartz leads there that deserve to be classed with the very richest in the country. While he and another man were prospecting they found some float from a pound of which they extracted $25. He believes New River to be one of the best localities for prospecting in the country. Day, Moor & Hubbard, on East Fork, have been crushing rock for some time, and will make a clean-up about the middle of next month. They are confident that the result will excel the previous clean-ups. About three miles above Van Matre's ranch, on what is called Mule Creek, parties are at work on an abandoned quartz ledge and we are informed have found encouraging prospects.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Jan. 17: The main west drift on the 500 level has passed through the west wall of the vein where it has been stopped in order to allow the water to drain off from the old Mexican shaft and the saturated ground surrounding said shaft. The flow of water from this source is steadily decreasing.

HALE AND NORCROSS.—On the 2800 level west crosscut No. 2 has been in a solid body of quartz for the last 25 feet. This quartz is of the same kind as was passed through in west crosscut No. 1 before the ore steak was reached. Crosscut No. 2 is liable to cut into ore at almost any time. Work will probably not be commenced on the 2900 level until the drift on the 3000 level from the Combination shaft has conhected with the bottom of the main Norcross winze.

COMBINATION SHAFT.—The new hydraulic pump on the 3000 level is now running very smoothly, and will soon be so far regulated that it may be put up to its full speed. Some slight alterations are occasionally made, and parts tightened up as the bearings become smooth from friction. The pistons or plungers have been unpacked and made to fit more closely than when the pump was started. No pump of the kind in any place in the world is working at such a great depth below the surface of the earth—2000 ft.

CON. CALIFORNIA AND VIRGINIA.—On the 1550 level are repairing the main drift. Stope No. 6, on the 1750, has been repaired and put in order for the extraction of ore. They are now hauling the old workings, in which some ore that will pay for working is being found and extracted.

BEST AND BELCHER.—The west crosscut on the 825 level, at the Gould and Curry north line, is still in vein material of a very promising appearance Streaks of the quartz are occasionally met with that give low assays. There is on this level a large area of unexplored ground, parts of which contain streaks of quartz of considerable magnitude.

SAVAGE.—The E-street tunnel is now passing through the old stopes, but has not yet reached the point where it is expected that ore will be found.

CROWN POINT.—The old upper levels continue to yield a considerable amount of low-grade ore, which is being sent to the mills on the Carson river for reduction. Much ore has been opened up ready for extraction.

ALPHA.—A winze is now being sunk on the 900 level to prospect the large body of quartz, which has heretofore been explored from the 600 to the 900 level, below the latter point.

YELLOW JACKET.—The usual amount of low-grade ore is being extracted and sent to the mills on the Carson river. A considerable amount of prospecting is being done.

MEXICAN.—The main south drift on the 2700 level was last week cleaned out and repaired.

BELCHER.—A considerable amount of low-grade ore is still being extracted and shipped to the mills.

SIERRA NEVADA.—Are cleaning out and repairing the main drift on the 2300 level preparatory to making explorations at that point.

Bernice District.

GOOD RETURNS.—*Silver State*, Jan. 16: W. Williams arrived in town yesterday from Bernice, bringing with him nine splendid bars of silver bullion, which was valued at $10,500, and were shipped to San Francisco. This bullion was the result of 27 days' work of the Golden Crown Mining Company's mill. The company make regular monthly shipments of bullion. Mr. Williams informs us that his company employs at the present time 50 men; and he has room for the employment of six more persons in cutting wood for the mill. The mill is one that they have at the present time on lease; is of five stamps, and the ore which is now being worked goes from $60 to $100 per ton. In the spring they will put up a new ten-stamp mill, and will have a great plenty of ore to keep it running steadily. Their mine at the present time is looking far better than it has ever heretofore. Last week they made a new and important strike, and reached ore in a large quantity, the vein being four feet in width, and paying $100 per ton. Their bullion goes over .900 fine, and he says they have shipped bullion that ran up to .985 fine. The bullion contains but a small per cent of gold, however. He informs us that he worked 25 tons of ore from the Wild Goose mine in that district that produced $100 per ton, and that Mr. Healey has plenty of ore that will pay $125 per ton, but it is impossible to get it worked, as the mill cannot reduce the ore that is extracted from the Golden Crown mine. He says there are also many other mining properties there that contain immense bodies of ore, and that it will be but a short time when great activity will prevail all through that section of country.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Jan. 16: The north crosscut on the sixth level is in 121 ft and the west drift on the same level is in 60 ft. The crosscut near the face of the west drift on the fifth level shows a 3-ft ledge which is much mixed with waste, but contains considerable $50 ore. The raise from this drift is up 30 ft, and shows a little ore of fair grade. In the intermediate, between the third and fourth levels, west of the shaft, some $90 ore is being taken from a small bunch. In the intermediate, between the second and third levels and east of the shaft, there is a small stope of $50 ore that looks promising. The stope west of the shaft, between these levels, is looking well. The intermediates, between the first and second levels, are giving some ore of fair grade, and some ore of fair grade is being taken from the first level.

Comet District.

SUPPLIES.—Pioche *Record*, Jan. 10: The prospectors out at Comet District are all putting in a big supply of grub. All ont there have about six months rations on hand. James Burrows brought in a load of $500 rock Thursday, and left with a wagon load of grub for himself.

Osceola District.

DITCHING AND FLUMING.—White Pine *Reflex*, Jan. 10: James Benson who returned from the neighborhood of Osceola, says ditching and fluming is going right along and that the calculation is to have all in readiness to catch the June thaw.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Jan. 16: Upraise on east vein, 150-foot level, has been carried up 65 feet. Progress five feet, ledge small, ore low-grade.

INDEPENDENCE.—In the workings above the 175-foot level, the ore seams are very small, and but little ore is being extracted.

GRAND PRIZE.—No change of importance. Mill is now running all right and working up the ore on hand.

NAVAJO.—The stopes on the different levels are looking fair. The usual grade and quality of ore has been milled the past week.

Wild Rose District.

PARADISE.—Virginia *Enterprise*, Jan. 16: J. V. McCurdy arrived on the Comstock yesterday. He says he is going right ahead with the construction of a new mill at Paradise to take the place of that destroyed by fire. They began shipping lumber and timbers from Boca yesterday. Not much can be done in the mine until the new mill is completed, as there is no place for the ore. There are already over 700 tons of ore piled up at the site of the mill, where it is in the way. The mill that was burned was, of the kind, as perfect as a mill can be made. It cost $75,000, though it contained but ten stamps. The new mill will differ from the old one in that it will contain concentrating machinery. Mr. McCurdy says they will be able to resume paying dividends soon after the new mill starts up.

COLORADO.

ITEMS OF INTEREST.—Colorado *Mining Gazette*, Jan. 16: John Needham's "flat vein" is turning out some fine ore. The Tropic, on Seaton mountain, is yielding well for the lessees. The Little Beula lode is turning out some elegant stamp mill dirt. The most extensive developments on Soda creek will be found on the Gold Leaf lode. Nearly all the mines on Seaton mountain which are being worked are producing profitably. Captain Hall's Queen mine, Seaton mountain, is looking splendid. Ore is being shipped steadily. The deepest shaft in the Soda creek gold region is on the Golden Leaf lode and is 190 feet deep. Six cars of ore from the Joe Reynolds mine arrived at the Idabo Springs Public Sampling works this week. Mr. Dan Doyle is working the Ute load in Bullion camp. This property is one of the best in this now celebrated camp. Five sets of lessees are now working on the Grand View mine, Seaton mountain, with good success.

ARIZONA.

A PROSPECTIVE CITY.—Cor. Tombstone *Record*: At Clark City, the mining camp in the Swishelm mountains, buildings are going up as fast as the lumber comes in. Wood and water are plentiful, also labor. The Great American mine employs about 50 men. Considerable prospecting is being done.

MONTANA.

BLUE BIRD.—Butte *Miner*, Jan. 14: There seems to be no let up to the ore extraction, but rather a steady increase. New developments in and about Butte are daily going on and with the most gratifying results. The Blue Bird property, recently purchased by a California company, is being put in shape for heavy work. Superintendent Fleming has erected a new ore-house and is putting in hoisting machinery, erecting a gallows frame and putting up a large whim. At 50 ft a large body of 35-ounce ore was struck. Ore is being taken out of the tunnel at a cost of $1.50 per ton. The vein is six ft wide and stoping is being prosecuted with vigor. The assay valuation is 50 ounces silver. The Mono has been developed on the surface by an 80-ft shaft. The average width of vein is 2½ ft, carrying 70 per cent manganese and 20 ounces silver. There is a continuous body of this ore so far as the east level has been run, 300 ft. One hundred and fifty ft of the level has been stoped out on the surface having plenty of ore on the face.

THE GAGNON.—Stoping continues above the 600 level, in the 500, 400 and 300. About 30 tons are taken out daily and sent to the Colorado smelter and the concentrator. The management continue to observe the most rigorous policy in assorting, separating the poor and rich ores which go from 30 ounces to 15 ounces in silver. About 25 men are employed. The Black Bear, north of the Alice, and now under lease to the Devlin Brothers, has a shaft down 100 ft. They are taking out 60-ounce ore from the east level and having it milled at the Moulton. The Katie Morris, just west of the Mountain Boy lode, is under lease to McMillan & Co. The shaft is down 130 ft. A 60-ft level has been run west from the 100-ft station. The level was driven in on the vein and 60 ounces and upwards of free-milling silver rock is being taken out. Over 100 tons of this rich material is now on the dump. The Margaret Ann lode, situated north of the Alice mine, is owned by the Montana and Baltimore M. & M. Co. The Margaret Ann is one of the best properties north of Walkerville. The pay streak is 3½ ft wide, and averages 47 ounces free-milling ore and $6 in gold. The new mill of 15 stamps is completed and ready for work.

STAR OF THE WEST.—Butte *Miner*, Jan. 14: A visit to Meaderville yesterday resulted in the discovery that the damage done recently by the cave in the east level in the Colusa was of more importance than at first supposed. Stoping had been done for a great distance from the shaft east, on the 160-ft level. This work was prosecuted so faithfully and well that the surface was very nearly reached when the top ground went down, taking with it a portion of the tramway. Water from the surface began pouring in, and materially changed the aspect of affairs. This body of water took its natural course, finding its own level finally in the sump. Two compound pumps were on the ground and immediately put in working order. Their capacity is 900 gallons per minute, and both are kept busy hoisting water from the sump in the main shaft, which is 600 ft in depth. Developing is going on in the 500 and 600-ft levels. Timbering is going on and all kinds of work necessary to put the mine in excellent order. The West Colusa and Company Parrot have a force of men at work in the lower levels and are driving both ways. The Star of the West is under lease to Samuel Hoar, who is sinking on the main incline, which is now down 240 ft. The ore body is from 20 to 36 inches in width and very rich. Stoping is being done in the 100-ft level and the ore extracted sent to the Colorado smelter.

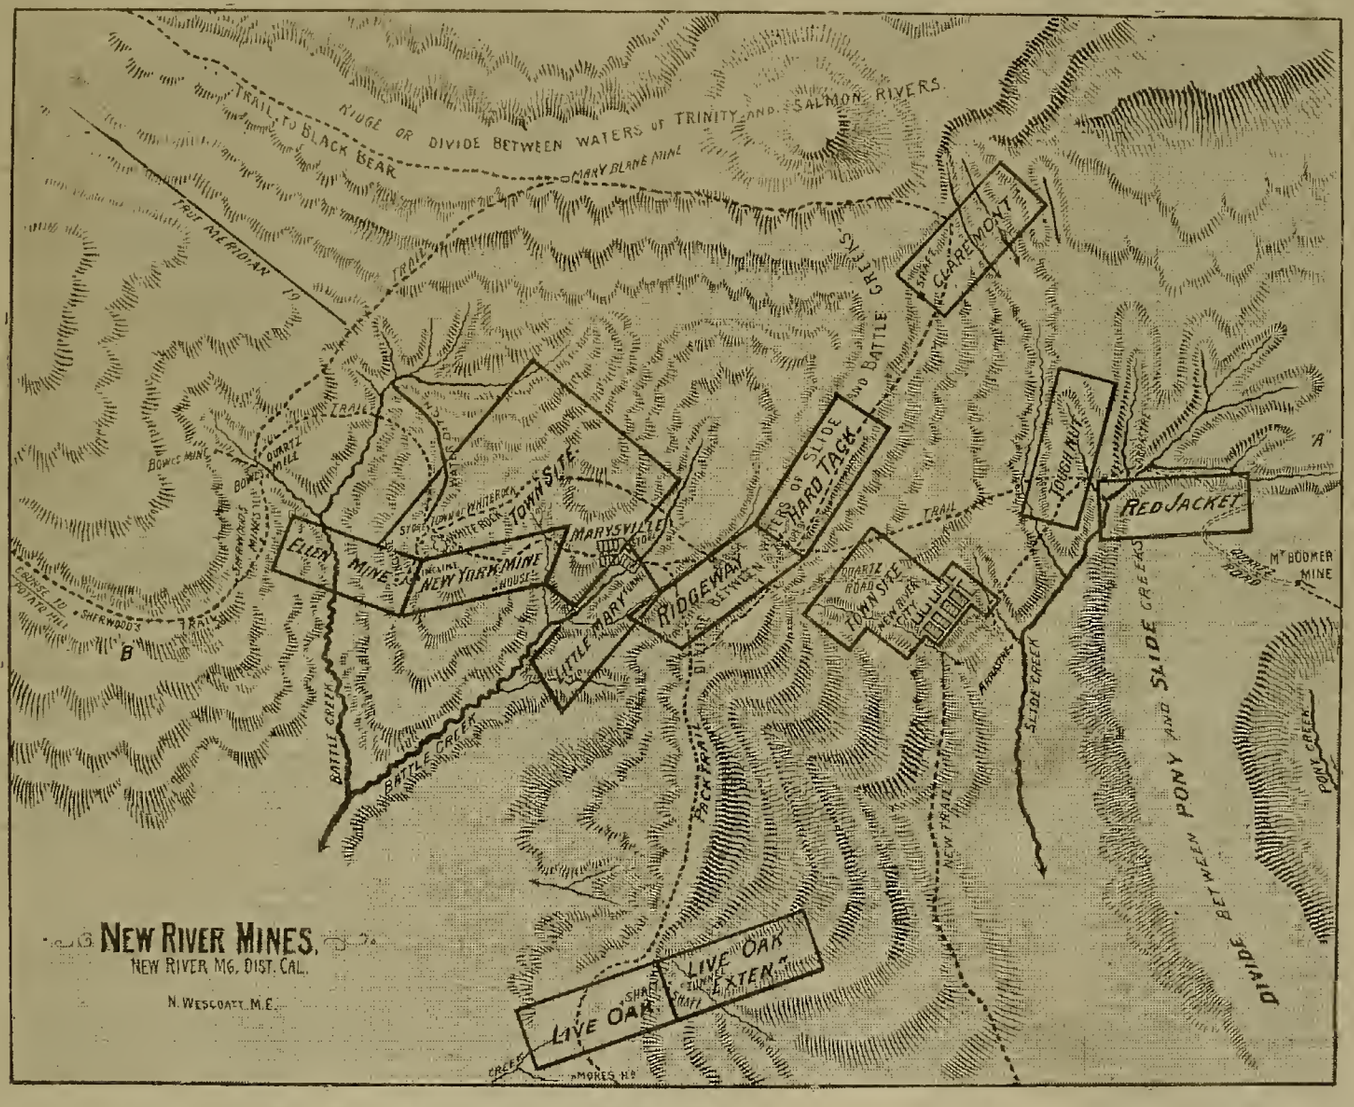
UTAH.

FINANCIALLY DISTRESSED.—Pioche *Record*, Jan. 10: The Mountain Chief Mining Company, near St. George, Utah, where about 30 coal burners went from here, we learn from a couple of men just from there, is bankrupt. Their checks have been protested and the company bas closed down. The ore in the mine goes high in lead, but carries very little silver. The low price of lead is said to be the cause of it, but, from what we learn, we believe the trouble is owing to the lack of funds.

REVIEW.—Salt Lake *Tribune*, Jan. 10: The shipments from this city for the week ending Saturday, January 10th, were 24 cars of bullion; no ore. The new and higher rates of freightage did the business, as designed, and no (or but slight) shipments can be expected of ore away from Utah till there is a change. There is no relief, either in the embargo of Wood River ore; no Queen of the Hills ore has been received during the week, and but little from that region. The receipts of ore and bullion in this city for the week ending January 14th, was $103,999.45, of which $79,859.45 was bullion and $24,140 ore. The week previous the receipts were $106,747.10, of which $34,291.10 was bullion. The shipments of the Ontario for the week were 50 bars, of the value of $33,884.45; total for the present year, $65,982.99. The product of the Hanauer smelter for the week was nine cars of bullion, valued at $23,800. The Germania smelter produced during the week ten cars of bullion, $22,176. The ore receipts here for the week were valued at $24,140, of which the Crescent shipped three lots, valued at, $8,300. The rest of it came from Idaho, of which the Minnie Moore, Wood River, sent $13,190 worth, and $2,650 worth came in two cars, classed as "Idaho ores."

The New River Mines.

The attention of the mining community of California is just now being turned to the new gold mining region in Trinity county, known as the New River District. The mines were discovered last summer, but no development work of any description has been done upon them. Enough has been shown, however, to warrant the belief that a district of some value has been found, and no doubt a great many men will go there in the spring. There is quite an extent of country to be prospected. The ledges run at right-angles with the vein, and it is thought that for some 60 miles more or less mines will be found. The accompanying map shows the central portion of the district, and was made by Mr. F. Weasco t, U. S. Deputy Mineral Surveyor. Mr. James H. Crossman, the well-known mining man, furnishes the *Post* with a description of the region, from which we condense the following:



The New River mining district is situated on the headwaters of the tributaries of New River, a branch of the Trinity. It takes its rise in the Salmon range of mountains, the dividing ridge between the waters of the Trinity and the Klamath rivers, and at a point where Humboldt, Siskiyou and Trinity counties meet. New River city, of New River district, is forty-five miles as the crow flies from Eureka, at Humboldt bay. The topographical features of the northern portion of Trinity county, in which we find this new district, are strongly marked, and show evidence of, at no remote period, violent volcanic activity, upheaved regardless of order or system, tossed and tumbled into every conceivable form.

The main mineral belt in which the mines of New River district occur, varies from three to four miles in width and on its line of strike in a northwesterly and southeasterly direction is traceable for a distance of more than 60 miles. The newly-discovered mineral district, the Enterprise, situated 30 miles southeasterly from New River district, on the east fork of the Trinity, where W. T. Coleman, of this city, has recently made purchases of mines, is on the same formation; thence following the belt we reach the rich mines and placers contiguous to Weaverville and Shasta. This belt is composed of slates (serpentine and allied metamorphic rocks) with intrusive dykes of dinrite (greenstone trap), syenite and porphyry. The veins are, as a rule, small, varying from a few inches to several feet, the gangue, ferruginous quartz, carrying free gold—the line of decomposition probably extending to a considerable depth. The altitude being about 4,000 feet, the snows of the winter soon melt and run off. The side-hill is densely covered with timber—fir, pine and oak. The branches of the streams all carry running water—crystal springs of icy coldness are often seen. Water for motive power is obtainable in the creeks in near proximity to the mines.

Placers.

The beds of Slide and Eagle creeks immediately below the newly discovered mines, are virgin for a distance of six or seven miles—a good field for the placer miner, as the north fork of New River, below the junction of these two streams, has been extensively worked with results of one ounce per day to the man, with an occasional big nugget and rich strike. It is reasonable to infer that the intermediate ground immediately below the rich veins recently discovered, should be correspondingly rich in placer gold. The depth of the soil, together with the dense growth of heavy timber, has heretofore deterred the prospector from testing these grounds.

New River mining district, contains three rival town sites, each aspiring to be the metropolis of the district—the first, New River City, being in the vicinity of the leading mines, and situated, as it were, at the gate of this new El Dorado, where the wornout traveler will be quite willing to rest and stable his tired steed. It is already building up as rapidly as lumber can be procured. The next town, three-quarters of a mile distant, is known as "Marysville." Thence, northerly, one-half a mile, we reach "White Rock City."

History.

It is but recently that vein mining has been prosecuted in this locality. The district was discovered and brought into notice by Mr. Stephen Sherwood, a '49er frontiersman, and inveterate prospector, who, like the Wandering Jew, drifted from place to place in search of new discoveries, fresher fields and fairer flowers. He discovered Meadow Valley, Pioche, and many other valuable districts. While in the vicinity of Shasta, this mineral belt attracted his attention. He followed it, until he camped in what is now known as the New River district, exclaiming, "Eureka." He made some locations, communicated his find to his friends, prospectors came in, and with them Messrs. Clement, Clifford and Ladd. They discovered or purchased the Mountain Boomer, built an arastra, and in a short time ground out $11,000, with a profit over all expenses of $8,000. The inhabitants of the lumber region of Humboldt county heard of the strike. They exchanged their saws and axes for picks and shovels, and came in by hundreds. They took the place by storm, formed a district and commenced prospecting. They soon discovered veins of quartz, made locations, of which quite a number have developed into valuable mines. The map accompanying this article contains, of the hundreds of locations, only such as have been surveyed, giving but a faint idea of the actual number. Many of the unsurveyed locations have great apparent values, and new mines are daily being discovered.

Some of the Mines.

The following is a description in brief, of such mines as Mr. Crossman examined, while in the district:

The Mountain Boomer—Evidently a slide—rock not in place; ore pays in arastra, $120 per ton; difficult to separate from the debris; incline 20 feet and shaft 12 feet.

Hard Tack—Situated 200 feet above the trail, strike a few points north of east; vein 15 inches; average assay of ore $194.16 per ton; shaft 62 feet deep; drifts at bottom 30 feet; now stoping quartz said to average in arastra $200 per ton; select samples paid 20 cents per pound.

Ridgeway—Tunnel 100 feet in vein (an adit); vein 20 inches; this mine is a westerly extension of the Hard Tack, and prospects the same; since examination a winze has been sunk; at end of adit vein much larger, and are fabulously rich; there are several other locations on this vein that prospect well.

Tough Nut—2,200 feet south and parallel with Hard Tack; ledge 16 inches; ore will average $100 per ton; adit level following vein 50 ft. Gutson Mine—Below Hard Tack; adit level 50 feet; 2-foot ledge; $50 rock.

Nevada—Situated on Slide creek, below trail; vein 15 inches; assays average $105.50; shaft 4 feet.

Yankee Boy—Strike east and west; vein from 3 inches to 20; average value $40 per ton; crosscut to ledge 200 feet; shaft 7 feet; 5-stamp mill, 250 pounds each; power, water.

Anchor—Situated on Battle creek; 2,000 feet below Yankee Boy; 15-inch ledge; $115 rock; shaft four feet.

Armstrong, No. 2—On Battle creek; 1,000 feet below Yankee Boy; 4-foot vein; course northwest and southeast; crops boldly, and assays $75 per ton.

Hunter—Below "White Rock;" vein sixteen inches; course east and west; dip forty-five degrees north; developed by several open cuts, 200 feet apart; can work by adit on vein; ore by assay gives an average of $56; select $300 per ton.

Hachunuc—Extension, and same as Hunter Extension—Same; these three mines can be all worked from one adit with 1,000 feet backs.

Sherwood—Small vein; well prospected by incline 130 deep and drift 20 feet, with several other openings and cut; assays $36 average.

Live Oak—An extension; situated below Marysville; 2-foot ledge; average assays $75; course northwest and southwest; 50 foot adit level on vein.

Mary Blaine—Situated on a bald peak; altitude 5,000 feet, commanding view of Shasta peak and other points of note; strong vein in talcose slate, carrying quartz; strata rich; incline shaft 30 feet; 5 stamp mill, 250 pounds each, and a sawmill; power, steam.

Armstrong No. 1—Three locations, below Mary Blaine; but little work; course northwest and southwest; ledge 15 inches to 24; shows free gold in rock.

Potato Hill—A number of locations; recent discoveries; veins said to be six feet thick, showing gold freely.

Pony Creek—Report says that the ledges are from two to three feet thick.

Mining Assessments in 1884.

During the year 1884 some 210 assessments have become delinquent on 120 mines in California, Nevada, Utah, Alaska, Arizona, Lower California and Mexico, all of which are incorporated under the laws of California. The aggregate amount of these 210 assessments is $4,724,700. During the year 1883 the number of assessments becoming delinquent was 235 on 148 mines, aggregating $5,885,800. This is the amount levied. The actual sum collected is another thing. Of the amount levied in 1883, the Noonday, North Noonday and Red Cloud mines each levied $100,000, making $300,000, not a dollar of which was paid. There were probably many other cases where only a portion of the amount levied was collected. It is impracticable to get at the actual amount collected in any one year. The best that can be done is to give approximate figures. In former years, when people promptly paid their assessments, the returns were more reliable, as the collections corresponded more closely with the levies. Probably more assessments have gone by default this year, in proportion to the amount levied, than in any previous year.

The *Bulletin* sums up the assessment situation as follows: Four assessments have become delinquent on the California mine this year and one on the Consolidated Virginia mine. Each of these was at the rate of 20 cents per share, and each of the assessments, had all the shares been assessed, would have made $108,000, or $540,000 in all. But, on inquiry at the offices of these companies, we find, that owing to the large amount of stock forfeited, the Consolidated Virginia assessment amounted to only $93,000 and the California assessments to $34,000 apiece, so that instead of $540,000 from the above five assessments, the amount collected was only $259,000. The corrected figures appear in our list. This is probably the worst case on the Comstock. Most of the other Comstock mines collected nearly all the amount levied. Last October the California and Consolidated Virginia mines were consolidated under the name of the Consolidated California and Virginia Mining Company with a capital of $21,600,000 in 216,000 shares, in place of $103,000,000 in 1,080,000 shares. The new corporation levied its first assessment of 30c per share on the 5th of November. This assessment became delinquent in the office on the 10th of December. All the old stock has not been transferred to the new organization, but a considerable part of the assessment has been paid.

The Northern Belle presents even a sadder case than the one just considered. This mine is in Esmeralda county, Nevada. It was a good mine from the start—that is, it was opened and placed on a dividend-paying basis without cost to stockholders. It kept up its disbursements to stockholders for several years. The last dividend was paid in March, 1883. This was the seventieth dividend, and made a total of $2,530,000. Indications of trouble were even then apparent. The Holmes Mining Company commenced a suit against the Northern Belle and obtained a judgment of $400,000. On the 3d of November, 1883, the Northern Belle levied its first assessment of 50c per share, or $25,000. Very little of the assessment was paid. On the third of January, 1884, a second assessment of $8 per share was levied, aggregating $400,000, the largest mining assessment ever levied. This was to satisfy the judgment of the Court in favor of the Holmes Company. Subsequently the Holmes Company took 700 shares of the stock, together with the Northern Belle mine and all the property connected therewith, releasing at the same time the directors and all the stockholders from all liability for the judgment of $400,000 awarded by the Court. Neither of these assessments will be found in our list, though both became delinquent. It is possible there may be some other assessments that ought to be ruled out for similar reasons, though the aggregate amount thus involved would hardly make as large a sum as that we have already eliminated. It is probable that nearly $4,000,000 of $4,724,700 listed herewith has been collected. The names of the mines on which assessments have become delinquent in 1884 are as follows:

Acme Mill	$8,000	Jupiter D. Gravel	10,000
Alaska	35,000	Justice	26,250
Alaska Mill	3,400	Lady Wash. Con	10,800
Alpha Consolidated	45,000	La Grange Hyd	5,000
Alpha Hydraulic	7,500	Lake Co. Quicksilver	6,250
Andes	27,500	Lewis Consolidated	3,000
Alta Consolidated	162,000	Loretto Mill	20,000
Argenta	10,000	Mammoth Bar	45,000
Antiman Mill	2,000	Marshall	3,000
Baker Divide	2,000	Martin White	34,500
Belmont	25,000	Massachusetts Cor	1,000
Belle Isle	35,000	May flower Gravel	32,500
Benton	48,600	Mexican	226,000
Best & Belcher	216,000	McElroy Gravel	3,000
Blue Bluff Gravel	2,000	Milton W. & Gravel	75,000
Bodie Consolidated	50,000	Morrell Con	1,000
Bodie Tunnel	20,000	Mono	25,000
Bullion	25,000	Mono Lake Hyd	10,000
Butte Creek	2,000	Morgan	16,000
Caborca	15,000	Murchie	15,000
California	136,000	New Coso	4,000
Champion (Mono Co.)	15,000	New York Hill	30,000
Champion (New Co.)	11,100	North Belle Isle	10,000
Christy	00,000	N. Gould & Curry	37,500
Chollar	108,000	North Peer	2,000
Columbus Con	25,000	Oleta	1,000
Con. Amador	15,000	Ophir	201,000
Con. Imperial	50,000	Overman	28,800
Con. Virginia	93,000	Pedro Consolidated	5,000
Con. Cal. & Vir	64,800	Peer	20,000
Copperopolis	5,000	Peerless	50,000
Crocker	25,000	Pinal Consolidated	10,000
Cueva Santa	30,000	Pittsburg	25,000
Day	105,000	Pleasant Valley	10,000
Dayton	40,000	Potosi	140,000
Delaware	5,000	Rainbow	45,000
Diana	10,000	Red Hill Hydraulic	5,000
Eastern Quicksilver	5,000	Real de la Castillio	2,000
Eintracht Gravel	15,000	Santa Ana	3,000
El Capitan	3,000	S. Miguel & La Trin.	50,000
El Dorado Con	15,000	Savage	224,000
El Dorado S. Con	50,000	Segregated Belcher	9,400
Elko Consolidated	30,000	Sierra Nevada	250,000
Enterprise Mill	3,000	Silver Hill	5,400
Equitable Tunnel	8,000	Scorpion	20,000
Eureka Con	50,000	Solid Silver	5,000
Exchequer	20,000	Standard Con	25,500
Excelsior Gravel	100,000	Starlight	6,000
Golden C. Drift	3,000	Sterling	1,000
Golden Fleece G	21,500	Summers Con	2,500
Goodshaw	10,000	Summit	2,500
Gould & Curry	162,000	Telfair	2,500
Grand Prize	80,000	Tilden	5,000
Hale & Norcross	190,000	Tohongo	3,000
Head Center Con	10,000	Union Consolidated	250,000
Holmes	100,000	Union Gravel	5,000
Humboldt Hill	3,000	Utah	70,000
Independence	40,000	Villagrana	2,000
Indian Springs D	14,000	Wall St. Quicksilver	9,000
Julia Consolidated	11,000	Wildman	2,500

It will be noticed that the number of assessments varies from 1 to 6, and the amount of the levies from $1,000 to $250,000. The Sierra Nevada and Union Consolidated have each levied $250,000 this year. The levies may be apportioned as follows:

CALIFORNIA.

Counties.	Amount.	Counties.	Amount.
Amador	$22,500	Los Angeles	$3,000
Butte	24,000	Mono	160,000
Calaveras	32,000	Nevada	172,000
El Dorado	22,000	Placer	103,600
Fresno	1,000	Sierra	95,000
Inyo	4,000	Stanislaus	5,000
Lake	20,250	Yuba	100,000
Total			$764,350

NEVADA.

Counties.	Amount.	Counties.	Amount.
Elko	$215,000	Lyon	$10,000
Esmeralda	130,000	Nye	105,000
Eureka	68,000	Storey	2,932,450
Humboldt	3,000	White	34,500
Lincoln	165,000		
Total			$3,632,950

ARIZONA.

Counties.	Amount.	Counties.	Amount.
Cochise	$20,000	Pima	$102,000
Cila	2,000	Pinal	13,000
Total			$137,000

UTAH.

Salt Lake county	$8,000
Washington	60,000
Total	$68,000

ALASKA.

Douglas Island	$3,400

LOWER CALIFORNIA.

Real de la Castillio	$2,000
Villagrana	2,000
Total	$4,000

MEXICO.

Chihuahua	$50,000
Sinaloa	45,000
Sonora	20,000
Total	$115,000

These amounts compare as follows with those delinquent in the previous year:

	1883.	1884.
California	$1,196,044	$764,350
Nevada	4,244,490	3,632,950
Arizona	165,500	137,000
Utah	52,000	68,000
Dakota	10,000	.....
Alaska	20,250	3,400
Lower California	4,500	4,000
Mexico	193,000	115,000
Total	$5,885,784	$4,724,700

Deducting $300,000 levied by three Mono county mines in 1883, but not collected, and there is but little difference in the tables for the two years for California. Nevada has levied $800,000 less than in 1883. Storey county has called for much more money this year than the bullion produced in that county has sold for. As there have been no dividends from that county, except the small amount paid by the Kentuck, it has required the value of the bullion and all the assessments collected to keep the mines there open and allow the work of searching for ore to proceed.

Gold and Silver in San Francisco.

Assistant United States Treasurer Spaulding, of this city, reports the following money in the Government vaults under his control at the close of business on the last day of December, 1884:

Gold coin	$56,002,600
Standard dollars	19,336,000
Fractional silver coin	7,887,655
Paper money	5,080,000
Nickels	16,000
Total	$88,321,655

This amount is about $100,000 in excess of the total at the close of November, and is the largest amount ever reported at this institution at the close of any month. There was a gain of $1,370,000 in gold coin in the month of December, most of which was for New York account, and was represented by silver certificates forwarded instead of coin. There was also a small increase in other metallic money, but a decrease of $1,630,000 in paper money, mostly silver certificates.

The cash balance in the Sub-Treasury at the commencement of business on the first day of each month this year compares as follows:

January 1st	$72,197,188
February 1st	72,420,567
March 1st	75,650,556
April 1st	81,841,109
May 1st	82,230,000
June 1st	82,727,417
July 1st	82,872,311
August 1st	83,124,553
September 1st	82,552,906
October 1st	82,092,798
November 1st	88,102,790
December 1st	88,220,384
December 31st	88,321,655

There has been a gain during the year of $16,124,467, as follows:

Gain in gold coin	$16,539,000
Gain in silver coin	2,767,467
Total gain	$19,506,467
Decline in paper money and nickels	3,382,000
Net gain in 1884	$16,124,467

The United States Mint in this city coined $20,447,500 in gold in 1884. Most of this, as will be seen above, found lodgment with the Assistant United States Treasurer of this city, and very largely in exchange for coin certificates, which certificates were forwarded to New York in lieu of sending gold. By this means the bankers and merchants economized something in the way of exchange. The disposition of the gold coin made at the local Mint last year may be disposed of as follows:

Coined in 1884		$20,447,500
Paid in at Sub-Treasury	$19,539,000	
Sent out in mails	1,330,800	
Sent out regular way	1,310,200	
		19,230,000
Added to local circulation		$1,217,500

Economical Ore Reduction.

On Friday of last week there were about 2,000 tons of ore in cars at the works of the Omaha and Grant Smelting Company, in this city. Fully as much more is in stock. This ore is drawn from all the various camps in the State, as well as outside localities, and hence embraces all grades and varieties rich enough to bear the cost of transportation and smelting treatment. Gold, silver, lead and copper ores are represented in both desirable and refractory combinations. The Grant works, and in fact all the large works of the valley towns, are fully abreast with all the latest improvements and methods for economical ore reduction, and are the competitors of all process workers, with the difference that they buy and reduce in bulk instead of test lots. These large smelting plants do not employ similar devices, but they save values as closely and economically, while doing a much larger business than all the process men combined. The skillful combination of the various ores permits the free smelting of a large per cent of refractory ores without a preliminary roasting. One bed was pointed out which contained 65 tons of Mary Murphy ore, which was so distributed and combined with desirable ores that the product will smelt as readily as a straight Leadville or Battle Mountain carbonate of lead product. This Murphy ore is not objectionable to these large establishments, because they have the facilities as well as the skill for mixing and smelting, without being obliged always to give it preliminary roasting. Fine concentrates and powdered mill tailings are roasted for 24 hours, and then raked into an adjoining furnace and melted into slag, which, after cooling and being broken up, is in fine shape for the water-jacket furnace. This treatment requires about 27 hours, is cheaply performed, and, while preventing the loss that would occur if fed in original form into a blast furnace, is converted into a most desirable product, whose every value is retained. Is is questionable whether the owners of the Mary Murphy mine will build works of their own near that property, as has been currently reported, because a trial has shown that the ore can be sold to fully as great advantage to owners as their own private works could achieve. Such a decision on the part of the Mary Murphy Company, after two years of experimenting with special processes, would be a strong testimonial to the efficiency and progress of the established and legitimate smelting works as compared with special processes. Another feature distinguishes such works as the Omaha and Grant smelters—their furnaces are operated day and night, for months at a time, without cessation, and one furnace was not entirely cooled for a period of 18 months. This record is in marked contrast to the weekly or monthly "blow outs" of small works everywhere.

Of course, good and sufficient reasons may be shown for the interrupted campaigns of small and new works, but a mine having a large output desires to patronize works where "these good and sufficient reasons" for irregular operation do not occur. The immense output of the State necessitates steady and continuous work by smelting furnaces to give stability to market values, and it should be remembered to the credit of our Leadville, Pueblo, Denver and Golden smelters that they have not retarded mining operations by either insufficient capacity or lack of funds to pay cash for ores.

These establishments have steadily enlarged their capacities to meet the requirements of increased ore production, have supplied the necessary capital and have met all competition in a fair field without resort to efforts to crush out a single weak competitive process. The smelters have neither cut down wages nor advanced prices of treatment to a point which has caused any reasonable and well-posted miner to complain. Though silver and lead have declined to a degree never before experienced, the smelters have borne the brunt of the decline, and have sought relief in greater metallurgical skill and the closing of every avenue for the escape of values in the ore while it is undergoing treatment.

Notwithstanding the fact that silver and lead have greatly fallen in price, and many mines are idle in consequence, there is less of harsh criticism and a better feeling between miners and smelters than was ever the case in our mining history. The sagacity of our smelters has equaled their skill, for notwithstanding the immense values locked up in bullion and held for months upon a falling market, they have managed their deliveries so as not to bear the market and yet to realize without bankruptcy to themselves. This is no inconsiderable feature to observe in the conduct of a business of such magnitude, and when viewed in a comprehensive light, including all details, reflects the highest credit upon the skill and sagacity of all those gentlemen engaged in the enterprises of ore reduction on a large scale in the State of Colorado.—*Denver Tribune-Republican.*

UTAH'S MINERAL PRODUCT, 1884.

Wells, Fargo & Co's Statement of the Mineral Product of Utah for 1884.

BASE BULLION.	LBS. LEAD, REFINED.	LBS. LEAD, UNREFINED.	OZS. FINE SILVER.	OZS. FINE GOLD.
Germania Lead Works	4,840,987	1,513,455	60,264	202
Hanauer		12,390,865	651,099	2,138

Nevada at the Exposition.

The New Orleans *Times-Democrat* has the following to say in regard to the Nevada exhibit at the big Exposition: The exhibit from this State is now well under way and already presents features of surprising interest. It was to be expected that a State containing the great Comstock lode, a State which can boast of the Sutro tunnel, a State, the mineral resources of which have enabled Mackay, Flood and O'Brien and the other "bonanza kings" to amass their enormous fortunes—it was to be expected that such a State should send an unequalled collection of minerals and ores. But it is with some surprise that one sees in the midst of the exhibit from Nevada specimens of the cotton plant bearing cotton equal to that of the sea-island plantations, potatoes weighing more than four pounds, apples rivaling the finest shown in the collection of any fruit-growing State. It is there that the impartial observer may be excused if his enthusiasm becomes unbounded. However, notwithstanding the excellence of the agricultural display, the main feature of the exhibit is the collection of minerals and photographs relating to the great mining industries of the State. The State Commissioner is Colonel C. C. Thomas, the superintendent of the far-famed Sutro tunnel, and it is to his energy, unaided by any State appropriations, that Nevada owes this magnificent exposition of her resources. The collection is made of specimens from a large number of Nevada mines and several line collections from private cabinets, notably those of Senator Jones, J. Shaw, S. Dowling, the State cabinet, the cabinet of the Pacific Coast Pioneers, an organization made up of 49ers, and W. M. Havenor, who will remain here in charge of the display. The collection is a large one, well classified and labeled.

Specimens of ore are shown which assay at $20,000 to the ton. Large photographs on the wall present vividly some of the picturesque localities of Nevada and views of the more prominent mines. The original drawings of the great Sutro tunnel are also displayed. This marvelous feat of engineering consists of a tunnel eight miles in length, driven into the side of a mountain at a depth of 1,600 to 1,700 feet. The diameter varies from eight to sixteen feet. This tunnel was driven for the purpose of draining the numerous mines clustering around the great Comstock lode. The yield of these mines and the fortunes amassed by their owners are almost beyond computation. But for this tunnel they would to day be useless. The tunnel itself is no mean source of income to the members of the corporation maintaining it. The method of payment adopted is to collect from each mine drained $1 for each ton of ore taken out and yielding less than $30, and $2 in case the yield is more than $30.

The Salt Lake Ore Market.

S. W. Eccles, General Traffic Manager of the D. & R. G. Western, has returned to Utah from his Eastern trip. Mr. Eccles has been absent about a month, and has attended pool meetings in Chicago and New York. A Salt Lake *Chronicle* representative button-holed him in the D. & R. G. office the other morning, and proceeded to quiz him on the work done at these meetings.

"Was there anything done in Chicago that will in any way affect Utah traffic?"

"Yes; we did one thing that will be of great benefit to Salt Lake. That was raising the rates on all ore from Utah, east and west. The rate heretofore has been $6.40 to San Francisco, Pueblo and Denver, and under those rates, a good deal of ore has gone out of the Territory, especially to Colorado. At the pool meeting, in Chicago, the rate to each of the points was raised to $10. This, I think, will result in forcing all Utah ore into the Salt Lake market."

"This change does not affect the rates to Omaha and Kansas City?"

"No; but a greater part of the ore sent out of the Territory has gone to Pueblo and Denver. That will come to Salt Lake now."

"Nothing was done, of course, in relation to the Union Pacific's discrimination on Wood River ore?"

"No; that is local business. When the question of favoring Salt Lake, by raising the rates on outward bound ore was before the meeting, I suggested the propriety and justice of extending the policy to Wood River ores, but was politely informed that was none of my —— business.'"

"Is there any foundation for the report that the Utah Traffic Association will go to pieces?"

"None at all. The Traffic Association was formed for an indefinite period. Under the articles of agreement, any road can withdraw from it whenever it sees fit, by giving 90 days' notice of its intentions."

Whether the increase of rates on ore shipped to outside points will be a benefit to Salt Lake or the Territory, is questionable. It is true that the shipments of ore from this city, east and west, averages about 50 carloads per week, but a greater part of it is of such a refractory nature, that it cannot be profitably treated at the Utah smelters.

USEFUL INFORMATION.

New Applications of Paper.

Wm. J. Griffin, of the Holyoke envelope works, says the *Transcript* of that town, has invented a new application of paper. It is designed as a substitute for wood in blocks or bars, wherever a knife is used in a mechanical cutter. In the shape of bars it has been put into every paper mill in his district, where an undercut cutter is used. The Whiting, Albion, Winona, Nonotuck, Massasoit, and other mills have it. The invention is also applied to blocks for shoe cutting and cigar making. At the Holyoke envelope works it is used in the cutting blocks in the envelope cutters. One outlasts a dozen of the formerly used wooden blocks. In its manufacture, sheets of paper are compressed by enormous force into blocks or bars, as wished, harder than wood and far more durable. Mr. Griffin has just received his patents on the invention, and will now introduce them outside of Holyoke.

Still Another New Application.

Papier mache process for covering floors is described as follows: The floor is thoroughly cleaned. The holes and cracks are then filled with paper putty, made by soaking newspaper in a paste made of wheat, flour, water and ground alum, as follows: To one pound of flour add three quarts of water and a tablespoonful of ground alum, and mix this thoroughly. The floor is then coated with this paste, and a thickness of Manilla or hardware paper is next put on. If two layers are desired, a second covering of Manilla paper is put on. This is allowed to dry thoroughly. The Manilla paper is then covered with paste, and a layer of wall paper of any style or design desired is put on. After allowing this to thoroughly dry, it is covered with two or more coats of sizing, made by dissolving one-half pound of white glue in two quarts of hot water. After this is dry, the surface is given one coat of "hard oil finish varnish." This is allowed to dry thoroughly, when the floor is ready for use. The process is durable and cheap, and, besides taking the place of matting, carpet, oil cloths, etc., a floor thus treated is rendered airtight, and can be washed or scrubbed.

TO TAKE OUT MILK AND COFFEE STAINS.—These stains are very difficult to remove, especially from light-colored and finely-finished goods. From woolen and mixed fabrics they are taken out by moistening them with a mixture of one part glycerine, nine parts water, and one-half part aqua ammonia. This mixture is applied to the goods by means of a brush, and allowed to remain 12 hours, occasionally renewing the moistening. After this time, the strained pieces are pressed between cloth and then rubbed with a clean rag. Drying, and, if possible, a little steaming, are generally sufficient to thoroughly remove the stains. Stains on silk garments which are dyed with delicate colors or finely finished are more difficult to remove. In this case five parts glycerine are mixed with five parts water, and one-quarter part of ammonia added. Before using this mixture it should be tried on some part of the garments where it cannot be noticed, in order to see if the mixture will change color. If such is the case, no ammonia should be added. If, on the contrary, no change takes place, of if, after drying, the original color is restored, the above mixture is applied with a soft brush, allowing it to remain on the stains for six or eight hours, and is then rubbed with a clean cloth. The remaining dry substance is then carefully taken off by means of a knife. The injured places are now brushed over with clean water, pressed between cloths and dried. If the stain is not then removed, a rubbing with dry bread will easily take it off. To restore the finish, a thin solution of gum arabic (or in many cases beer is preferred) is brushed on, then dried and carefully ironed. By careful manipulation the stains will be successfully removed.

ONLY ONE TRUE DISINFECTANT.—Prof. de Chanmont says, with regard to disinfectants, that there is but one true disinfectant, viz., fire. The majority of so-called disinfectants are simply deodorants. The idea that tobacco smoke or the odor of camphor is destructive of contagion is still extensively held, though it is simply absurd. A true disinfectant is a substance that will kill the germ or living particle in which the contagious principle resides or through which it is conveyed. Of true disinfectants, heat is the most reliable, though odors are not to be despised, such as carbolic acid, chlorine and sulphuric gas.

EDITORS PRESS:—I notice in a late number of your paper a method of finding the height of a tree by means of a stick and circle. The following seems to be a shorter and simpler way: Place a stick of convenient length upright in the ground and measure the length above ground. Measure the shadow of the stick and that of the tree. As the length of the shadow of the stick is to the length of the stick so will the length of the shadow of the tree be to the height of the tree.

THE STORMY PETREL possesses a very large amount of oil, which, when terrified, it has the power of throwing from its mouth. In the Faroe islands the people draw a wick through its body, when it is young and fat, and, lighting the end that projects from the beak, use it for a lamp. It will burn for a long time.

ANTIQUITY OF TRADE MARKS. A foreign cotemporary has discovered that trade-marks are nearly as old as the industry of the human race. Ancient Babylon had property symbols, and the Chinese claim to have had trade-marks one thousand years before Christ. Gutenburg, the inventor of printing, had a lawsuit about a trade-mark and won it. As early as 1300 the English parliament authorized trade-marks, and the laws of America also protected them. Extraordinary means have been required at all times to guard against the fraudulent use of marks of manufacturers. If we have no means of identifying the trade-mark, the best goods at once lose their value. This was early discovered, and probably the successors of Tubal Cain were the first to use distinctive marks on their productions.

ANCIENT TOOLS.—The modern tool makers give employment to a high degree of mechanical skill, and much metallurgical knowledge is requisite for the selection of material to make first class tools. But when we reflect on the difficulties these ancient tool makers had to surmount, in fastening and retaining stones as cutters on a base of bronze, we can appreciate the perfection which their art reached. They probably followed methods of hardening copper alloys which are not known to us and are not discovered by modern metal workers, because the knowledge is not essential, but the real mystery of how clean cutting of hard substances was done in those times lay in the acquired skill of the tool makers.

THE annual statement of Wells, Fargo & Co. of the production of precious metals in the States and Territories west of the Missouri river, including British Columbia and receipts by express from the west coast of Mexico during 1884, shows aggregate products as follows: Gold, $26,256,542; silver, $45,799,069; copper, $6,086,252; lead, $6,834,091. Total gross yield, $84,975,954. California shows a decrease in gold of $944,703 and an increase of silver of $513,597. In Nevada the Comstock shows an increase of $1,668,524; Eureka district shows a decrease of $123,152, showing a total increase in the State of Nevada of $117,318. Montana shows a considerable increase; Colorado and Arizona show a decrease from the production of 1883.

THE Grand Prize mill started up Thursday night for the purpose of crushing the ore on hand at the time of the caving in of the roof, which will probably keep it busy of a couple of weeks.

GOOD HEALTH.

The Children's Hospital.

We vary the contents of our Good Health Column this week. Instead of pursuing our usual hints and suggestions for individual well-being and comfort, we give a sketch from the *Call* of an institution in our city which is doing a noble work for the little sufferers who without its aid would linger in misery or speedily perish. It is known as the Children's Hospital, on Thirteenth street. This institution was incorporated in March, 1875, under the name of the "Pacific Dispensary for Women and Children." Its object is fourfold: First, a dispensary where the sick poor can receive free treatment; second, to provide for women the medical aid of competent women physicians; third, a hospital for sick and crippled children; fourth, a training school for nurses.

The Dispensary and Hospital.

Of the dispensary it is only necessary to say that it furnishes medical and surgical treatment and medicine to over 200 women and children every month to show the place it fills and the misery it relieves. The Woman's Hospital has a double usefulness. It enables women who prefer to be treated by physicians of their own sex, and it enables these female physicians to demonstrate their fitness for the profession they have chosen, and to compete with men on equal terms. But while there are other dispensaries and hospitals for adults, this is the only Children's Hospital on the coast. An attempt was made some years ago to open a children's ward in St. Luke's Episcopal Hospital, but the scheme failed, and the whole institution was closed for lack of funds. The children's ward in the Pacific Dispensary occupies half of the double building at 221 and 223 Thirteenth street, near Folsom. Thither are sent the little sufferers from the Boys' and Girls' Aid Society, and its existence makes a "Society for the Prevention of Cruelty to Children" possible. These children are necessarily free patients, but those who are sent by their parents or under the advice of physicians pay according to their ability. It is a sorrowful commentary on paternal responsibility and maternal instinct that several times a sick child has been left at the hospital, a certain sum of money being paid in advance, and no further trace could ever be found of the people who took it there. It seemed as if the poor little ailing creatures were a burden too heavy to be carried any longer, and its natural protectors simply dropped it. There is nothing to do with such cases on recovery except to send them to the orphan asylum, unless some one adopts them. The hospital is no place for well children, and is only designed for sick ones.

Lights and Shadows.

Parting with the convalescents is one of the great griefs of physicians and nurses. To many of the little ones the hospital is the first home they have ever known—a place that will always be associated in their minds with memories of broth and wine, of lemonade and chicken, of soft clean beds and gentle kindness always, so that the pain is forgotten, and only the comfort and cleanliness remembered. There are now about 20 children at the dispensary. Of these, 6 are suffering from hip disease. The ages range from 2 to 11 years, though there is a young girl of 17, terribly crippled and distorted with inflammatory rheumatism, but she is so small and delicate in appearance that she looks like a child 10 years old. The two nurseries are pretty sunny rooms on the second floor, furnished with cribs and little low rocking chairs, besides the usual complement of lounges and invalid chairs. There is one little girl, about 5 years old, whose disease is water on the brain. The head is so abnormally large, that the child has never been able to walk, and is hopelessly imbecile. The boys far outnumber the girls, now and always. Whether it is that boys play in the street and are exposed to more dangerous accidents, or have more vitality, and resist diseases, to which girls succumb, the fact remains that the boys predominate. It was pitiful to see the sick babies in their cribs, and the older ones just able to get about on crutches, but the matron took a cheerful, hopeful view of every case, and said it would be dismissed—cured in six weeks or six months, according to its greater or less severity. She pointed out a little fellow who had undergone a painful operation a day or two before, which had engaged the attention of three physicians, but seeing a look of horror on the face of her interlocutor, she hastened to explain that the three physicians did not add to the magnitude of the operation, nor yet was it a case where, in a multitude of council, there is safety for the councilors; but that an operation, great or small, can scarcely be performed with less. One administers chloroform and watches the pulse, one actually performs the operation, and the third hands instruments, sponges, or bandages, as they are needed. The children who were not actually suffering, seemed very contented and happy. The Fruit and Flower Mission, and several church societies are very kind in sending them toys and pictures, as well as fruits and jellies. Their regular hours for meals are 7:30 A. M., 12:30 and 5:30 P. M., but it is at the discretion of the nurses to allow them a lunch, both morning and afternoon.

Training Nurses.

These nurses, eight in number, under the direction of a matron, are very attractive and interesting. They are not obliged to dress alike, except that all are required to wear white caps and aprons. One of the objects of the Hospital is to train nurses thoroughly. Very few know how much knowledge and practice are essential to good nursing, and perhaps an idea may be given by stating that this course of instruction covers two years, and includes the dressing of burns, sores and wounds, the preparation of fomentations, poultices and dressings, the best method of friction, the application of leeches and subsequent treatment, making bandages and rollers, lining splints, changing sheets while a patient is in bed, preparing food for the sick, securing proper ventilation, observing accurately the state of secretions, pulse, skin, sleep, etc. Besides this, there are lectures, recitations and demonstrations. This instruction is given mainly by the attending physician. The necessity for trained nurses is beginning to be felt everywhere. They relieve a physician of half his responsibility. The affectionate, misdirected zeal of many a young mother, who declares that no one shall touch her sick baby but herself, has lost precious lives that might just as well have been saved. A physician once dwelt with great bitterness on the death of a child from typhoid fever, as the family called it, though he insisted that the mother poisoned it as absolutely as if she had given it strychnine. He left the child entirely out of danger one day, and when he called on the next day, he saw that the case was hopeless. "What has this child eaten?" he asked. The mother hesitated a moment, and then said, "Doughnuts. He cried for them, and I thought, if he gets well it will be all right anyway, and if he does not, I should always reproach myself for refusing his last request." "Don't reproach yourself," said the doctor curtly. It would be hard to convince any mother that her sick children could be better cared for in the hospital than at home. It is true, nevertheless. They can be better nursed, better fed and better managed in every way. But if parents will not admit this, they ought at least to co-operate with a physician in efficient nursing. It is everything to him to know that his instructions will be carried out exactly.

The Sinews of War.

The Dispensary is at this moment terribly in need of funds. True, it was benefited both by the carnival and the Rosenthal exhibitions, but then its expenses are $600 a month for rent, supplies, laundry, drugs and appliances and salaries, and its income is only derived from the fees of paying patients, and a small sum from the State. The lease of buildings now occupied expires in April, and unless money can be raised to purchase or rent other quarters, the work must cease.

Passing Events.

This number of the PRESS is mainly devoted to a review of tbe mining industry for the past year. It will well repay perusal by all interested in mining matters.

The great silver convention at Denver, Colorado, will be held in a few days, when subjects of great importance to silver miners will be discussed.

The caucus of the dominant party this week agreed to nominate ex-Governor Leland Stanford for U. S. Senator, from California, and this action will probably be ratified by the Legislature in dne course.

The winter still keeps many mines idle that in a few months will again be worked, and as few prospectors are abroad in the mountains at this season, few new discoveries are recorded.

The total amount of freight—coke, copper, bullion and supplies—handled for the Old Dominion Copper Company, of Arizona, for the year 1884, was 8,884 tons, or about 24½ tons per day throughout the year. The tonnage, although large, is but a tithe of what is would be if the company enjoyed the advantage of transportation by rail to Globe. They have it in contemplation, when rail connection is secured, to greatly increase the output of copper, which necessarily implies a corresponding increase in tbe consumption of coke, which now has to be hauled by wagon a distance of 130 miles, at a cost of $35 per ton.—*Silver Belt.*

MINING IN 1884.

A Review of Operations and Results.

A Summary of Important Doings in the Mining Regions Last Year.

Never have we addressed ourselves to the task of making our Annual Rsview of the mining interests of the Pacific Coast with more satisfaction than on the present occasion. And this, not because the past has been a year signalized hy the discovery of great honanzas, the occurrence of mining booms or any unusual activity in mining transactions of a speculative kind, nor yet, because outside capital has been seeking here investment to an unwonted degree. Our satisfaction is due to none of these, but rather to the fact that the past year has been marked by such absence of these meretricious attendants, feverish excitements and doubtful aids to the mining industry, as denote for the latter a more healthful condition and a more promising future than could ever beforc be justly claimed for it. As regards au active stock market and the old-frashioned craze, leading to senseless and hasty stampedes, such as have been so much the rule in former times, they have ever worked only harm to the best interests of mining, it being an open question if the finding of the so-called bonanzas have not had a like effect. In so far as California is concerned we are able now to develop our mines without tbe aid of foreign capital, there being little trouble in getting from home sources all the money required for opening up and equipping mining properties of genuine merit, and it would be a pity to sce money put into any other, even though obtained from people abroad. While our business men and capitalists are not so ready now as formerly to embark in any wild scheme that may be presented to them, they are quite as ready as ever to engage in mining enterprises, and they go about it with more deliberation and method, requiring, as they would if about to embark in any other legitimats business, assurances beforehand as to their fcasibility and merit.

The past year cannot be said to have been an exceedingly profitable one to the mining industry in general. Tbe low price of lead and copper, and the heavy discount on silver, have militated against profit in many mining operations. There have been no special mining excitements; and while a great deal of development has been going on, the summing up of general results has not proved as satisfactory in some quarters as bad been hoped. As regards this State, the double standard question having affected the silver mining industry, there has been a demand for gold mines, and it is probable that many old mines will be reopened and new ones developed within the next year.

Before considering ths different regions it will be well to pay some attention to the statistics of bullion productions. The figures compiled by Mr. Valentine, of Wells, Fargo & Co., are generally considered the most reliable, and we give bis report as follows:

The Bullion Yield.

DEAR SIR: The following is a copy of our Annual Statement of precious Metals produced in the States and Territories west of the Missouri River (including British Colnmbia, and receipts by express from the West Coast States of Mexico), during 1884, which shows aggregats products as follows: Gold, $26,256,542; Silver, $45,799,069; Copper, $6,086,252; Lead, $6,834,091. Total gross result, $84,975,954.

California shows a decrease in Gold of $944,703, and an increase of Silver of $513,597. In Nevada, the Comstock shows an increase of $1,668,524; Eureka District shows a decrease of $123,152. In the total product of the State there is an increase of $117,318; Montana shows a considerable increase; Colorado and Arizona a decrease from the production of 1883.

As stated hitherto, the facilities afforded for the transportation of bullion, ores, and base metals, by the extension of railroads into mining districts, increase the difficulty of verifying the reports of the products from several important localities; and the general tendeucy is to exaggeration when the actual values are not obtainable from authentic sources; but the aggregate result, as shown herein, we think may be relied on with reasonable confidence as approximately correct:

STATES AND TERRITORIES.	Gold Dust and Bullion by Express...	Gold Dust and Bullion by other conveyances.....	Silver Bullion by Express.....	Ores and Base Bullion by Freight...	Total.....
California.....	$12,232,471	$614,123	$1,504,705	$ 871,639	$15,272,938

New Mexico.....	157,688	90,000	900,248	2,530,678	3,678,014
Arizona.....	390,701	100,000	3,139,628	3,455,980	7,056,379
Dakota.....	2,720,847	130,000	110,009	.....	2,930,847
Mexico(West Coast States)	235,256	.....	2,257,144	12,000	2,554,400
British Columbia.....	047,719	140,000	.....	.....	787,719
Totals.....	$23,930,303	$1,505,396	$28,343,945	$31,191,250	$84,975,954

The gross yield for 1884, shown above, segregated, is approximately as follows:

Gold, 30.90-100 per cent	$26,250,542
Silver, 53.90-100 per cent	45,799,069
Copper, 7.16-100 per cent	6,086,252
Lead, 8.04-100 per cent	6,834,091
Total	$84,975,954

ANNUAL PRODUCTS OF LEAD, COPPER, SILVER AND GOLD IN THE STATES AND TERRITORIES WEST OF THE MISSOURI RIVER, 1870-1884.

The Net Product of the States and Territories West of the Missouri River, exclusive of British Columbia and West Coast of Mexico, divided, is as follows:

Date.	Product as per W. F. & Co's Statements, including Amo'ts from B. C. and West Coast of Mexico.....	Product after deducting Am'nts from British Columbia and West Coast of Mexico.....	Lead.	Copper.	Silver.	Gold.
1870.	$54,000,009	$52,159,000	$1,080,000	.....	$17,320,000	$33,750,000
1871.	58,284,000	53,784,000	2,100,000	.....	19,289,000	34,395,000
1872.	62,236,959	60,351,824	2,250,000	.....	19,924,420	38,177,315
1873.	72,258,693	70,139,800	3,450,000	.....	27,383,302	39,216,558

The exports of Silver during the past year to Japan, China, ths Straits, etc., have been as follows: From London, $40,221,658; from Marseilles, $1,361,250; from Venice, $130,680; from San Francisco, $13,903,990. Total, $55,617,578.

According to these tables, comparing the product of last year with that of the year before, the following countries have gained in the sums affixed to each: Nevada, $110,318; Washington Territory, $6,599; Alaska, $10,014; Montana, $1,983,000; Utah, $372,152; New Mexico, $247,095; Dakota, $163,847; British Columbia, $135,703; the following show losses in the sums named below: California, $400,326; Oregon, $37,813; Idaho, $3,542,177; Colorado, $4,076,251; Arizona, $1,127,364; West Coast Mexico, $2,667,984; showing a total decrease of $5,337,658 in the bullion product of 1884 as compared with that of 1883. That there should have occurred any decrease in the case of California and Idaho is a surprise to nearly every one. The falling off in Colorado was expected; so also it was known in advance that Arizona would fall behind, owing to tbe failure of some of the big mines at Tombstone. But after saying all this there will be no lack of parties ready to find fault with Mr. Valentine's returns, and in the case of California, there would seem to be some reason to question their entire accuracy. That tbe output of silver was in this State larger than the above table gives us credit for, can, we think, be clearly established. Tbe papers pnblished in San Bernardino claim that the silver produot of tbat county amounted last year to nearly $5,000,000. The Los Angeles *Times* of January 10th furnishes the following figures showing the output of certain mines and localities in San Bernardino county, with the remark, that these figures, though not official, will be found to be very nearly correct.

Here follows a list of the mines and their products for the year in the various districts:

King	$ 800,000
Sue mine	400,000
Occidental	60,000
Bismarck	360,000
Cuba	100,000
Silver Odessa	200,000
Garfield	300,000
Other Calico mines	1,000,000
Total Calico output	3,220,000
Bonanza King, Trojan District	600,000
Waterman Mine, Grapevine Dist	1,000,000
San Jacinto mine, Pinacate Dist	100,000
Other districts	500,000
Total output for the county	$ 5,420,000

After making due allowancs for the gold contained in this bullion, we have, according to the above showing, for this county alone nearly twice as much silver as Mr. Valentine assigns to the whole of California. Ssveral other counties in the State, as is well known, turned out some of this metal: Los Angeles, Alpine and Mono each a little, and Inyo a good deal. If we were to credit the sntire number with no more than a million dollars for ths year they would, no doubt, feel much aggrieved; yet this is far more than they took out. But canvassing the pros and cons as they seem to present themselves, ths silver product of California for the year last past could not have been much less tban $5,000,000.

We incline to the opinion that Mr. Valentine bas also somewbat underestimated the gold product of the State for thc year in question, this opinion having been formed, as in arriving at the product of silver, by taking the output of a few of the more prominent mines and districts as a guide. Thus, the shipments of gold from the town of Bodie amountsd for the year to over a million dollars, the output of each mine and locality in and about that town being given below:

Standard Con	$305,274 03
Bodie Con	617,939 49
Syndicate	171,049 56
New Standard	17,714 76
Bodie Tunnel	2,075 90
Wagner's Tailings Mill	17,600 00
Virginia Creek Hydraulic Co	21,300 00
Scattering	8,630 00
Bodie Ore	714 00
Total	$1,162,297 74

The total value of bullion, mostly gold, sent from that camp to.date amounting to about $17,000,000. The shipments of gold made during the year from ths following camps, mines and localities are estimated to have been as below stated: From the Slate Cresk Basin, $1,500,000; from Forrest City and vicinity, $1,000,000; from Nevada City and Grass Valley, $3,000,000; from the Forrest Hill Divide, $1,500,000; from the Empire mine, Amador county, $1,000,000, making from these few places $8,000,000, leaving only about $5,000,000 to be made up hy all the rest of the State, $2,000,000 less, probably, than was so produced. In looking over thc State there appears to have been some little increase at nearly all the principal mining ceuters; each small in itself, but tbe whole making a considerable aggregate of gains.

It has, we believe, been the practice of Mr. Valentine, to allow 10 per cent for tbe bullion transmitted otherwise than by express. While this allowance is ample as regards the carriage of silver, it is not enough in the case of gold, which, in considerable value, can be carrisd on tbe person without much inconvenience, the Chinese, of whom thers are now about 10,000 working on their own account in our placer mines, being notoriously addicted to this manner of transmitting their earnings to San Francisco. Greater security in traveling has tended to increase this habit also, among other classes of miners, wherefors it may be concluded that such allowance of 10 per cent is not at the present time large enough to represent the amount of gold that finds its way to the mint, or out of thc country, through private cbannels.

What Mr. Valentine says touching tbe increased difficulty of verifying his reports, by reason of the extension of railroads into many important mining districts, is entirely correct; his further remark, in regard to the general tendency to exaggeration, when actual values cannot be obtained from authentic sources, being equally true.

In tbis connection it should bs observed, that in estimating tbe bullion product of California, the term covers only gold and silver; whereas, in making such estimate for Arizona, Idaho, Montana, Utah, Colorado aud New Mexico, the value of the lead and copper produced is included in the bullion production of these countries. Of the $85,000,000 produced last year,

about 20 per cent consisted of gold, 53 of silver, 7 of copper and 8 of lead; that is, the value of the silver amounted to about 8 per cent more than the value of all the others combined.

CALIFORNIA.

So thoroughly have we learned the business, and so carefully is it now being practiced in California, that mining is quite as safe as viticulture, fruit or wheat growing; if, indeed, there do not attach to it elements of certainty that can hardly be claimed for either of these industries, seeing how dependent they are on the weather and the markets; how they are exposed to suffer from competition, and how heavily they are taxed between insurance, storage, commission and transportation charges, with none of which the miner has much to do.

From what has been said above it is not to be inferred that the past has been a year devoid of solid progress and valuable discoveries, for it has in reality been characterized by both to an eminent degree. But this progress has been made in a quiet, steady-going sort of way, while these discoveries have been of a kind not calculated to breed an excitement or attract general attention. Of the latter, California comes in for a large share, these finds, consisting of both gold and silver deposits, having occurred in all parts of the State. While causing no rushes or other premature movements, these discoveries have served to keep alive a healthy interest in the business of mining, while tending at the same time to renew confidence in the mineral resources of the State, which, though the oldest of all our mining countries, presents still the best field for exploration extant.

The Advantages that California Possesses as a Mining Country.

If not everywhere recognized abroad, are coming to be pretty well understood by her own people, who, after many trials in the adjacent countries and spending their hundreds of millions to little purpose, are content now to remain at home and devote their means and energies to developing the superabundant mineral wealth of their own State. This is a wise policy. The conditions here, in whatever light we view them, are infinitely superior to those that obtain among our immediate neighbors, or perhaps anywhere else in the world. First to be considered is our unrivaled climate, healthful, equable and invigorating; so mild, even in winter, that mining operations can be successfully pursued the year round in nearly all the mining districts of the State, these districts being, with hardly an exception, accessible by railroads or good wagon roads, over which freights and passengers are carried every day in the year, and at extremely low rates. There is not a mining district in California but what can be reached in three days' travel from San Francisco—only a few but what can be reached in less than half that time. A third of the California miners get the city papers the day they are published, and fully another third early the day following.

Another advantage pertaining to the mines of California is the fact that their product is mostly gold, a metal never without a market, for which in fact the demand is always in excess of supply, no matter how large the production made, and the price of which fluctuates but little. Twenty years ago, copper in this country was worth 50 cents per pound; to-day, it will hardly sell for ten. Only a few years since, borax was selling in all the markets of the world at 40 cents per pound; at present its average price is about eight cents. The price of quicksilver has within the past seven years fallen from $1.50 to 47 or 48 cents per pound, present ruling rates. Turning to the cultivators of the soil, we find that they have had an experience not unlike that of the copper, borax and quicksilver producers. The California farmer gets for his wheat only three-quarters, while the hop grower gets for his hops less than one-quarter the price they got two years ago; certain other agricultural products having depreciated nearly as much. Very different has it been with gold. The purchasing power of this metal, except as affected by the war, has remained throughout all these years about the same, nor is there any probability that it will suffer material change for many years to come. The gold miner, in so far as the price of his product is concerned, can count his gains and make his calculations with certainty.

The titles to mining properties of all kinds have, through long occupation and our admirable code of laws relating to the subject, become so well settled that they give rise now to little contention or litigation. For life and property there is at present as much security in the mining regions of this State as in any other part of the Republic, safety, law and order being the rule everywhere. Few labor strikes or other serious disturbances have ever occurred in our mines, none of late years, and yet labor is cheap and abundant, ruling rates of wages being not much more than in the agricultural districts. The earnings of miners who work their own claims are generally liberal, and sometimes quite large, but those who work on hire receive on an average not over $2.50, or at the most $3 per day, finding themselves.

That the metalliferous territory of California is ample it is needless to say. Her main gold and silver bearing belt has a length of 500 by an average breadth of 30 miles, this being apart from several detached districts of great extent. The entire mineral territory within the limits of the State comprises an area of hardly less than 30,000 square miles, affording room and verge sufficient for a vast expansion of the mining industry, and a corresponding increase of population.

By reason of the foregoing, not to mention a variety of minor advantages, such as improved processes and machinery, cheap fuel and lumber, absence of bullion taxes, etc., we are able in this State to mine and mill with profit gold-bearing quartz that yields under the stamps not over $2.50 per ton; and where water can be had for motive power, and all other conditions are exceptionally good, even lower-grade ore than this. Of two-dollar ore California contains illimitable quantities, there being here but few mines the output of which runs as low as that, the average of the ore worked in the State being between $6 and $8 per ton.

Before dismissing this branch of the subject it may be pertinent to observe that the mineral deposits of California are of such varied character and occur under such diverse conditions as render many different kinds of mining practicable, while they tend to greatly prolong the life of the business. Thus, we have in the category of the precious metals both gold and silver mines, the later occupying a broad range and carrying ores of both the milling and smelting varieties. Of gold we have also two principal classes of deposits, vein and placer, the latter being subdivided into many different kinds, according to their mode of occurrence or the means and methods employed in working them. The leading branches of mining in this department consist of hydraulic, drift and river-bed operations, beach and bar washing, booming, seam digging, etc., constituting minor branches of the business. Something is also done at rewashing the tailings that have accumulated in the river beds and along the ravines, an end generally effected by means of an open cut run below the deposits, and through which they can be run off. In no other country do the gold deposits occur under so many different forms as in California, nor do the natural facilities for working them exist elsewhere to the same extent as here. Little need have the inhabitants of this State to go outside its boundaries in search of mineral deposits or suitable opportunities for securing and working them.

Of the Mineral Discoveries Made in California During the Past Year

Although quite numerous, not more than a few, being such as have special significance, can be described or even more than alluded to in a review like the present, the scope of which must necessarily be very general. Conspicuous among these finds is that known as New River, a locality in the northwestern corner of Trinity county, where, according to well authenticated accounts, a series of rich, but not very large, gold bearing quartz lodes were found located and partially developed the past summer and autumn, the number having been increased as exploration has been extended up to the present time. We know how prone most men are to exaggerate and even willfully misrepresent the facts in a case of this kind, and therefore caution our readers against being misled by statements emanating from the over sanguine or self interested. But, while doing so, we incline to the belief that this New River discovery is really one of considerable magnitude, possibly one of the first importance. When, as in this instance, merchants, bankers, steamship and real estate owners, lumber manufacturers and other like substantial business men proceed in a quiet way to largely interest themselves in mines, most of them doing so only after personal inspection, the fact constitutes a strong argument in favor of their merit. These New River lodes have also been indorsed by many experts and practical miners, who have visited and examined them, and this, in so far as we know, without dissenting opinions. As not much exploration has been done the question of their permanence remains, of course, to be determined, there being no doubt as to their considerable number, tolerable good size and high grade ore. The geological formation is favorable and the climate a good one, the snow never falling to a greater depth than eight or ten inches, and hardly ever lying more than a week at a time, even in the severest winters. The district is well-watered and heavily timbered, but remains one of the few in California that are without wagon road communication with rail or navigable waters.

This deficiency will, however, soon be supplied, arrangements having been made for building a wagon road from Humboldt bay to the mines the coming spring.

Many other finds of auriferous quartz have been reported during the year as having occurred in various parts of the State, Shasta, Sierra, Placer, Calaveras, Nevada, Inyo and Kern counties being the sites of what seem to be the more important. Meantime, several rich silver bearing lodes have been found, mostly in the Calico and adjacent districts in San Bernardino county. Argentiferous veins carrying heavy bodies of ore have also been met with in Shasta county; and notwithstanding the ore here is extremely rebellious, the silver being combined with iron, copper, antimony and other refractory metals, there is little doubt but these veins will be extensively and profitably worked in the near future.

Hydraulic Mining.

Most of the larger hydraulic mines in the State having been stopped running by legal process, the total product of gold has been diminished thereby, to the extent of two or three million dollars per annum. This deplorable necessity, if necessity there existed for such action by the courts, has caused much distress to the inhabitants of the districts most affected, while it has so diminished the yearly output of gold, and financially ruined many who had invested largely in this branch of mining. As the months go by, the hardship caused by those extreme measures, becomes more and more manifest, and there is fast being developed a public sentiment that will demand some relief for these sufferers through legislative action, if none can be procured through the courts. The hydraulic miners were willing to comply with the requirements of Judge Temple's decision, which permitted them to continue operations after making such provision for impounding their tailings as satisfied the court. By Judge Sawyer's decision, they are not permitted to do this, but are absolutely prohibited from working their claims, the court assuming their inability to so dispose of this material, that it will cause no serious harm to other interests. While some of these companies do not, perhaps, possess such natural facilities as would enable them to construct effective retaining dams, the most of them would be able to erect such structures, and these latter ought to be allowed to at least make the experiment.

A number of these companies, since being stopped from hydraulic washing, have tried the plan of working their ground by the drift method, which has in some cases proved successful, while in others it has resulted in failure.

With the closing down of so many mines in the central counties, the Trinity, Salmon and Klamath rivers, in the northwestern part of the State, are likely soon to become the more active centers of hydraulic operations, there being no likelihood of such operations ever being there interfered with by judicial proceedings. The waters of these rivers find their way to the ocean through deep, narrow canyons, along which there are no farming lands of any extent, none whatever so situated that they can receive any damage from the hydraulic slums. As these streams are not navigable, and the Klamath, which receives the waters of the other two, debouches directly into the ocean, there being no bay or harbor at its mouth, it follows that no injurious filling up or shoaling can there result from these slums, however great the quantity discharged from the hydraulic mines. The auriferous gravel banks along the Klamath, are said to be very extensive, occuring in bars and benches for nearly a hundred miles on either side of that stream. These gravel deposits are rich in gold, and enjoy entire freedom from the volcanic ash and lava flows that so encumber many of this class of deposits further south, rendering the working of them by the hydraulic process difficult and expensive or preventing it altogether. Water in great abundance can be introduced upon these Klamath mines at little cost. They can also be outfitted at small expense, lumber in that country, which is everywhere well timbered, being extremely cheap. The winters are mild, it being possible, in so far as climate is concerned, to continue gravel washing the year round, as is done by such companies as have taken the trouble to provide themselves with a steady supply of water. A good deal of attention is now being turned to that section of the State, where a number of important hydraulic enterprises will, in all probability, be set on foot within the next year or two.

The past, with the companies that have been permitted to run, has been a fairly prosperous year in hydraulic mining, while the incoming year seems to be opening auspiciously for that interest. Already this class of miners, having a good supply of water, are actively at work, with the prospect of an average good season before them.

In the Department of Drift Mining,

Operations during the year have been unusually active and generally successful, there having occurred fewer failures perhaps than ever before, while the new departure of the hydraulic companies, as noted, has added considerably to the output of this class of mines, a number of new claims have also been brought to a productive condition, some of the old companies having meantime made an excellent year's work. The Forrest Hill and San Juan divides, with various other localities in Placer and Nevada counties and also in Butte, Plumas and Sierra counties, have continued to be the principal sites of drift mining. A great deal of preliminary work has also been done in the neighborhood of Slate creek, which the current year promises to become the theater of active drift operations.

In Sierra county during the past year the mines have done pretty well. The Bald Mountain Co., at Forest City, have been engaged during the year in coming back with pillars in their extensive drift mine, and realized handsomely. The Bald Mountain Extension Co. have cleaned up from the gravel taken out of the South Fork claim, through which they are following the lead back to their own channel, nearly $70,000 for 1884, over $40,000 of which has been paid out in wages. They will be working the pay channel on their own ground by the first of May. Beyond a lava flow, 1,100 feet in width, the extension of their lead has been found, which, without doubt, extends for miles up the Pliocene ridge, insuring all the lucky stockholders a handsome fortune. A large, well-washed quartz boulder ceils one of the breasts. An incline, at a grade of one foot in four, is being put up 240 feet through the lava to reach the channel over 50 feet above the main tunnel, only 40 feet of which remains incompleted. The loaded cars going down will haul up the empty ones. On the completion of the incline, about February 1st, the working force will be largely increased. The gravel is so rich that large specimens are frequently found in the breasts, and pays $5 per carload. It is believed that a gold lead lies under the lava flow, which will be prospected in time, so more good news can soon be looked for from the Extension. At Alleghany the drift miners have realized very fair returns from their claims. Two quartz ledges are now being successfully worked in Slug canyon, at Downieville, one with a mill and the other by an arastra. The Sierra Buttes quartz mine, Sierra City, owned by London capitalists, continues to yield good and steady dividends. Three hundred men are employed. The drift mines at Gold Leake, on the numerous forks of the Yuba, Goodyear Bar and in Northern Sierra, have during the past year contributed largely to the world's store of gold. These mountains are inlaid with precious metals, only awaiting the talismanic influence of capital to reveal their untold wealth. The Alaska quartz mine, at Pike City, is very rich, and promises to soon enrich its fortunate owners. The late rainfall was joyfully welcomed by the miners, as it enables them to resume work in

their claims. Sierra county is one of the best fields for lucrative investments of capital on the Pacific Coast, and will be more appreciated as its vaults of gold continue to liberally swell the treasuries of the world.

River-Bed Mining

Finds most encouragement in the northern part of the State, being extensively engaged in along the Trinity, Salmon, Scott and Klamath rivers, where the conditions for pursuing it are unusually favorable. The year, under consideration, proved to this class of miners a good one, the water having remained at a low stage until late in the fall, thereby securing to them a long working season, a condition on which their success is always mainly dependent. The river beds in the more central and southerly counties, having been pretty well worked out years ago, are now the sites of but few operations of this kind, those carried on there now being mostly by the Chinese, who pursue the business here as elsewhere, only in a limited way. Nevertheless, they find it profitable and neglect no opportunity that offers for buying river-bed claims, which are worked generally by companies, each member of which has an interest in the venture. Great numbers of these people engage in river-bed mining along the Trinity every summer.

Silver Mining in California.

Having, within the past few years, attained very respectable proportions, some remarks on the condition and prospects of that industry are now in place. At one time considerable silver was produced at the Cerro Gordo mines, Inyo county, as much as six or seven million dollars having been turned out there between the years 1872 and 1878, the total product of this metal made in the State up to this time amounting to about $30,000,000. Not until the discovery of the argentiferous deposits in the Calico District, San Bernardino county, however, did silver mining in California promise to grow into a largely productive, profitable and permanent business. Although this discovery occurred only about three years ago, these mines have since turned out nearly $10,000,000, and that without the aid of much capital, except what they have themselves produced. Meantime explorations have brought to light many other silver lodes in that region of country, leading to the organization there of several mining districts in addition to Calico, the more important of these, so far as production goes, consisting of the Trojau, Grapeviue and Pinacate, the Ivanpah and Providence Districts lying to the north and east of Calico, having been organized many years ago.

Calico, the most central, promising and productive district and site of the original discovery, is situated in a rugged mountain range at a point seven miles north of Daggett, a station on the Atlantic and Pacific railroad. The district is in the very heart of the Mohave desert, the country for many miles around being timberless, barren and arid in the extreme. The geological formation is, nevertheless, favorable for the occurrence of rich and permanent silver-bearing deposits, consistiog in the main of porphyritic rocks. The veins, not generally large, are yet compact and shapely, and staud at nearly all angles from vertical to horizontal. The ores are of several varieties being composed mainly of horn silver, chlorides of silver, red silver ore and uative metal. They are all of the free milling variety, being as easy of reduction, perhaps, as any ever found. There are now eight or ten mills running in that section of country, none of them expensive or of large capacity, but all kept fully employed and all making money, custom mills receiving $20 per ton for working ore. More mills are needed, and it is expected that a number of new ones will be put up the comiug summer. The output of the mines will he much larger this year than last, and it is probable that the product of the country will steadily increase for several years to come, as the ore bodies already partially developed hold well in depth, and many of the districts in which hut little work has yet been done appear to have a promising future before them.

Outside of San Bernardino county we have in California a great extent of argentiferous territory—enough in Inyo county alone to constitute it a prolific and profitable producer of silver were this class of its resources fully developed, as there is reason to believe they soon will be, now that a railroad has penetrated that region. There occur heavy deposits of silver ores in Mono, Alpine and Shasta counties, hut they are generally base or of the varieties that require reduction by smelting, for which, and other reasons militating against their economical handling, very little has as yet heen done with them. After a time, and perhaps before long, these deposits will all he worked, and their product, coming in to supplement that of the still more important fields farther south, will advance California to the front rank among the silver-producing countries of the world.

Quicksilver.

The production of this metal in California has for several years past been declining at a rate that has only to go on a little longer to carry it to the vanishing point altogether. As compared with 1883, the production last year shows a falling off equal to 14,812 flasks, with little prospect that the ou'put will he increased the current year, if indeed the downward tendency shall he arrested.

As will be seen hy the appended tahle of production, for which we are indehted to Mr. J. B. Randol, of the New Almaden mine, all the mines have decreased their production. Not only have most of the smaller mines been closed, but some of the larger ones as well, and if we are to believe reports, others are to follow. The price of quicksilver has heen low, though it is now somewhat improved.

The Altoona mine, Trinity county, which has been closed for several years owing to legal complications, is to he worked again, the legal troubles having heen adjusted. As regards the numerous mines in Napa, Sonoma, San Luis Obispo and elsewhere in the State, that were forced to succumh to the accession of low prices for quicksilver, there is little chance of work being resumed upon them even with the present improved market, as much money would he required to put them in productive shape, only a few of them ever having heen thoroughly opened or properly equipped. From some of them the plant has heen removed, on others the sbafts and tunnels have caved in, and it is highly probable not a few have been ahandoned altogether. Little therefore need be expected from any of these mines, at least for the present.

SAN FRANCISCO, Dec. 31st, 1884. Production of Eld. and Napa Con. not segregated in former years.

Useful Metals and Minerals.

Besides quicksilver we mine and smelt or otherwise reduce a variety of the other useful metals; lead, copper, iron and antimony, all, as yet, in a rather limited way, though the most of these occur here in great abundance. Among mineral substances we utilize our deposits of coal, salt, horax, asphaltum and petroleum extensively—also collect a little chromium asbestos, gypsum, mica, sulphur, graphite, manganese, etc. We hurn yearly immense quantities of lime, manufacture the useful clays into stoneiron wares, pottery, terra cotta and bricks; quarry huilding stones of every description, including several varieties of marble—also granite and hasalt for street paving purposes, our resources as regards the most of the natural products being ample, and that these developments will keep pace with the general progress of the State may reasonably he expected.

ARIZONA.

Notwithstanding the fact that Arizona mines which first gave the Territory its reputation, were those of silver, and that this class of mines are still yielding largely, of late the wonderful copper production of the region, has drawn more general attention to its universal resources than the mines of precious metals.

Wells Fargo's report gives the following figures for Arizona, of the precious metals which have passed through their hands during 1884:

Gold dust and bullion by express	$ 360,791
Gold dust and bullion by other conveyances	100,000
Silver bullion by express	3,139,628
Ores and base bullion by express	3,455,960
Total for the year	$7,056,379

The report shows a considerable falling off from the product of 1883, hut when we remember that the Tombstone mines were shut down for a number of months, the amount shipped is decidedly flattering, and indicates that other portions of the Territory are heavy producers.

As showing the wonderful increase in the yield of Arizona, since the opening of the Southern Pacific Railroad, we give the figures compiled by Wells, Fargo & Co's Express, for the past six years:

Production for 1879	$1,042,403
" " 1880	4,472,471
" " 1881	8,198,766
" " 1882	9,298,267
" " 1883	8,183,742
" " 1884	7,056,379

From being seventh in the list in 1879, Arizona became fifth in 1880, fourth in 1881, third in 1882, fourth in 1883, and fifth in 1884. A large quantity of rich ore and hase bullion, which finds its way out of the country, is not included in the ahove, and it is safe to estimate the value of such ores and hullion as 10 per cent of the figures given. Mr. Patrick Hamilton, in his *Resources of Arizona* says: From the most careful estimates and reliahle data from every county, the total yield of gold, silver and copper for 1883 was $12,000,000. There is no mining region on the coast or east of the Rocky mountains that can make a more flattering showing. Facts speak louder than words, and Arizona points to her record in the past as an earnest of what she will do in the future.

The copper product of the Territory for the past five years has heen, as near as can he ascertained, as follows:

Production for 1880	2,000,000 lbs.
" " 1881	5,000,000 "
" " 1882	15,000,000 "
" " 1883	24,500,000 "
" " 1884	27,006,481 "

The value of the product for 1883, even with the low price of copper, reached nearly $3,000,000, or nearly one-third the entire hullion yield of the Territory. The growth of this branch of the mining industry of the Territory has heen something remarkahle. Ten years ago there was only one furnace in the country—a primitive concern in the Mexican style—with a capacity of from one to four tons daily. Now there are in active operation over 20 furnaces, with a capacity of over 1,000 tons.

The past year can hardly he said to have heen a prosperous one for Arizona miners. The strike among the Tombstone miners lessened the production of Cochise county, and only a part of the miners in the camp mentioned are at work. The Contention produced in 1882 $1,676,705 from 25,017 tons of ore; in 1883 it produced $553,085 from 13,652 tons; in 1884 the production was small. The Grand Central, which started milling in March, 1881, has produced over $3,000,000. Last year the mine was practically a non-producer. The Tombstone Mill anc Mining Company own 11 claims, among them the Toughnut and Goodenough claims. They hegan mining in 1878 and milling in June, 1879. From June, 1878 to March 31, 1883, they produced iu hullion $2,870,787, mainly in silver.

The summary of the year's operations in Arizona, given in the Tucson *Star*, is more statistical than any other, and though some of the figures are estimated they may he considered approximately correct.

The silver and gold output for the Territory during the year was considerahly less than for 1883. This falling off was the result of several causes, the most natural heing that of the miners' strike in Tombstone, the principal hullion producer in the Territory. The strike continued for ahout four months, which caused an entire cessation of all operations, added to this the fact that water has been encountered in in such large quantities that the lower working of the mines cannot he operated until pumping machinery is put in place. Both the Contention and Grand Central mines have heen practically non-producers during the year, hut the year 1885 promises better results, not only in Tombstone, hut many other districts, especially that of Quijotoa, will add large returns to the precious metals during the year. The output given helow is not as full and correct as might be desired; but we helieve it will not fall much helow the correct figures. Besides gold and silver there was a considerahle quantity of lead produced, which is not given. The Benson smelter and the United Verde make the most encouraging showing. The latter shipped $900,000 in copper hullion and $300,000 in silver bullion, and Benson smelter ahout the same amount. The output, however, as stated helow, representing the total value of silver, copper and lead of the Benson works:

TOMBSTONE SILVER.

T. M. & M. Co., gold 33,752, silver 397,326	$ 435,018
Grand Central	483,882
Boston Custom Mills	106,888
Benson Smelter (value of total product)	898,800
United Verde	300,000
Yekel Mine	88,000
Jesse Benton	48,300
Shipped through Yuma express office	191,940
Shipped through Tucson express office	136,032
Total	$2,683,920

ESTIMATED.

Yavapai county, not reported	$ 450,000
Mohave county, " "	250,000
Arizona Central	60,000
Silver King	800,000
Pinal Consolidated	20,000
Head Center	25,000
Mineral Hill	15,000
Golden Rule	30,000
Tevis District	12,000
Districts not mentioned	600,000
Total	$4,959,920

Among the famous mines of this Territory is the Silver King, which has yielded over $5,500,000, and paid the stockholders $1,375,000 in dividends, without any assessments ever having heen levied on the stockholders. The mine was worked by private parties until May, 1877, when it was incorporated. Last year has not been so favorahle for a large production as in the preceding years, and the expense has been somewhat proportionately greater, consequently the profits have been less, the dividends paid heing paid $50,000, with a halance on hand December 31, 1884, over and ahove all indehtedness. The leasing of the Windsor mill of five stamps has proved profitahle to the Silver King Company, where ore that could not he profitahly concentrated has heen reduced to hullion hy amalgamation.

The following figures show the receipts and dishursements for the year 1884:

Dr.	
To balance on hand Jan. 1st	$25,150.65
" sale of bullion	48,587.83
" sale of concentrator	427,811.04
Total	$501,555.52
Cr.	
By sampling and assaying	$331.50
" expenses	8,293.37
" insurance	750.00
" freight	25,655.26
" merchandise, timbers and lumber	46,412.14
" dividends Nos. 44 and 45	50,000.00
" Superintendent's drafts	337,054 41
" balance on hand Dec. 31st	33,008.87
Total	$501,555.52

The Quijotoa mines, which created some excitement two years since, when the honanza firm became interested in property in that camp, have not made any brilliant record so far, although much is expected of them. The mines are heing developed, however, and have heen listed on the San Francisco Stock and Exchange Board.

Of course, in the course of a comparatively hrief review such as this, it is not possible even to mention the many camps or mines in the Territory. Outside of the gold, silver and copper, there are deposits of coal, petroleum, etc. Mr. Hamilton says: "Large dcposits of salt are found in different parts of the Territory. Along the Salt River canyon, in Gila county, there are a number of bluffs from which salt oozes through the rocks and crystallizes. This salt is of an excellent quality for all domestic purposes, and will no doubt yet he utilized for dairying and stock raising. There are also large salt deposits in the neighborhood of Fort Verde, Yavapai county. This salt contains quantities of soda and magnesia, and is used largely hy stock growers. Besides the mineral deposits here described, there are many other rare and beautiful varieties, which to

treat in detail would require a volume. Mica is found in every county in the Territory, and some very clear and beautiful sheets are frequently encountered. In the Tonto Basin, near Salt river, there are large deposits of asbestos; fibers are long, white and of a delicate texture. No attention is now paid to the article, but cheap transportation will yet make it valuable. Iron exists in all parts of the Territory, and some very fine deposits of bematite are found in Gila county. Beds of fine, clear alabaster have been discovered in the Graham mountain, and marble of a fine quality is encountered in the Santa Catalina range. Antimony assaying eighty per cent has been located in the Chiricahuas, and tellurium has been found in the Sierra Prieta."

Copper Product.

The copper product of Arizona for 1883 was put at 25,470,734 pounds. The output for 1884, as far as heard, foots up in round figures to 27,000,000 pounds; and although a large number of copper-producing mines closed down last year, owing chiefly to the high cost of fuel and transportation, yet the product, instead of falling off, was advanced more than two million pounds. The outlook for 1886 assures us that the output will be very large—not less than 50,000,000 pounds—as there are several large prospective producers, two of which are in operation, and the other will be early during this year.

The following are the estimates for 1884. There are several small producers not heard from, and while the estimate contains the value of copper ore shipped from southern Arizona, as far as could be learned, yet there has been a large quantity shipped from northern Arizona not reported. The figures given are official, except when marked estimated:

Copper Queen	8,048,000
Detroit Copper Company	3,000,405
Old Dominion	5,125,000
Arizona Copper Company (Clifton), estimated	2,225,000
Cochise Copper Company	607,632
United Verde	5,000,000
Copper Prince (ore) produced bullion	545,000
From ore shipped from Benson	082,030
San Carlos (estimated)	125,000
Copperosity	112,000
Casa Grande	78,847
Bullion from ore shipped from various districts	984,074
Estimated bullion from copper matte	263,493
Total	27,006,481

COLORADO.

The State of Colorado, as has been the case for some years, still holds first position in the list of bullion producing regions, notwithstanding her product last year is $4,076,251 less than in 1883. Colorado is about $5,000,000 ahead of California last year. The output of the Leadville District in gold, silver and lead for the year 1884 was $12,392,400, an increase of $2,134,400 over 1883, with a number of mines that produced largely in 1883 closed during the greater part of the year on account of the low price of lead. The chief of these was the Silver Cord, one of the heaviest producers in the district. The product of lead alone was 46,800 tons, a considerable increase as compared with 1883.

As Leadville is the most important camp in the State, and produced more than half of the total yield of Colorado, consideration of its output is of great interest. The Leadville *Democrat* took great trouble in ascertaining details from the people in charge of smelters and samplers, and presents the following figures:

The smelters of Leadville report the following production:

	Bullion, Tons.	Lead, Tons.	Silver, Ounces.	Gold, Ounces.
Arkansas Val	9,026	8,978	1,404,156	5,764
American	8,000	7,968	775,000	5,500
La Plata	5,252	5,187	1,568,688	2,466
Harrison	5,095	5,962	935,124	1,484
Pryer Hill	4,549	4,523	617,955	3,412
Manville	2,659	2,638	511,801	1,000
Total	35,481	35,256	5,812,124	19,570

The total value of the above is computed as follows:

35,256 tons of lead at $3.65 per 100	$2,573,688
5,812,724 ounces silver at $1.10	6,393,996
19,576 ounces of gold at $20	391,520
Total metallic product of smelters	$3,259,204.00
The Omaha and Grant sampler received 53,000 tons of ore, containing 10,001 tons of lead, valued at $3.65	780,443.00
1,215,549 ounces of silver, valued at $1.10	1,337,104.00
	$2,117,547.00
6,272 ounces gold at $20	125,440.00
	$2,242,987.00
Of this one-tenth was transferred to Leadville smelters	224,299.00
Value of shipments to Denver	$2,028,688.08

The gold in the ore came largely from the Lilian Mining Company,

The Arkansas Valley sampler bought for outside parties 2,637 tons of ore, dry weight, containing 1,686.6 tons of lead, valued at $3 65	$123,121.00
257,421 Ounces silver at $1.10	283,164.00
	$406,285.00
The Colorado Smelting Company, of Pueblo, received, dry weight, 7,485 tons of ore, containing 1,024 tons of metallic lead, valued at $3.65	74,752.00
394,057 ounces silver, valued at $1.10	433,463 00
	$508,215.00
About 20,00 thousand tons of iron were shipped to other parts of the valley and Utah, valued at 85	$100,000
About 1,000 ton of lead ore to Utah, valued at	20,000
Our Lake county placers produced in gold about	30,000
The stamp mills are estimated to have produced in gold	10,000
And in silver	30,000
Total	$190,000

The Pueblo Smelting and Refining company received its shipments from Leadville chiefly through the Arkansas sampler.

Following is a recapitulation of the various sources of mineral production:

Product of smelters	$ 9,259,204 00
Shipments by Omaha and Grant	2,028,688 08
Shipments by Arkansas sampler	406,285 00
Direct shipments to Colorado Smelting company	508,215 00
Shipments of iron ore	100,000 00
Shipments of lean ore to Utah	20,000 00
Placer product	30,000 00
Product of mills	40,000 00
Grand total	$12,392,392 00

The following is the total lead tonnage:

By Leadville smelters	35,256
Shipped by Omaha and Grant, less ten per cent. which remained in Leadville, 10,611	9,622
Shipped by Arkansas sampler	1,086
Shipped to Utah, 25 per cent. of 1,000 tons	250
Total tons	46,814

The above figures prove that the silver grade has somewhat increased, and that the ore value has largely improved by the increase of gold therein, while the lead product is far below that of last year.

Clear Creek county is supposed to have produced more ore in 1884 than any previous year, it being acknowledged that the large figures given a few years since were exaggerations. Last year's output illustrates the fact that Clear Creek county has arrived at a season of substantial prosperity. It is not of a spasmodic, but solid nature, and has many peculiarities.

The Georgetown *Courier* says: There are a number of ore buyers in Denver who have been in the Clear Creek market, and turned their purchases over to the smelting works who put the ore under the head of "miscellaneous." To get at anything like an accurate report, the amount purchased by Denver ore buyers must be known. But one of these firms have made a report. Mathews & Webb, in their circular, give their purchases in this county at $222,028.60.

Following are the only reliable figures yet obtained regarding the production of this county:

Boston and Colorado Co	$918,000 00
Golden Smelting Works	284,357 00
Mathews & Webb	222,028 60
Freeland smelters	344,009 00
Gold purchased by bank of Idaho Springs	12,550 52
Gold purchased by banks of Georgetown	8,000 00
	$1,860,936 15

The Grant smelting works, Pueblo smelting works and a number of Denver ore buyers are yet to be heard from. The Grant works are thought to have handled over half a million dollars' worth of our ore.

But meager reports have been obtainable from the gold producers. A great part of the gold from Empire, Fall River and Idaho was sold to Central City banks, which Gilpin county gets credit for. A great deal of ore has always been sent to Gilpin county.

The Freeland smelter produced in 1884, $281,000 gold, $60,000 silver and $3,000 copper. Total, $344,000.

The total weight of ore shipments from the Georgetown depot during 1884, was 14,422,400 pounds, or 7,211 tons, valued at nearly one million dollars. There were 654 cars, 206 of which were sent to Argo, 357 to Denver, 85 to Golden, 4 to Idaho and 2 to Black Hawk.

The many changes in the management of the sampling works at this end of the county prohibits the getting of figures from that source. Nearly all the ore purchased by the Silver Plume works and the Miners works of Georgetown during the early part of 1884, was shipped to Pueblo smelting works. These works have not reported.

The Public Ore Market of Georgetown handled during 1884, 3,683 tons of ore, valued at $513,000. The average value of the ore was $139 per ton. These works ran steadily during the year, and were under the management of Morris & Duncan until the first of September, when Mr. Morris sold his interest to Mr. M. Wheeler.

The works of G. W. Hall & Co. were in steady operation throughout the year.

In February, 1884, Messrs. W. A. Duff, J. M. Sayles and E. C. Billings re opened the Silver Plume works and the Miners works of this place. The former shut down in October and the latter in November.

The Rocky Mountain works were run for a number of months during the early part of the year, under the management of Jas. A. Noone.

The Boston and Colorado works furnish the following statement of their business for 1884:

	Gold.	Silver.	Copper.	Total.
Clear Creek	$210,000	$652,000	$ 56,000	$918,000
Gilpin	083,000	170,000	108,000	961,000
Boulder	128,000	59,000		197,000
Lake		68,000		68,000
Summit		124,000		124,000
Park	11,000	108,000	1,000	120,000
Gunnison		83,000		83,000
Custer	3,000	4,000		7,000
Hinsdale	2,000	3,000	7,000	12,000
Saguache		11,000		11,000
San Juan	2,000	6,000	3,000	11,000
Ouray	1,000	4,000	2,000	7,000
Chaffe		11,000		11,000
California	2,000	30,000	3,000	41,000
Idaho Territory		4,000	2,000	6,000
Nevada	2,000	5,000		7,000
New Mexico	45,000	59,000	11,000	115,000
Arizona		30,000	11,000	41,000
Utah	3,000	45,000	23,000	71,000
Montana	46,000	432,000	220,000	689,000
Mexico		37,000	1,000	38,000
Miscel's	211,000	619,000	38,000	868,000
	$1,350,000	$2,566,000	$486,000	$4,411,000

Following are the purchases of the Golden Smelting Works:

	Tons.	Gold.	Silver.	Lead.	Total.
Clear Creek	2,138	$ 7,696	$228 145	$48,533	$284,375
Gilpin	5,940	180,446	60,545	6,462	247,453
Boulder	676	76,386	18,839	428	95,855
Lake	587		42,236	13,941	56,178
Summit	45	475	1,196	1,420	3,092
Park	9	141	376		518
Saguache	155	81	1,544	5,440	7,066
New Mexico	16		3,859		3,859
Miscellan's	355	8,238	5,387	5,150	18,776
	9,921				$717,172

The average value of the ore treated by these works from this county is $133 per ton.

The Central City *Register-Call* puts the product of Gilpin county for 1884 as follows:

Smelting ore	$1,122,975 00
Tailings	413,526 00
Gold shipments by banks	990,900 00
Individual shipments	54,501 00
Miscellaneous	7,500 00
Total	$2,656,901 00

The total product for the previous year was $2,208,989, which shows an increase for the year 1884 of $447,912. This is surely a most excellent showing and every man in Gilpin county is proud of it. For a county so small as Gilpin and one that has been mined vigorously for a quarter of a century the product for 1884, standing without comparison with the previous year, is truly marvelous. It speaks volumes for the fissure veins of the county, which holds out so well. The deepest mining in the State is done here and also the oldest.

The Idaho Springs *News* makes the following statement of the ore business in that vicinity:

Purchased by the sampling works from May 1 to Dec. 31, 1884:

Silver	$90,661 57
Gold	56,760 60
Lead	37,164 60
Copper	7,529 54
	$192,116 21
Estimated value of ore produced from Jan. 1 to May 1, 1884	$100,000 00
Estimated value of gold sold and ore treated at Central City	50,000 00
Freeland smelter and H. & W. mine	590,000 00
	$842,116 21

From Crested Butte the ore output does not seem to have been so much as was expected. The Forest Queen, one of the heaviest producers, has been idle while the concentrator was being put in. The Ruby Chief is flooded with water. The Elk Mountain *Pilot* says: Our mineral output the coming season will be at least three times as large as for the season just past. Our coal output also bids fair to double its present proportions in a couple of seasons if rates can be had by other companies that are equally as advantageous as those which the present companies enjoy. It is well to say that this corporation is the life of Crested Butte, but were it not for the discriminating rates which it has forced upon other producers, Crested Butte would be to-day a city of three thousand instead of fifteen hundred inhabitants.

The output of Ouray county for 1884 is an enviable increase over the preceding year, and yet several hundred thousand less than we expected in December last, when the outlook for the D. & R. G. Railroad was considered flattering, and the disastrous slides of Dec. 18, 19 and 22, had not been visited upon us.

The *Muldoon* says: The season of '84, owing to the unprecedented snow-fall during the closing weeks of '83 and early months of the present year, delayed shipping until July, when the high water interfered, and added four weeks of paralyzation; but in spite of all obstacles intended to impede and embarrass we get to the front in enviable shape, and still maintain our position as the banner county of the San Juan. The estimates are made upon net figures garnered from mines, mills and managers, and in many instances yielded (on account of the war on silver), very reluctantly and then only with the promise on our part that the districts should be listed as a whole, and the names of the mines in the list of producers, but not the yield of each property, or the names of the owners itemized separately. The estimate for Mt. Snellles, Poughkeepsie, Uncapahgre, Bear Creek and Dallas districts is $350,000, of which the Virginias, Monongahela and Sidney have produced the lion's share, and one of which (the Sidney) is still shipping. In Poughkeepsie the county line runs north of the water shed or summit, and the two heaviest producers, Old Lout and Alaska, are in San Juan county, although tributary to Ouray and finding an outlet via Montrose. The Alaska output was shipped to Silverton and marketed at the sampling works in that very prosperous camp.

In Pitkin county, the Aspen *Times* says the prospects of the camp were never brighter; some of most conservative men, who are in a position to know, think that Aspen's mineral output for 1885 will easily reach $10,000,000. The smelter blew in July and has produced nearly $500,000, while there has been a gross production of mineral wealth during the year past of nearly $1,500,000. We have no desire to call a grand rush of laboring men here until the development is sufficient to employ them. Capital is fast coming to the rescue, and the day is not far distant when Aspen will rival any camp in the State, not excepting Leadville. Heretofore we have given that camp the exception, but as pointers now indicate Aspen will equal if not excel Leadville in profitable mining.

In making a summary of the mineral output of the entire Elk Mountain country, the *Pilot* has been at no little pains to obtain figures that are as near accurate as possible. Trusting that there will not be too wide a breach between our figures either way, we place before our readers the product of the mines from this entire Elk Mountain country, which finds its egress at Crested Butte. Owing to the facilities we have to get these figures we think the parties interested will overlook all mistakes. The figures concerning the mineral shipments from Crested Butte for the year ending December 31, 1884, are as follows:

From	Tons	Est. Value of Ore.
Forest Queen mine	260	$ 36,400
W. H. Con	20	2,000
Augusta mine	250	20,000
Domingo	70	4,500
Aspen S. Co (bullion)	20	10,000
" " " (ore)	60	6,000
Montezuma	80	8,000
Little Crown	10	1,000
Excelsior	40	2,800
Sylvanite	40	25,000
Tam O'Shanter	20	1,000
Bradburn	10	1,000
Black Queen	80	5,000
Rose Sampling works	80	10,000
Total output	1040	$133,600

From the above figures it is well known that every mine there mentioned is undergoing development, with perhaps the exception of the Forest Queen, and the attention of that company has been directed toward building a mill all summer. This seems to have been a year of experiments and developments, with a view of future production. The most of the companies above named are really in a condition to make large outputs the coming year, and we sincerely expect to make a much better showing than we are able to at present.

In the above tables we have only enumerated the ore shipments that were direct, and it will be seen that the Rose sampler handled 80 tons that were principally in small lots. These small lots are from the following claims: Milwaukee, Gov. Tabor, Iron Duke, Silver Spruce, Buckeye, Excelsior, Iron King, Niagara, Maryland, Belle of Titusville, Ohio, Republic, and Hudson, all of the Rock Creek country. Then the Michigan from Ashcroft, the Jacob Strader from Poverty gulch, the Great Eastern, Little Crown and Eureka, of Irwin. Here are 18 claims, the most of them just made their first shipment of say from one to five tons just as an experiment. In almost every case the shipment has been a success.

In San Miguel county it was difficult to get exact returns, because mine owners objected to giving them. The *Telluride Journal* states that

the output of the county has been more than half a million dollars, which is a remarkably good showing, when it is considered that almost no work was done upon the mines until in July, and that the output is the result of a little more than four months' active work. There is no question but what many properties have been put in shape the past season for extensive working and a large production during the present year, and we confidently predict, that should no unfriendly legislation be had upon the silver question this winter, San Miguel's output for 1885 will reach a million dollars, nearly half of which will come from the Smuggler, Sheridan, Cimarron and Mendota claims, in Marshall basin. The following is a partial list of the producing mines in San Miguel county, with the number of tons of ore produced by them, which has either been shipped, concentrated or otherwise treated. This list is subject to additions and corrections, as more accurate information is obtained. The value of the ore and bullion is about $675,000. This does not include $15,000 worth of ore concentrated and shipped from the San Miguel mill early last spring: Cimarron, 920 tons; Pandora, 2,200; Sheridan; 1,500; Nellie, 500; Smuggler, 500; Boomerang, 75; Alta, 20; Mendota, 100; Gold King, 1,500; Cincinnati, 73; Flora, 15; Silver Chief, 50; Silver Glade, 30.

List of mines in Iron Springs districts, San Miguel county, having produced ore during 1884: Nevada, 298 tons; Caribou, 235; Silver Bell, 90; Butler, 75, Parsons, 10; Fulton, 20; Spar, 10; Grand View, 60; Valley View, 22; Acme, 10; Sulphurettes, 50; Golden Eagle, 25; Osccola, 250; Santa Cruz, 15; Suffolk, 105; Geneva, 20; Cleveland, 5; Summit, 250; Statsburg, 20.

IDAHO.

It is a matter of surprise that Idabo should have shown such a falling off in bullion product for the year 1884, as compared with the previous year. In fact, the Territory shows the largest reduction of any of the bullion-producing regions with the exception of Colorado. This is the more surprising, as within the past year a great deal of attention has been paid to Idabo mines, and it was expected that the developments being made in many of the camps would increase the bullion yield materially. Estimates, however, have been exaggerated, as the summing up of the year's work proves, and only about three and a half millions of dollars appears to have been produced, according to accepted figures. It may be mentioned, however, that one county alone—Alturas—claims to have yielded $4,000,000, or about half a million more than Wells, Fargo & Co. attribute to the whole Territory.

Of this county, the Wood River *Times* says: The ore and bullion shipping business of this county is getting so systematized and concentrated that it would seem very easy to obtain accurate statistics, yet such is not the case: the samplers and smelters, being owned by individuals or operated by agents, these do not always feel at liberty to supply the desired information, because their patrons might not care to have their production known. Yet it is possible, by drawing upon various unofficial sources of information, to arrive at a fair estimate of the yield.

The Vienna Company, for instance, has produced steadily during the past year, at the rate of one and a half bars of fine bullion, worth about $1,500 each. This would be some $2,250 per day, but the mill having been idle occasionally, from various causes, its total production of bullion for the year may be placed at not more than $750,000.

The Atlanta and Rocky Bar bullion does not seek a railway via Wood River, as it has a nearer shipping point at Mountain Home. The yield of the two camps mentioned, the past year, is, however, stated to have been nearly $500,000.

The Ketchum works shipped bullion and ore valued at about $350,000. This company had a very brief campaign, and the management did a "safe" business—that is, it made the business self-supporting—something unknown heretofore in the history of smelting on Wood River. While pursuing this conservative policy, its working facilities were increased, so that this year its output will be much greater than the last.

Bellevue and Broadford, the past year made quite a record as an ore-producing point. The Minnie Moore having changed hands, early in the year, her ores were extracted and marketed, and some $450,000 thus reclaimed from the vein where it had lain buried. The Queen of the Hills mine also became an ore-producer, and yielded about $150,000. The yield of the mines of Bellevue, Broadford and immediate vicinity for the year may be safely put down at $740,000,

Hailey still remains the shipping point for the mines of Bullion, Deer Creek, and intermediate points, most of the ore from which is sampled at the Hailey Sampling Works; yet, some ore was shipped without being sampled here. The total shipment from this point the past year will undoubtedly aggregate $1,500,000.

Muldoon did not make much of a showing this year. The owners of the smelting furnaces there are the same as are interested in the Ketchum furnaces, and having determined to make their operations in this country self-sustaining, they concluded to keep the Muldoon works closed for the year. Sometime during the summer, however, Colonel Ballentine and Fulton Haight succeeded in obtaining a lease of the company's property, and the output of the camp since probably amounts to about $75,000; while the yield of the Snake river placers will doubtless be at least $25,000.

The total output of the mines of Alturas county for the year 1884 may therefore be safely stated at $4,000,000.

The past year has been one of experiment and building. Smelting furnaces have been constructed in one place and "shut down" in others; several hoisting and concentrating works have been constructed, roasting furnaces built, and new mines discovered. But most of this was not ready for use until too late to make much of a showing this year. Next year, however, all this machinery will be available, and the output of Alturas county will (if Congress does not compel the shutting down of our mines) be fully seven million dollars ($7,000,000)!

The journal quoted, in speaking of the Wood River region, adds: From the first settlement of the Wood River region, the yield of our mines, notwithstanding the many disadvantages under which we have labored, has steadily increased. The first locations, after the Indians were driven out, were made in 1880; that year but a few tons of ore were shipped to Salt Lake: in 1881—the following year—the Wood River mines yielded $1,250,000; in 1882 the yield doubled; in 1883 it was $3,500,000, and in 1884 about $4,000,000. The total yield for the past four years foots up about $11,000,000.

Cœur d'Alene mines, in this territory, have proved failures as far as any wonderful riches are concerned. The mines on the famous Pritchard creek are placer, the bed rock being so deep where pay is found that much expense is incurred in opening the claims, thereby making it impossible for men without means to work them. Many of these are probably rich, and when worked, will no doubt pay well. Several good claims have been found on Trail Gulch and Potosi.

Trail Gulch is about five miles long with many side gulches, the richest yet prospected being Potosi. Potosi is some five miles long with many side gulches, which proves, when thoroughly prospected, to pay largely. Trail Gulch empties into Beaver creek, which is probably 20 miles long and a tributary of the north fork of the Cœur d'Alene river. Beaver, a mining town, is situated at the junction of Trail Gulch and Beaver creek. Beaver creek above Trail Gulch, as far as prospected, shows well. At Carbonate Center, seven miles from Trail Gulch on the Beaver, some 100 lodes have been located, which are said to be rich in silver and galena. A claim just below Trail Gulch which has only been partially prospected proves rich, the gold being coarse, one nugget weighing $42 having been found. From this claim to the mouth of the creek the ground where prospected shows fine prospects.

There are many gulches in this mining district which have never been prospected.

The Lake Creek belt of prospects is located about ten miles northeast from Ketchum and on the head of Lake and Eagle crecks. The mineral bearing belt is almost three miles in width, and appears to be the same belt which extends from Galena to East Fork of Wood River, on north side of Wood River. Three miles below the above mentioned belt, and on the east side of the lakes, is another group of mines. A good deal of prospecting is being done in both regions.

The Salmon River country, Bay Horse, Clayton, Challis, Bonanza and Custer City, the Yankee Fork country, etc., seem to be thriving and many mines are being worked. At Clayton, on Kennekinneck Creek, on the west side of Salmon, there is a 20-ton smelter, which turned out some bullion last year. The output for the season, as given in the Salt Lake *Tribune*, was 170 tons of bullion, averaging about 700 ounces silver, or a little over 120,000 ounces of silver. There was also produced seven car loads of matte, carrying 25,000 ounces of silver, making the output about $170,000. The works reduced 1,900 of ore and have 700 tons on hand. The smelter ran 60 days during the season. About 575 tons of this ore came from the Sky Lark. This ore averaged 100 ounces silver and 10 to 15 per cent copper.

According to the same authority, the Bay Horse smelter, which has one 40 and one 30-ton stack, ran nearly all last season, turning out about 80 tons of bullion per month, which went 450 ounces in silver. Besides the silver and lead bullion, some considerable copper matte and speiss was made and shipped away. The ores are "dry," having a low per cent of lead. It is proposed hereafter to use lead in the furnace, and a refinery has been added, so that soon the silver product will go out in the form of bars. The company own the Ramsborn, Post Boy, Utah Boy and River View. Near the smelter and Bay Horse very little prospecting has been done during the last six months. There are about 500 people in Bay Horse district.

During the past year the mines in the Yankee Fork country have not produced as largely as during the year 1883, but more dead work has been done, and the new strikes lately made give promise of a revival of mining matters here. The Custer mill has been running steadily, its 30 stamps turning out about $45,000 per month during the year. The ore crushed belonging to the company averaged from 35 to 40 ounces, with some little gold. This ore came from the Gen. Custer, Unknown, Summit and Badger, the latter lately leased. Of the ore worked 160 tons came from the Montana, and 300 from the Badger. The company employ about the mines and mills from 30 to 35 men. Salt costs the mill $70 per ton, and is used at the rate of six per cent of ore. The mill does excellent work and is a model silver mill.

The Charles Dickens has lain idle for several months. The Montana shipped ore which netted $26,139 at the Custer mill. The Whale, owned by Gallatien Bros. and James Hooper has been worked on a lease.

John G. Morrison, owner of the chief placer claim on Jordan Creek, has claimed that the source of the gold nuggets found on his ground must be near, and after washing the surface on part of the Washington, he sank and struck very rich gold quartz. This is believed to be one of the most important strikes ever made. The Washington lies west of the Charles Dickens, and is on the same ledge.

Other claims about Bonanza and Custer mostly lie idle for want of capital. There are many good claims which in time are destined to be heard from favorably.

Cariboo district is 30 miles from Soda Springs. Placers were found there years ago and are not yet worked out, and considerable work has been done on some few quartz claims, of which there are some 15 in the district.

Mineral district is some 25 miles north of Weiser City, and is making regular bullion shipments. The Seven Devil country is 75 miles north of Weiser City. It is expected that the placer ground there will cause a rush next spring. The Alaska copper mine has a large ledge, and there are several other large copper claims there. There is no smelter as yet.

There are some promising mines both in Spring Mountain and Texas Districts. The smelter has not been run for some time, however, for lack of ore.

The Lost river region, which we have frequently mentioned in the PRESS, is quite prosperous and many mines are being opened.

Houston is a new mineral region. The townsite of Houston is situated 95 miles from the nearest railroad station, Blackfoot, and 65 miles from Challis, the county seat of Custer county. Where, only three months ago, there was little besides a sage brush plain, may now be seen a thriving, busy town with several blocks of substantially constructed business houses and a number of streets, level as a floor, bordering which are fine residences. The Houston *Press* says: Within a circle, whose radius is 10 miles, with Houston the center, are more than 300 mines and prospects, which have been brought before the mining world during the present year. Mining here, as considered by "old timers," is but in its infancy, nevertheless, sufficient development has been made on some prospects to warrant the assertion that we have first-class mines, which will be as continuous in their yield as many of the properties both east and west of the great coast ranges.

The returns from ores extracted, in silver, copper and lead, vary in value from low to very high grade, while the deposits are immense and show no signs—even at the greatest depth yet attained—of the least diminution in highth or breadth.

On the 3d of October a 30-ton, water-jacket smelter was unloaded on a site which had been selected on the Big Copper claim, and a short time afterward it was blown in on copper ore from the Big Copper. The run was a success in every particular. The first 13 tons of bullion shipped East returned a profit of from $200 to $250 per ton. The smelter is so situated that ore can be taken from the mine, and, by means of a chute, dumped in any part of the smelter. This will be a great saving over transportation by wagon. The building put up as a shelter for the furnace and machinery was constructed with a view of accommodations for two more smelters and we are assured that two more will be put in early in the spring, thus making four smelters near Houston, for 1885.

The Philadelphia smelters in the Wood River country have four stacks with an aggregate capacity of 100 tons of ore per day, five verberatory furnaces for roasting ore, etc. They are fully equipped in every way.

A large amount of Idaho ore is shipped to Salt Lake and Omaha for reduction, so that it is really very difficult to arrive with any degree of exactness at the complete figures of production. Idaho has now a very good start. Capital has been attracted in her direction, some of the mines have proved remarkably rich. In a few years more no doubt her bullion product will be very largely increased. During the past year a special correspondent of the MINING AND SCIENTIFIC PRESS visited the camps of Idaho and wrote detailed descriptions of the mines and works. Those letters were no doubt scanned by our readers, so there is no necessity at this time of going into more details.

MONTANA.

Montana Territory, so long known for its gold mines, has come to the front as a wonderful copper producer, some of the best copper mines in the United States being within her borders. The principal camp is Butte, now famous for its many producing mines. Some of the claims made for the product, however, are greatly exaggerated, for a pamphlet issued for the New Orleans Exposition states that the "mines within three miles of Butte produced during the year 1884 more money than Arizona, Nevada or California; more than twice as much as Utah; more than Idaho and New Mexico combined, and almost as much as Colorado." This statement is absurd, as a glance at our tables of bullion production will show. In that camp, however, it is stated that the monthly pay rolls of eight of the leading companies aggregate as follows: Anaconda, $150,000; Lexington, $50,000; Parrot, $40,000; Colorado, $35,000; Moulton, $30,000; Alice, $50,000; Montana, $55,000; Silver Bow, Bell and Dexter, $60,000; Miscellaneous, $150,000; or a total of $620,000.

About 40 cars, containing 400 tons of copper ore and matte, daily leave the Butte depot destined either for Baltimore or Liverpool and Swansea. The five concentrators and smelters of Butte daily treat ore as follows: Anaconda, 500 tons; Parrott, 300; Colusa, 300; Colorado, 75; Clark's Colusa, 150; Bell, 50; or an aggregate of 1,375 tons. Copper mines not connected with reduction works produce ore daily, as follows: Liquidator, 100 tons; Mountain View, 50: Ramsdell Parrott, 25; and other mines (estimated) 75, or a total of 250 tons. The silver mills are treating ore daily as follows: Alice, 90 tons;

Lexington, 50; Moulton, 40; Silver Bow, 30; Dexter 30; Old Lexington 10; making a grand total of ore handled daily in Butte of 1,875 tons.

From a summary in the Butte *Miner* we compils the following statement of production of Butte mines in 1884:

From the Moulton the bullion is uniformly 750 fine, and the product for the year 1883 was $367,684 20. For the year 1884 the increase was almost 100 per cent, being not less than $600,000, according to the shipments of the first ten months. During the year 1884 three dividends have been declared, aggregating $80,000.

On the Bell during the past year but one furnace has been running, and 800 tons of ore per month has been the average quantity reduced. The output of the smelter in 1884 is estimated at $450,000, based on the product of the first ten months.

The Alice Company own the Alice and Magna Charta mines. The Alice properties are now producing an average of 2,400 tons of ore per month, carrying from thirty to forty ounces of silver per ton. The Magna Charta is 600 feet deep and produces 60 tons of ore daily. During the past four years the Company has paid in dividends $500,000, and is now paying $50,000 dividends each quarter.

The Montana Co. own the Colusa, which is turning out 125 tons of ore a day. On Clark's, Colusa, the output is 150 tons a day. With the exceptions of the Anaconda, the Parrot is the most extensive copper and smelting enterprise in the West. The output of the mine, which is 300 tons daily, will be soon increased to 400 tons. In the month of September, 1884, before the new concentrator and blast were started, the matte output was 1,418,975 pounds, containing 885,957 pounds of pure copper. The total matte output for the year was 14,856,323 pounds, containing 9,324,805 pounds of pure copper, the value of which, adding the silver contents, was about $1,220,000.

The Mountain View has 15,000 tons of ore on the dump. The Lexington runs at about 1,850 tons per month. The Orphan Girl, during 1884, supplied the 15-stamp Dexter mill with 30 tons of free ore daily. During the last months of the year, the bullion product was $249,000, of which $165,000 was clear profit.

A dozen men have made themselves rich out of the Gagnon. It is one of the oldest mines in the camp, and has produced since 1876, over 100,000 tons of ore, its present product being 40 tons per day.

During 1884 fully 3,000 tons of $35 ore has been extracted from the Poser mine, which embraces a section of famous Rainbow lode. For 1884 the daily product of the liquidation has averaged 100 tons of copper ore, the first-class assaying from 30 to 40 per cent, and the second-class 20 to 25 per cent, and these grades have either been shipped or smelted under contract, while the low grade ore has been allowed to accumulate on the dump until fully 20,000 tons are on hand, averaging 15 per cent, valued at $100,000. A great many other mines have produced, but space forbids mention of them all.

From the Anaconda mine, Montana's biggest copper property, during the first part of 1883, shipments of ore aggregating about 25,000 tons were made, having a value of about 45 per cent copper. Since the completion of the smelter at Anaconda, however, shipments to the east have ceased, and the product is shipped to the company's works down the valley. The new works, completed during the past year, have a capacity for treating about 500 tons daily. The plant cost over $100,000.

The *Inter-Mountain*, which gave a very complete review of the mining industries of Montana this month, in speaking of the Parrott says: The Parrott smelting works ranks as one of the most complete copper reduction plants on the continent. The vast buildings contain 6 reverberatory furnaces, 12 caleiners, and concentrating machinery, capable of dressing 300 tons of ore daily. Outside are also a number of open air roasting birs.

A very conservative estimate of the product of 1884 places the total at something over 9,000,000 pounds.

The low price of copper has naturally affected the interests of Butte, and it is probable that some of the smelters will have to close down until the price of copper is higher.

In Gallatin county there are many mines being worked. There is a 40-ton smelter in New World district, and mills in other places.

The Boulder mining region is extensive, but comparatively undeveloped.

The "East Side" mines, that is the mining districts east of the Rocky Mountains in Montana (with reference to extent and not to the bullion product) are the Ten Mile (or Red Mountain), 15 miles southwest of Helena; the Clark's Fork district, in the southeastern part of Gallatin county, and the Neihart, Maiden and Barker districts in Meagher county. Custom concentrating works of 50 tons a day capacity have been put up in Ten Mile district. There is a matte in Barker district, but it is not running. In Maidon district, the Montana mine is yielding $25,000 a month with a 20-stamp mill.

With the exception of the Montana mine at Maiden, the producing mines of the east side are situated tributary to Helena, and outside of the limits of any of the districts mentioned above. They are the Helena Mining & Reduction company's mines at Wickes; the Drum Lummon at Marysville; the Gloster, 20 miles northwest of Helena; the Gregory 20 miles southwest of Helena, and the Elkhorn, 35 miles southeast of Helena.

At Wickes the Helena M. & Reduction Co. has property paying $36,000 a month in dividends. Drum Lummon is producing at about the rate of $2,000,000 per year. The Globe yields about $500,000 each year. The Elkhorn pays about $5,000 a month dividends. The *Inter Mountain* says:

The leading quartz mines of Deer Lodge county (the county is also somewhat noted for its placer mines) are the Cable, Algonquin, Hope, Granite Mountain and Princeton. The first of them, the Cable, has produced some of the richest gold rock known, and it has already added several million dollars to the gold wealth of the world.

For several years past the Phillipsburg silver mines—principal among which are the Algonquin, Spreckled Trout, Hope, Comanche, Granite Mountain, Pyrenees, and other properties—have been rolling out a steady stream of wealth. The output of the Granite Mountain alone is now some $300,000 per year. The Hope Company is paying regular dividends. They aggregate to date about $170,000. Its output the past year has been about $100,000. All the properties mentioned are being worked successfully and with profit.

Silver lodes also abound in Moose Creek district, and valuable gold-bearing lodes in Highland, Snowshoe, McClellan, and Bear gulches.

In Southern Montana the Hecla produced about $1,000,000 in 1884. In Blue Wing, Argenta, Birch Creek districts are many paying mines.

Mining is the great industry of Madison county, its principal minerals being gold, silver, lead, copper, iron and coal. It has quartz lodes in nearly every portion of it, there being between 5,000 and 6,000 mine locations on record. Gold is its leading mineral. With the decline of the placer mining interest, quartz mining has come to the front. Among its leading quartz (gold) mining districts are the Silver Star, Red Bluff, Wisconsin creek, Meadow creek, Sheridan, Iron Rod, Hot Springs, Alder and Summit.

The silver mines are principally in the Potosi district, forty miles north of Virginia City, where some twenty-five mines show rich prospects, the ore, it is stated, assaying in some cases from 100 to 30,000 ounces silver to the ton. There are also some copper prospects in the county, coal discoveries, and large deposits of iron.

The gold and silver received at the Helena assay office for the year was as follows for each quarter:

1	$104,179.72
2	123,434.11
3	364,758.28
4	310,645.41
Total	$903,017.52

The Alice, Original, Lexington and Moulton are the dividend payers of Butte; and elsewhere in Montana the following are paying dividends: Boston, Montana, (near Helena); Hecla, (at Glendale); Hope, (at Phillipsburg) and Elkhorn, (Jefferson county).

NEVADA.

For many years Nevada headed the roll of bullion producers, but the palmy days of the immense production of the wonderful Comstock have passed, and the bullion yield has gradually fallen off. In 1883 Nevada took fourth place. In 1884 she takes fourth place on the list, but shows a gain over 1883 of $110,318—a small amount to be sure, but still a gain. A product of nearly nine millions from what some people call a played-out mining region is pretty good, especially as it is far ahead of some regions supposed to be exceedingly properous from a mining point of view. Storey county, where the Comstock is located, shows the following bullion product for 1884:

VIRGINIA MINING DISTRICT.

Andes	$1,722.00
Ophir	81,841.77
Potosi	200,000.00
Savage	13,058.00
Union Consolidated	5,065.13
Gould and Curry	19,206.18
Hale and Norcross	102,712.02
Mariposa Mill	21,890.30

GOLD HILL DISTRICT.

Belcher	380,243.73
Crown Point	539,522.73
Kentuck	370,364.37
Yellow Jacket	650,915.00

THE CANYON MINES.

Monte Cristo	23,350.34
Lady Bryan	9,934.50
Total	$2,432,884.58

The most notable event in the history of the Comstock last year was the abandonment of the lowest levels after long and patient prospecting under adverse circumstances. Nothing was found to warrant a continuance of these prospecting operations, and the machinery, etc., was removed, so that the lower levels were allowed to fill up. They are now prospecting at points less deep, and looking for ore bodies they may have passed in the race for depth. Some of the miners are even prospecting only a few hundred feet deep, searching out small lots of ore that in former days would not pay to work. Vigorous prospecting is going on in all directions.

The bullion product of the Comstock was, as stated in the preceding table, $2,432,884.58 for 1884. The assessments levied on the Comstock mines in the same time aggregated $2,930,85, so the mining was done at a loss. To show the expense attending the mining operations on the lode, the pay-roll of some of the mines in December last is given:

Utah	$2,400.00
Sierra Nevada	2,650.75
Union Consolidated	4,325.00
Mexican	2,021.00
Ophir	8,008.50
Con. California and Virginia	7,162.50
Union Shaft	7,562.25
Savage	1,174.00
Hale and Norcross	5,326.00
Crown Point	12,777.00
Belcher	10,580.00
Combination Shaft	18,265.00
Total	$82,551.00

On the 1st of January, 1885, the various Comstock companies stood financially as follows:

CASH ON HAND.

Alpha Con	$4,781.42
Best and Belcher	34,538.14
Belcher	15,094.13
Challar	34,541.10
Crown Point	21,367.45
Exchequer	1,008.82
Gould and Curry	43,035.05
Mexican	11,803.98
Ophir	7,883.47
Occidental	2,892.88
Sierra Nevada	27,494.95
Savage	16,878.58

INDEBTEDNESS.

Hale and Norcross	37,351.66
Potosi (overdraft at bank)	2,107

The Surveyor General of the State, General Preble, in his report says: Any section of European country that had produced $180,000,000 of silver and $145,000,000, of gold in 20 years, as the Comstock has, and disbursed as dividends $120,000,000, besides disbursing $4,000,000 annually in wages, would be fostered and encouraged in its production by the General Government, and would be looked upon as a mainstay to the financial market of the world. The Government, however, seems to regard the matter as of no consequence. Outside the Comstock, nearly $100,000,000 more have been produced in the State, adding to the tangible wealth of the world over $425,000,000 in silver and gold. This is from assessors' reports; true reports would show nearer $600,000,000, as a vast amount has been produced of which no reports were ever made. Instead of building up the State and benefiting it, the wealth produced has been used to retard its progress. It has been taken away to beautify other countries, to astonish foreign courts by the garnish grandeur, vulgarity, and lack of interest of its possessors. It has laid foreign cables and built up papers that to-day decry it to the world as a tax-ridden, poverty-stricken monstrosity that even the crows and scorpions are emigrating from. It has retarded legislation to encourage farming, grazing or any other interests of permanency. It has centered itself within itself, taken wings and left us with hundreds of miles of holes in the ground to be filled with water or to be utilized as best we may, and still we survive. We not only survive, but we flourish. The State produced $7,000,000 of gold and silver in 1884 and sold 85,000 acres of land in the face of all opposition from the outside. Property is not taxed high in most of the counties of the State. The rate may be high, but, with the exception of Storey county, the valuation is low.

There are many facts, however, which indicate a renewal of interest in the mining industry of the State. The *Silver State* thus summarizes them: For several years past the population of our State has been steadily decreasing, a loss that is mainly attributable to the gradual decline of our mining industry. The decline along the Comstock had its reflection, and every mining district in the State, no matter how promising its prospects, was affected in a corresponding degree. The effect then produced has never been overcome, a fact which has given birth to the idea that Nevada mining properties are worked out, and that another season of prosperity will never come through the medium of the mines. The development that is constantly going on, and the discoveries that have followed have demonstrated most conclusively that this impression is groundless, and that proper encouragement, and the removal of certain contingencies under which the mining fraternity labor, will build up our now lagging industry, and activity and consequent prosperity will come again. Numerous instances can be cited corroborative of the fact that practically abandoned mining camps have been brought back to life by energy and perseverance, and are to-day heavy bullion producers. Tuscarora is a fair representation of this class of mining camps. A few years ago it was generally considered "worked out," but subsequent development has established the fact that its future may be even more prosperous than its past. It is unnecessary, however, to cite instances so far from home. Those who are familiar with the mining history of this county can recall parallel instances that have taken place in this immediate neighborhood. Two years ago the Paradise mine was practically abandoned—in fact, was considered worthless by former operators—but energy and mining ability have had their effect, and to-day it is one of the most promising mines in the State. Other properties in the same neighborhood only require the same determined energy and requisite capital to bring them out. Willow Creek district has had its struggle, but capital has at last become interested in its development, and the result that has followed has been of the most encouraging character. This district certainly offers as fine inducements as a mining man can desire. Among the numerous locations that have been made in this mineral belt, quite a number only require capital to make them paying propositions. Instead of worked out mining districts, the fact of the matter is that Nevada has just as fine mining opportunities as it ever had. Honest representations will have their effect, and though it will take time to accomplish the end, the day will come when our promising but now idle enterprises will receive the attention they justly deserve.

In other portions of this review will be found the statistics of assessments and dividends from Nevada mines for the year 1883. The assessments foot up $3,631,350, and the dividends, only $193,500. These are from incorporated companies. No doubt, however, as in other places, many mines have paid a profit, of which no public record has been made.

Eureka district has suffered somewhat from the low price of lead, yet the yield of its principal mines has been large. During the year 1884 the Richmond Mining Company, of Eureka district, shipped through Wells, Fargo & Co., bars of precious metal containing $357,884.92 in gold, and $595,914.01 in silver. Owing to the depreciated value of lead, only 1,829 tons were shipped by the company. During the same period the Eureka Consolidated Company shipped gold and silver in 1,363 tons of lead, to the value of $466,722.20.

Extensive improvements are being made at Eureka, by the Eureka Consolidated Co. The old smelters are being torn down, and a new one constructed, so as to give the company more dumping space. This will allow them to reduce their ores more systematically, and at a reduced cost. The improvements will not only be of benefit to the company, but to the people

of the camp at large, and particularly to the owners of small mines, who will have competition in the sale of their ores. The Eureka Con. Co. will receive custom ores during the time that the improvements are going on, and will have large quantities on hand when they are ready for smelting, which will be in about six weeks. The new smelter is to he located on the side of the hil, that others can be readily and conveniently added to it as the requirements of the company may demand.

From Eastern Nevada, during the year 1884, the Geddes and Bertrand Mining Company shipped through Wells, Fargo & Co., 38 hars of hullion, weighing 2,849 pounds, and valued at $40,250. During the same period the Tyho Company shipped 9 hars, weighing 1,130 pounds, and valued at $13,100. Miscellaneous shipments to the value of $16,338.52 were also made.

The Pioche *Record* states that the Bullionville Smelting Company, at present engaged in leaching the residue tailings, of which they own some 300,000 tons, have, in this, their first lixiviation test hy the Russell process, scored a grand succcss; a success that places the enterprise beyond the realm of the experimental, to that of a sound and paying hasis.

The districts along the Carson and Colorado railroad are heing slowly developed, but no very important changes have heen made in the year.

Nevada produces considerahle salt, some sulphur and various other mineral products, no account of which is taken in her figures of mineral yield.

NEW MEXICO.

The bullion production of New Mexico in 1884, was $3,660,614, a gain of $247,095 over the previous year. In some localities in the Territory there have heen gains, in others losses, hut the aggregate shows the gain mentioned. The general dullness prevailing has affected the mines of New Mexico as it has other regions. Market values of lead and copper have been low. Until within the last twelve months mines were numerously worked for their joint prodnct of lead and silver or copper and gold that are now or have for months heen idle hecause of the prevalent low figures for baser metals. The stoppage of these and the overproduction of lead and copper, notwithstanding has been the chief cause of the mining depression that has shown itself so generally and which has kept from the districts and camps of the country the capital that is wont to look for iuvestment therein. The Silver City *Enterprise* says:

There are few who will dispute the assertion that in Grant county the past year has been one of real progress. The figures show this. They show that we are not arguiug from false premises when we state that the county is in a hetter mining condition to-day than has ever been the case heretofore. There are more mines producing gold and silver in operation now than there were a year ago, and in a year from the present time the numher will be materially increased. The falling off in the total of the county is due to two cases: First, the cutting off of Kingston by the creation of the new county of Sierra, and second, the suspension of operations at Santa Rita, San Jose and Ivanhoe. The prodnct of the latter camps has heon chiefly copper and a species of silver-lead ore, which, through the cause mentioned, in a preceding paragraph it has not been profitable to mine.

The gold and silver properties of the county show a decided gain upon the whole. Most of the regular producers lahored under severe disadvantages during the greater portion of the year. This was notably the case with the Bremen mine and the Georgetown properties, while several of the best camps in the southern portion of the county showed hut little activity during the year. The mines at Gold Gulch and Gold Hill have accomplished a great deal in the way of taking out ore, but only a small quantity has been shipped away. The totals which we give are prepared from figures furnished us by the owners and superintendents of properties, and are in almost every instance absolutely correct. There has been a disinclination on the part of many to have their mines particularized, in consequence of which there is an absence of detail that might otherwise prove interesting.

As was the case in 1883, the camps whose busiuess is directly tributary to Silver City, and which fairly entitles them to be termed

Silver City Mines

Are in the lead. They comprise the Bremen and otber Chloride Flat mines, the mines at Fleming, Bullard's Peak, Pinos Altos, Telegraph and those at Bald, Bear and Lone mountains. To the total of the product of these has also heen added the bullion hougbt hy the hanks of this city. The yield for the year aggregates the snm of $376,836.29. Of that amount the Bremen mine produced $125,528.16 and the Old Man mine $94,430.13, the balance being distrihuted among the others mentioned. The Bremen mine, as is well known, has heen operated to a limited extent only, while the mill has heen running scarcely more than half the time. The Old Man yield is the result of work from the 2d of June to the first of the year, a period of only seven months. It is estimatcd that there is on the dumps of the Old Man ahout 15,000 tons of ore valued at $20 per tou, a total of $300,000. This will be treated at the mill which the company intends putting up. When it is considered that our two leading mines were active for but little more than half the time, it will he seen that there is no cause to anticipate a decrease in the future annual outputs of the mines here.

Georgetown Mines

have made a very appreciahle increase during the year. The close of 1883 witnessed a very discouraging state of affairs there, and it looaed at one time as though tbere would he a very great falling off in the silver yield. The resumption of work upon the Mimbres mining company's property, together with the excellent showing made hy the Commercial mine during the year, rehabilitated the camp upon its former prosperous hasis. The total value of the ore produced, was $288,627. The average value of the ore shipped from the Commercial mine to Socorro during the year was $245 per ton. Of the total accredited the Georgetown, the Mimbres company produced $161,000. The company handled 18,000 tons of ore since the 1st of July, at which time Mr. Pheby took charge.

The Southern Camps

which comprise Carlisle, Victorio, Eureka, Pyramid, Shakspeare, Gold Gulch, Gold Hill, Tres Hermanas and Floridas, show an increase over 1883. This is in spite of the fact that in several instauces there has heen almost nothing done. The total for the camps mentioned amounts to $529,000. The outlook for the mines in this portion of the county is very flattering, and tbe recent discoveries at Gold Gulch and Gold Hill must certainly augment during the coming month the aggregate yield.

Cook's Peak

has shipped 126 tons of ore, the value of which was $5,100.

Santa Rita

figures last year as a producer of iron ore which is used for fluxiug purposes by the Benson smelter. Five thousand tons, valued at $5 per tou on the dump, it amouuted to $25,000.

Recapitulation.

Silver City mines	$376,863 29
Southern camps	529,606 00
Georgetown	288,657 00
Cook's Peak	5,100 00
Santa Rita (iron ore)	25,000 00
Total	$1,224,560 29

As compared with the yield of 1883, there is a difference in favor of that year of $307,863.90. Kingston has in all likelihood more than produced the difference, so that instead of there being a falling off, as is apparent at first glance, the county has in reality made a small gain. One of the important factors in the make-up of the estimate for 1883 was the aggregate yield of Santa Rita, San Jose and Ivanhoe, which amounted in all, to $150,298.11. In the year just passed, they accomplished nothing in the way of ore shipment, save the iron noted. It will he seen, therefore, that the gold and silver yield of the county is on the increase, and that that fact is one which argues greatly in favor of the county's future as a producer of the precious metals.

UTAH.

While Utah heads the list of all the States and Territories as far as mining dividends are concerned, it scores numher five in the roll in considering the aggregate product for the year. Lead plays a conspicuous part in her total product. This metal has seen so low a price of late that it materially reduces the net value of the product of the Territory. Indeed, some of the smelters will probably close down for a time unless the price of lead improves. There are many districts and mines in Utah, and we can in this issue give only a cursory glance at the more prominent ones, want of space preventing any extended mention such as the mines really warrant. The Salt Lake *Tribune*, in its annual edition, gave very exhaustive accounts of the districts and mines, presenting very full reports from most of them. We compile from that source what information we are ahle to present to our readers.

The tahles of hullion production of Utah, which are printed on page 54 of this numher of the PRESS, shows a marked annual increase in the percentage of gold and silver produced in the manufacture of hase bullion. It demonstrates conclusively that the process of smelting is in the ascendant for the reduction of ores, and that any causes tending to decrease or discourage smelting operations in the Territory, will produce a corresponding decrease iu the gold and silver production west of the Missouri river.

Our table of total hullion output for twelve months, exclusive of ore, figures up as follows:

January	$449,228.74
February	364,606.47
March	469,366.66
April	432,809.44
May	343,416.16
June	539,532.90
July	530,978.35
August	526,393.33
September	522,283.49
October	532,886.61
November	545,018.88
December	609,511.26
Total	$5,856,532.64

The actual output, as given hy Mr. Dooly with approximate exactness, was $7,389,836.90, or at seahoard valuation $9,301,508. The difference hetweeu the two is mainly made up hy operations which make no reports save at the end of the year.

The Horn silver mine, which has paid out $4,000,000 in dividends, has hoisted 210,000 tons of $50 ore from a chimney 800 feet deep. Since February, 1876, it has put out 192,652 tons of ore, which produced 120,282,970 lbs. of lead, and 6,552,992 ounces of silver. Previous to that time, Campbell, Cullen & Co., and the Frisco Smelting Company, had smelted 16,299 tons, easily good for 13,462,000 lbs. lead, and 807,453 ounces silver, net. A total of 209,251 tons of ore, yielding 133,744,970 lbs. lead, and 7,360,445 ounces silver, net. Rating lead at two cents a pound in Salt Lake, and silver at $1.08,1879-1884, worth $10,624,179; per ton, $50.77. The output of the company's smelters, rising 6,000 tons of base hullion, sold the lead in Chicago, the silver in New York, for $9,561,336.81. That of 1884 will make it about $12,000,000. Cost of mining, smeltiug, refining, and transportatiou East, must, of course, come out of this. Cost of refining in Chicago is about $8 a ton.

Shipments of orc to the smelter have lately heen reduced, on account of the decline in gold and silver, and there is talk of shutting down for some months.

The most important mine heing worked at Big Cottonwood district now is the Maxfield, which is shipping ore, though the grade has been low.

The Stormont mines, at Silver Reef—the Sandstone district—from July, 1879, to Nov. 3, 1884, yielded 74,300 tons of ore, which produced 1,404,976 ounces fine silver, averaging 18.9 ounces per ton; dividends, $145,000.

At Tintic the Eureka yielded last year 16,000 tons of $20 ore. The Beck Bullion and Champion yielded together 6,800 tons. The Northern Spy shipped 700 tons; Mammo.h Copperopolis, 800 tons; other mines, 327 tons.

At the Oneida placers a ditch is heing put in, and when the water is in they expect to clean up a million a year.

The Christy M. & M. Co. at Silver Reef comprises 23 claims. The Christy commenced developing and working the property January 1, 1878. The total gross hullion propuct was

For 1878	$302,536 81
" 1879	240,466 37
" 1886	272,084 45
" 1881	316,039 46
" 1882	372,436 10
" 1883	262,310 60
" 1884 (10 days)	5,276 76
900 bars valued at	$1,776,134 64

Active operations were suspended hy the Christy Mill and Mining Company in January, 1884, on account of the high rate of wages and cost of supplies. Both have since heen materially reduced, correspondingly reducing the expense of operating the mine and mill.

The Calumet and Hecla group at Stockton has very low grade ores, and they are concentrating them.

The Brokolyn, the great lead barhonate mine at Bingham, is shipping 600 tons of first-class ore and 100 tons of concentrates a month.

The lead mine in Bingham is turning out 10 tons of 50 per cent lead ore per day, and 70 tons of 18 per cent orc. The smelting works produced in 1884, 6,480 tons of hullion, carrying 110 ounces silver and 320 ounces gold per ton.

The output of the Yosemite mine for 1884, 1,900 to 2,000 tons of ore.

The old Telegraph, at Bingham, yielded (under lease) 5,553,860 pounds of ore. The Nast shipped 1,056,220 pounds; and the Saturn, 306,720 pounds. Other mines aggregated shipments of 2,225 tons. From this district the total shipments were ahout 25,000 tons.

The Crescent mine, at Park City, is a paying mine. The following comparative statement of ores sold from the Crescent mine in 1883 and 1884, receipts on account of, dishursements, cost and profit per ton, etc., is from repor s made to the stockholders hy officers of the company, to wit:

	1883.	1884.
Tons of ore sold	11 574	12,748
Received for same	$346,148.49	$145,664. 2
Received per ton	29.92	11.27
Total cost of	$193,908 95	$162,545.39
Cost per ton	16.77	12.75
Total profits on	$152,239.54	$83,120.63
Profit per ton	13.15	6.52

The value was $3 per ton less in 1884 hecause of the lower price of lead. There was still a reduction in grade, however, perhaps due in part to less careful selection, of $7.65 per ton, or ahout 25 per cent. More than half of this loss was made up hy

The Ontario (Utah) "hoss" mine has dishursed some $6,000,000 in dividends in eight years. There were sold and treated in 1884, 24,872 tons of dry ore, which realized $2,060,241.96. From the organization of the Ontario S. M. Company, and the starting of their mill February 1, 1877, to Decemher 31, 1884 (part of Decemher estimated), 137,316 tons of dry ore have heen reduced and sold, the product of which sold for $13,539,981.69. Prior to that the Ontario M. Company had realized $1,014,596.96, representing, assuming that the ore graded the same as all the ore since, 10,290 tons of dry ore. The total output of the mine to date is therefore 147,606 tons of dry ore, realizing to the company $14,554,578 65—$98.60 per ton. The mine paid its 102d dividend of 50 cents per share—64 on 100,000, 38 on 150,000 shares—in all $6,050,000, December 31, 1884; $51 per share on the old shares, $19 on the new shares.

The mines mentioned comprise the principal bullion producing properties in Utah, but there are thousands of others heing developed. Utah produces also iron, coal, and many other minerals. Her future possihilities are great Salt Lake has become a great ore market, and receives much ore from Idaho. That Territory and Montana are in a degree tributary to Salt Lake. We regret that space forhids our giving more space to a description of the mines, reduction works, etc., in Utah.

WASHINGTON AND OREGON.

As producers of precious metals, neither Oregon nor Washington cut much figure, as compared with the other regions. Therc are many placer mines in Oregon, however, which are paying very well. The quartz mines are being worked also, but no very remarkable ones have heen opened. Oregon has many coal mines which are productive, and one nickel minc not yet developed, however, sufficiently to show its work.

Washington Territory has several good coal mines, which send their product to this market. The gold product of the Territory, given on our bulletin tahles, is small.

Assaying.

There will shortly he issued by Dewey & Co., puhlishers of the MINING AND SCIENTIFIC PRESS, a work on Assaying, hy C. H. Aaron. It is now in press and nearly completed. The work comprises parts 1 and 111 of the subject, part 1—"Gold and Silver Ores," having been published last year. The forthcoming volume, which contains the resume and third parts, and an appendix, is devoted to "Gold and Silver Bullion," and "Lead, Copper, Tin, Mercury, etc." Like previous volumes edited hy Mr. Aaron, the new work is eminently practical in its character and the result of personal observation and experience. It is plainly written, so that any miner, prospector, or assayer can understand it without scientific chemical knowledge. The volume is small and clearly printed, with suitable illustrations, and will be sold for $2.

BUILDERS OF..

MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

Plants for Gold and Silver Mills, embracing machinery of **latest design** and **most improved** construction. We offer our customers the **best results of 35 years' experience** in this **special line** of work, and are **prepared** to furnish from **San Francisco** or **Chicago,** the **most approved** character of **Mining and Reduction Machinery,** adapted to all grades of ores and **superior** to that of any other make, at the **lowest possible prices.**

We are also prepared to **construct** and **deliver** in **complete running order,** in any locality, **Mills, Concentration Works, Water Jacket Smelting Furnaces, Hoisting Works, Pumping Machinery, etc., etc.,** of any **desired capacity.**

WATER JACKET SMELTING FURNACES

For **Copper** and **Argentiferous lead** ores of **new** and **original designs,** covered by **letters patent.** No other Furnace **can compare** with these for **durability,** and in **capacity** for uninterrupted work. **More than 150** of them are now **running** in various parts of **this country,** as well as many in **foreign countries,** giving results **never before attained** as regards **continuous** running, **economy** of fuel, **amount** and **quality** of **bullion** produced. These **claims** have been **proven by results** in **any number of instances,** and the **great superiority** of this **system** of smelting ores **demonstrated beyond question. Complete plants** furnished to order of any **capacity,** with **all improvements** that experience has **demonstrated as valuable** in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been **thoroughly tested** for the past **two years,** under a **great variety** of **conditions,** giving most **extraordinary** results **far in advance** of anything **ever before realized.** A recent **competitive test** at the Carlisle Mine in Mexico, showed an **advantage of over 30 per cent** in favor of the **Duncan.** The amount **saved over the Frue** being sufficient to **pay the entire cost** of the machines **every month of the year.** One of its **most valuable** features is as an **amalgamator.** It saves all **the amalgam gold** and **silver** that **escapes the batteries, pans** or **settlers,** making the machine worth **more than its cost** for **this purpose alone.**

HOISTING WORKS

Of late and **improved** design with all **known appliances** for **safety** and **efficiency** to work to any depth and of any **desired capacity.** Complete **shaft equipment,** such as **safety cages, landing dogs, cars, turn-tables,** ore and **water buckets, skips,** etc., etc., for either **vertical** or **incline shafts.**

PUMPING MACHINERY

Adapted to all Requirements.

HOISTING WORKS

Improved Methods of Engraving.

The production of engravings for ordinary printing is being constantly improved, and the proprietors of this paper, having use for numerous engravings for their own publications are taking special pains to keep up with the progress of the times in all kinds of wood and photo-engraving, and zinc etchings, and now have such connections as enable them to receive orders for all kinds of engravings on the most favorable terms to their patrons, for illustrating books, catalogues, trade circulars, labels, show cards, portraits, views, fruits, vegetables, plants, animals, and scenery for newspapers. Engravings of mechanical inventions, buildings, machinery, manufactories, facsimiles of medals and coins, ancient manuscripts, paintings, drawings, sketches and autograph circulars, views and portraits from nature, medical and scientific objects, antiquities, students', architects', engineers', and surveyors' drawings, etc. Parties interested are invited to write for information desired, stating as fully as possible concerning the illustrations wanted, to this office.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & Co., Publishers,
No. 252 Market St., S. F.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Postpaid, $7.50. Printed and sold by Dewey & Co., S. F.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition, 1880), and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. A valuable and carefully written work. Postpaid, $3. Sold by Dewey & Co., S. F.

MINING, ENGINEERING, MECHANICAL, FARMING, SCIENTIFIC, INDUSTRIAL, and New Books in general, can be ordered through Dewey & Co., S. F., at publishers' rates.

Mining Dividends.

On page 54 is given a series of tables of the assessments on mines levied during 1884. The assessments aggregate $4,724,700 as against $5,885,784 in 1883. The incorporated mines in eleven States and Territories in 1884 distributed as dividends $9,185,000. There are thousands of paying mines, however, which do not appear on the list, for they are owned by private individuals who have no reason to state the product. The largest amount in dividends came from four mines in Utah, two of which—the Horn Silver and Ontario—paid out 20 per cent of the grand total. California reported more incorporated dividend-paying mines last year than any other State, and the aggregate amount of the disbursements was the next largest from all sources. The six incorporated copper mines of Michigan paid nearly as much as the twelve incorporated silver dividend mines of Colorado. The Arizona mines did poorly last year. Nearly one-third of the total from the fourteen California mines last year came from the Plymouth Consolidated of Amador county. This mine also contributed a third of the amount paid by thirteen California mines in 1883. The Small Hopes mine in Colorado paid over 60 per cent of the combined total of the twelve mines in that State. Yet the Small Hopes was entirely unknown as a dividend proposition prior to March, 1884. The dividends of the Michigan copper mines fell off one-half last year as compared with 1883. The Montana mines nearly doubled their dividends. The Nevada and New Mexico mines fell off more than one half. The Utah mines show an increase of nearly 40 per cent.

The *Bulletin* gives the following table of dividends for 1884:

ARIZONA.

	Dividends.	Amount.
Contention Consolidated	1	$62,500
California	1	8,500
Copper Queen	2	200,000
Silver King	2	50,000
United Verde	1	60,000
Vizinia	1	5,000
Totals	8	$385,000
In 1883	18	1,109,000

CALIFORNIA.

	Dividends.	Amount.
Bird's Eye Creek	2	$11,250
Bodie Consolidated	6	269,265
Bonanza King	6	150,000
Bulwer Consolidated	1	10,000
Derbec Blue Gravel	6	60,000
Idaho	12	244,900
Mt. Pleasant	1	15,000
Oro Grande	10	174,360
Quicksilver	1	128,730
Plymouth Consolidated	12	600,000
Plumas Eureka	2	123,947
Sierra Buttes	2	30,376
Standard Consolidated	3	75,000
Syndicate	6	60,000
Totals	70	$1,953,337
In 1883	48	1,009,976

COLORADO.

	Dividends.	Amount.
Adams	5	$82,500
Bassick	1	100,000
Bullion	2	10,000
California	1	32,500
Catalpa	1	30,000
Carbonate Hill	2	20,000

Honorine	1	12,500
Horn Silver	4	1,200,000
Ontario	12	900,000
Total	18	$2,137,500
In 1883	13	1,582,000

Recapitulation.

Annexed is a condensed statement of the above dividends, showing the number of mines contributing to the grand total:

	Mines.	Dividends.	Amount.
Arizona	6	8	$386,000
California	14	70	1,953,337
Colorado	12	31	1,350,000
Dakota	3	34	578,250
Michigan	6	11	1,327,500
Montana	8	37	997,912
Missouri	1	2	40,000
Nevada	5	17	193,500
New Mexico	3	3	190,000
Utah	4	18	2,137,500
Vermont	1	3	31,000
Totals	64	234	$9,184,999
Mexico	2	5	277,675
Total	64	239	$9,462,674
1883	66	238	10,130,050
1882	64	331	13,308,150
1881	60	342	13,653,400

Considering the general depression in business last year, the mining industry may be said to have held its own remarkably well.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR IMPORTED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions recorded valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be cut connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited.

To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

FLORIDA oranges are selling at one cent apiece at wholesale in Atlanta, the market being glutted with them.

The Mining Share Market.

The market has been in a declining mood this week, prices having fallen. The proposed stoppage of work below the Sutro tunnel level in the series of Comstock mines, north of the Savage, has affected the market. Still, many persons holding shares in Comstock mines are hopeful that in the old upper levels more good ore will be found, and perhaps they will strike a bonanza.

Fifteen stamps of the Standard-Bulwer mill at Bodie have started on ore from the Standard Consolidated mine, and regular shipments of bullion will follow, as a large quantity of ore has been accumulated and the mine is showing well in several places.

Bullion Shipments.

King (San Bernardino county), Jan. 16, $3,905; Alhambra, 16, $13,490; Parker (Idaho), 12, $11,000; Alice (Montana), 6, $18,680; Lexington, 6, $19,152; Old Lexington, 7, $1,584; Moulton, 7. $12,314; Dexter, 10, $18,000; Alice, 9, $22,288; Hanauer, 13, $7,600; Minnie Moore (Idaho). 13, $6.030; Ontario, 13, $17,942; Hanauer, 14, $5,600; Crescent, 15, $8,300; Hanauer, 15, $2,700; Ontario, 16, $20,382; Minnie Moore, 16, $3,012; Hanauer, 16, $2,700; Minnie Moore, 17, $3,820; Hanauer, 17. $2,750; Crescent, 17, $3,250; Minnie Moore, 18, $1,910, The banks of Salt Lake City report the receipt for the week ending January 14th, inclusive, of $79,859.45 in bullion, and $24,140 in ore; a total of $103,999.45.

IN Inyo county the people generally have signed a petition for a reduction of salaries, as provided by the County Government bill, to a figure that the county can pay and live. Under the present law it will take about all the revenue of the county to pay the salaried officials. By some accident Inyo was salaried considerably beyond its means when the law was enacted.

DELINQUENT NOTICE.

Eureka Gas Company.—Location of principal place of business, San Francisco, Cal. Location of works, Eureka, Humboldt county, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied December 3, 1884, the several amounts set opposite the names of the respective shareholders, as follows:

	No. Certificate.	No. Shares.	Amount.
Burling, James W	23	3	3 00
Burling, James W, Trustee	29	200	200 00
Burling, James W, Trustee	30	200	200 00
Burling, James W, Trustee	31	100	100 00
Burling, James W. Trustee	32	200	200 00
Burling. James W, Trustee	33	200	200 00
Burling, James W, Trustee	34	100	100 00
Condiet, J Elliot	24	2	2 00
Smith, Claude L	2	5	5 00
Smith, Claude L	22	200	200 00

And in accordance with law, so many shares of each parcel of such stock, as may be necessary, will be sold at public auction at the office of Cobb & Co., No. 321 Montgomery St, San Francisco, Cal, on Monday the 2nd day of February, 1885, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

C. S. BATCHELDER, Secretary.

OFFICE—302 Pine St, San Francisco, Jan. 15, 1885.

ASSESSMENT NOTICE.

Fremont Mining and Milling Company.— Location of principal place of business, San Francisco, Cal. Location of works, Amador county, near Drytown, Cal.

NOTICE is hereby given that at a meeting of the Trustees, held on the twenty ninth day of December, 1884, an assessment (No. 1) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourth day of February, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday the twenty-seventh day of February, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Sec'y.

OFFICE—No. 402 Front St., Room 8, San Francisco, Cal.

Carr's Electro Amalgamating Process.

Mr. Samuel Bear is now in the city, and will be pleased to confer with parties having Gold Ores who experience difficulty in working them. The Process will treat Free-Milling Ores, and also Sulphuret Ores without roasting, and recover a high percentage at no greater cost than by plate method. All those interested will find it beneficial to examine the process. Liberal inducements offered. Letters addressed to SAMUEL BEAR, Box No. 1, "Mining and Scientific Press" Office, San Francisco, will receive his attention for interview.

Photo Relief and Wood Engraving

AMONG the late discoveries in the Economic Arts stands prominently that of Engraving by the Art of Photography. While the new methods and processes greatly lessen the cost of producing the special kinds of printing plates most suitably made by the aid of photography, one of the best results gained is the perfect accuracy that is obtained.

Improvements are being continually made through more experienced workmanship, and ingenious and wonderful inventions that are exceedingly interesting and useful.

Portraits of men and women are made remarkably perfect in likeness. The same of animals plants, flowers, fruits, vegetables, landscapes, buildings, etc.

Nearly all kinds of engravings for books, pamphlets, trade catalogues, circulars, cards, handbills, labels, certificates, and other varieties of printing, are made with great advantage and desirability.

Some kinds of illustrations can still best be done on wood, and will long continue to be so made, for various reasons. It is our purpose to use the best available methods for accomplishing economically the most satisfactory results, and work is therefore solicited for all kinds of engraving.

All Publishers, Printers, Societies, Schools, Companies, Scientists, Professional Men, Merchants, Stock-raisers, Horticulturists, Mechanics, Manufacturers, Tradesmen, and all others requiring Engravings, should call and inquire, or write particularly for any further information desired, to the OFFICE OF THIS PAPER.

On inquiring prices, send samples of work similar to that desired, when practicable, or otherwise give as clear an idea as possible of just what is wanted.

☞Satisfaction guaranteed on all orders.

INTEREST IN A QUARTZ MINE.
I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address
A. CHAMBERS,
Jackson, Amador Co., Cal.

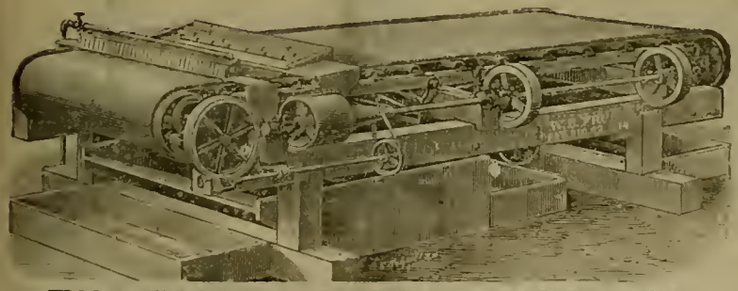
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, JANUARY 31, 1885. VOLUME XLXX. Number 5.

Street Railway Propulsion.

While we in San Francisco are largely interested in the development of our cable railways, in other cities the same prejudice in their favor does not exist, and other methods are proposed, economy of power being the argument in favor of each method put forward. If the advocates of each system will take the pains to test practically the actual amount of power required for the movement of trains taking a fair average of traffic over each kind, then a more reasonable comparison can be made of the economy of each.

For the system which has grown up in San Francisco, we have some data acquired by Mr. W. W. Hanscom, taken from the actual conditions of each of the cable roads in this city, and we find that the average proportions of power consumed in drawing cable, cars and passengers, are for cables 68 per cent, cars, 28 per cent, and passengers 4 per cent of the total power. As the earlier constructed roads have larger averages for moving cable, and smaller for moving cars and passengers, so the later constructed roads have smaller proportions for moving the cable, so that as experience has improved the construction, we are enabled to be assured of the cable requiring not more than from 50 to 60 per cent of the total power consumed, and these not under the most favorable conditions.

We notice the suggested application of electricity for the movement of trains on the Brooklyn bridge, and also on the elevated railways of New York city, and the Railroad *Gazette* publishes the estimates of Professor Farmer, as to the cost of electricity when applied to this service. He assumes that the dynamos and electric motors, will deliver 81 per cent of the indicated power of the stationary engines in useful work in propelling trains, but this seems to be all estimate, without any actual experience to corroborate the assertion; for it seems that in Prussia, at the Zankerode colliery, a railroad worked by electricity has been in use for over two years, the line, electric motors, etc., being made by the well-known firm of electricians, Messrs. Seimens and Halske, of Berlin. The result on this road is that only 30 per cent of the indicated power of the stationary engine working the dynamo, is developed by the electric motors. Further improvements may develop a greater per cent of useful effect, but we do not yet see that the friends of the cable railway system, need have any present fears of the economy and other advantages of that plan being much exceeded by any other, even if it may be equaled.

An Important Association.—An association has recently been formed in Mexico under the name of the "Universal Mechanical Agency" for the purchase and shipping of machinery and all kinds of manufactured articles to any part of the country. M. Gonzalez Marron is the general agent, and Pablo Bonnemo, Elexandro Quijano, M. Pastor Valdes and Plutarco Rodriguez, agents in this city, Puebla, Vera Cruz and Orizaba, respectively. The agents undertake to furnish skilled machinists to attend to the setting up of machinery when such help may be desired. If this association is really what it pretends and seems to be, it will be well for our manufacturers and others interested in building up a trade with Mexico, to lose no time in early making acquaintance with it. Its assistance will, no doubt, be sought for with alacrity by people of other countries seeking to introduce their goods into Mexico.

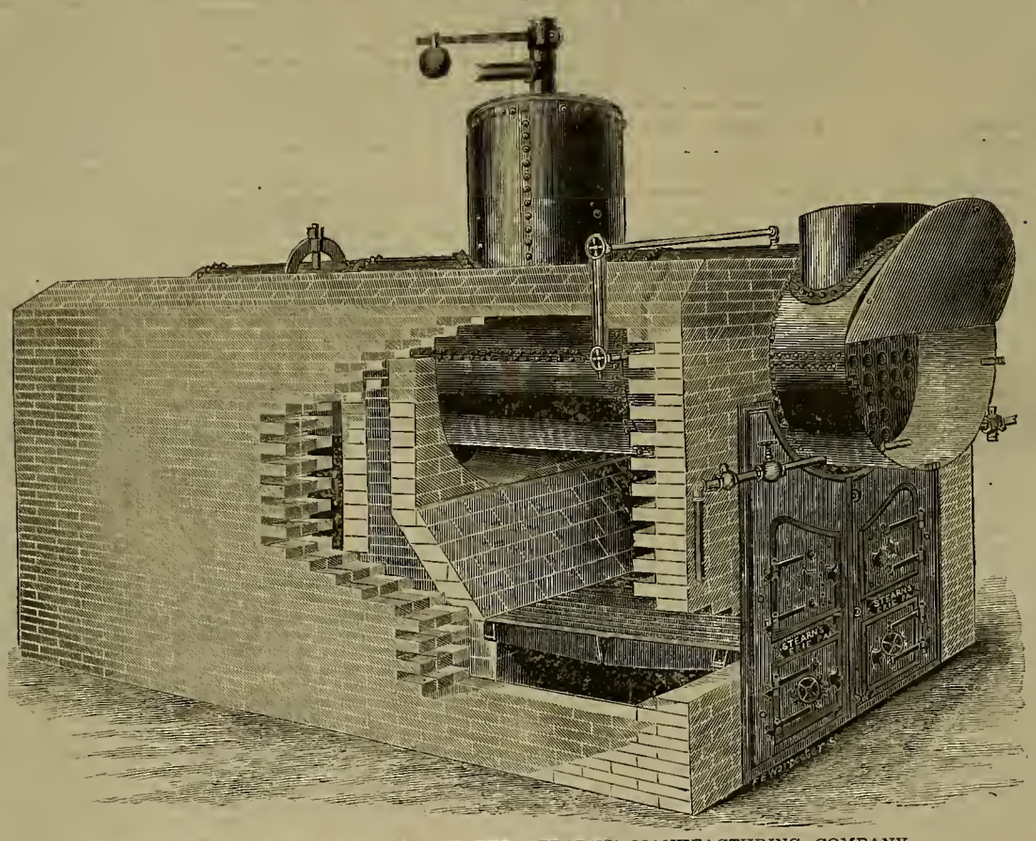
The director of the Geological Survey, in his December reports, says: Dr. C. A. White has made a special study of certain fossils collected in the Valley of the Sacramento, and the result of this investigation added to the information obtained by Assistant Geologist Diller, who made the collection, clearly shows the Tejon group is not the only coal-bearing formation in California, and further indicates that this coal of the upper Sacramento is of the same age as that of Vancouver Island.

The deepest gold mine in the world is the Eureka, in California, which is down 2,200 feet or 500 feet below the level of the sea.

The Stearns Stationary Boilers.

The engraving on this page represents one of the stationary tubular boilers such as are made by the Stearns Manufacturing Company. They are economical in the use of fuel and readily set. They are furnished made of steel of 60,000 pounds tensile strength, flange iron of 55,000 pounds, with fire top sheets over fire if desired, or of C. H. iron of 45,000 to 50,000 pounds tensile strength. The boilers are all tested and inspected before shipment by a responsible steam boiler inspection and insurance company. Some 18 sizes of tubular boilers are made by the company, and orders can be filled in a short time. The greatest care is taken in making these boilers that they shall be strong and safe, that is they endeavor to combine such materials, workmanship and proportions as will produce work in which confidence can be placed, and in which as far as human foresight can provide, absolute safety is secured. To this end they procure iron and rivets of the best brands known to the trade, insisting upon a careful inspection at the rolling mill, and making another inspection during manufacture. All imperfect sheets are rejected.

Good material and workmanship must go hand in hand, or the boiler is unsafe and worthless. In all cases the rivets must be so spaced that the metal left between the rivet holes is as nearly as possible of the same strength as the rivets, and such riveting must be used as will fill the holes full of metal, making each rivet bear its share of the strain. Unless this is carefully carried out a boiler is no stronger built of 70,000 pound tensile strength metal than of 45,000-pound tensile strength metal, because if the rivets are the weak place they will not be stronger in steel than in iron. Realizing this fact, they use the best rivets, driven by heavy pressure, filling the holes full from head to head, spacing them according to thickness and strength of sheets. Making staudard sizes they are enabled to provide expensive jigs and templets that lay off the holes perfectly, so that all holes come fair, and nothing is slighted.



STATIONARY TUBULAR BOILER OF THE STEARNS' MANUFACTURING COMPANY.

In this connection, the manufacturers say: "The objections urged against machine riveting are puerile in the extreme, and serve only to display the ignorance of parties asserting the old, old story of the superiority of the old over the new. They forget or ignore the fact of crystallization, which is the inevitable accompaniment of hand riveting, and the cutting of the sheet by the hammer face, thus adding to the weakness caused by punching, while the rivet, which under the blow of the machine piston is thoroughly upset while hot dan ductile, and fills the hole completely at a single blow, when driven by hand, rapidly chilling, is rarely made a perfect job. Experiments made with cross-sections cut through seams and rivets, formed by both processes, have demonstrated the marked superiority of machine work over hand riveting, in some instances showing nearly 25 per cent greater T. S. in the former than in the latter."

All boilers of this make of 36 inches and over are double-rivsted on the side seams. The thicknesses of the sheets are so proportioned that their strength is six times greater than the ordinary working pressure of 80 to 100 pounds per square inch. This allowance of strength is according to rules established by the United States inspection laws. A double-riveted boiler is allowed to carry 20 per cent more pressure than a single-riveted boiler.

The Pacific branch of the Stearns Manufacturing Co. in this city will shortly occupy a new fire-proof, two-story building, Nos. 29 to 31 Spear street, which they are now erecting. They will occupy the entire building.

The Worcester *Spy* reports that several foundries in that city have tried the cheap Southern iron which is now being pushed in the northern markets, and found it so deficient in strength that they will not use it.

Swept Out to Sea.—During the recent storm the Clatsop Mills Company's wharf at Astoria, and lumber and laths valued at $4,000 were swept out to sea. Only a small portion was recovered.

CORRESPONDENCE.

We admit, unendorsed opinions of correspondents.—EDS.

The Mineral Belt of Amador County.—No. 4.

EDITORS PRESS:—In my letter of last week I promised to continue the description of the mines on this mineral belt. The next north to the Marlett quartz mines, of which I spoke in my previous letters, is the St. Julian. This is 600 by 1,300 feet, and joins the rich Nevills or Mammoth mine, of Jones, Nevil's and others. The late Judge Moore, of Jackson, was the principal owner of this mine; in fact, it belonged to what is called here the "Court-house ring," being the judge's clerk and deputy clerk of the court. Some 10 months ago rich rock of the same character was found here, the same as that found in the Mammoth mine, north of it. A tunnel of 250 feet is run into this mine, west of the ledge, from which nearly $15,000 has been taken out in the past 8 or 10 months. I was at the mine recently, and found John Price, ex-Deputy Clerk, and one of the owners at work. They are about sinking on ore from the bottom of the shaft, some 100 feet from the north of the tunnel, where doubtless they will find a continuation of the rich black gold metal found some months ago, when they were at this point in the tunnel. The clerk of the Superior Court, Thomas Conlin, his deputy, John Price, and A. Caminetti, of Jackson, with the late George Moore, are the joint owners. This mine is supposed to be second only to the Mammoth in riches of black gold-bearing ore. A small stamp mill is on this St. Julian, but no less than $100,000 worth of machinery is required to work successfully, this or any other gold quartz mine.

The next quartz mine, and which joins this, and also the rich Mammoth mine, is the Neville, or

Mammoth Mine No. 2.

Here on the surface, is the identical quartz and other appearances of the Mammoth; but as yet, this mine is undeveloped, and is owed by Dr. Chambers, who resides here upon his Belle Monte ranch adjoining this mine, his cottage being only a short distance from his mine. Five minutes or less time, will take you from Belle Monte cottage (the doctor's residence and home) to the Mammoth No. 2 mine. Here is a chance for parties with a few thousand dollars, to get in on the "ground floor" with the doctor in this mine, by sinking two or three shafts one or two hundred feet deep, and running cross cuts and levels every 50 feet from these shafts, to ascertain the width and extent of this mine. The doctor's post-office address, is Jackson, California. No better opening upon this whole belt or Mother Lode, is to be had than the opening up of this Mammoth No. 2. The parties who may be so fortunate as to get in with him in this mine, will doubtless find themselves bonanza kings in the near future. The very rich Mammoth mine of Senator John P. Jones, Nevills and others, of course, need no further mention than has been given them in the former articles I have written you, as it stands second to no quartz mine, perhaps, in America or the world.

The Valparaiso and Wetzler's Mine.

The next quartz mine north is the Valparaiso mine. This joins the Mammoth mine and has a tunnel of 100 feet run upon it; also 500 or more feet of an open cut down the hill to near its northern boundary in Murphy's gulch. This open cut exposes the ledge nearly the whole 500 feet, and rich gold has been taken out of this lead, which is the first lead patented in this section of the county. This is 600 by 1,500 feet, and is owned by E. Ginochio, *et al* here. Mr. Ginochio is, perhaps, the heaviest of all our merchants in Jackson, Amador county, California, and an old resident, if not a "49er." This Valparaiso mine is only second to the Mammoth in richness, and as it joins it on the north will doubtless form a Bonanza King mine when it is, like the rest, worked with $100,000 worth of machinery. Mr. Ginochio owns 3 or 4 other rich, gold, quartz mines here but works none of them. He owns the Jackson mine in the town or village of Jackson, which has a fine engine and hoisting works upon it, with good large buildings over it. He will sell any or all of his mines, as he never intends to work any of them, he being strictly a heavy wholesale and retail merchant, and wishes to be nothing else.

Adjoining the Valparaiso is the quartz mine John Wetzler. This is an old mine from which Mr. Wetzler has taken out many thousands from the gulches by sluicing and by open cuts. There are two or three tunnels of 100 to 200 feet on this property which have lain idle and filled up at the mouths for years. As Mr. Wetzler owned and sold the St. Julian mine before referred to one year ago to the late George Moore, he has not cared about working or prospecting this mine, and takes the world easy and as it comes, until a week or two ago, when he got tired of doing nothing, and had just got the last payment from the "Court house ring," already referred to in this article, who owned the St. Julian mine; when with another man he went to work in one of these old and abandoned tunnels, and in a week or less time they struck a vein of as fine quartz as ever was crushed in any mill. I was to-day in this tunnel and Mr Wetzler showed me through it; it is only second to the rich Mammoth, which it joins or comes on to. They have to-day and for two days past been pounding out the gold with two hand mortars, he having tin cans full of rich native gold. The lead of quartz is twelve to fourteen inches wide, and is upon the hanging wall. The vein is thirty feet wide to the front wall and gauged seams with slate between and one hundred and fifty feet from grass-roots. The next mine north is the

Kelly Mine.

This has a 20 stamp mill, and a good one, and about 1,500 feet of tunnels, good large blacksmith shop, office, stable, a large boarding house and another large sleeping house upon it. This mine has been idle for the past two years, owing to litigation, which is now about at an end, when this property will start up. The next mine of importance is one-half a mile north of this mine, and is called the Amador Queen mine. This is in Hunt's gulch, and also in Murphy's gulch and ridge. Some 2,000 or more feet of tunnels and 1,000 feet of levels and cross-cuts are in this property. About 3,000 tons of low-grade ore lays upon dumps at different places on this mine, and a small roller mill is being put up to crush the ore. Most of it has lain on the dumps for years past. Mr. S. D. Shugart has just returned from "Frisco," and purchased a mill which got to the mine yesterday, while I was there. Mr. Shugart and James Morgan are the owners of this rich mine and property, with a 20-stamp mill and a number of houses upon it. Mr. Shugart is a Pennsylvania man, and has been in Sonora, Mexico, for years, where he also owns a rich silver mine which he is now working there. Some $75,000 has been taken out at the Amador Queen mine, and from the 400-foot level, and the cross-cuts and levels above this, they have some hundreds of tons of rich milling quartz laying ou the dump, and are taking out every day tons of this rich ore. An air compressor and two Burleigh drills are used in this mine.

I will finish my description of this mineral belt in next week's PRESS. WELLINGTON.

A Proposition for Assayers.

[Written for MINING AND SCIENTIFIC PRESS by C. H. AARON.]

The system which I propose is new from one point of view, and not so from another. It regards the weighing of substances to be assayed. In those cases in which the substance sought is actually obtained it has always been usual to take either 100 parts, a simple multiple of that, or an aliquot part of the same. The weight of substance got is then either its percentage at once, or it must be multiplied or divided by a simple number for the percentage, for, if the substance assayed consisted wholly of that sought, the weight got would be equal to the weight taken. On the other hand, in that class of assays in which the quantity of the substance sought is indicated by that of a different substance got, as, for instance, in the wet lead assay, and in all stoichiometric work, the weight taken is usually 10 or 100 parts, or a simple multiple, and of that but the weight got has to be multiplied by some often inconvenient number in order to find out how much of the substance sought it indicates.

What I propose is, to take in all cases, such a weight of the assay substance as would give 100 parts (or a simple multiple or aliquot part of that), of the substance to be got if the assay substance consisted wholly of the substance sought. The resulting weight would then always be the percentage, or would require only to be doubled, halved, etc., for the percentage. An example of this method occurs in "Leaching Gold and Silver Ores," in the assay of manganese binoxide: the workman is directed to take 99 grains of the assay substance, because that quantity of pure binoxide would cause the evolution of 100 grains of carbon dioxide so that the weight of that actually evolved in the assay is equal to the percentage of binoxide in the sample. Is this not more convenient, as well as more rational, than to take 100 grains for the assay and then have to go through a calculation in order to arrive at the result required? It would be easy for the writers of books on assaying to inform the student as to how much of a substance to take for an assay on this principle.

In the wet assay of lead, for instance, the lead is got as sulphate, which contains 68.329 per cent of lead. If 68.3 or 68.33 parts of the sample were taken for the assay the weight of the sulphate got, in similar terms, would be the percentage of lead in the assay. In the iron assay, if the sesquioxide is to be got and weighed, take 70 parts of the ore and the weight got will be the percentage of iron in the assay. When zinc is to be got as ammonia phosphate, take 36.5 parts. For sulphur, to be got as barium sulphate, take 13.8 parts. For nickel as oxide, 78.7 parts; copper as oxide, 79; copper as xanthate, 33 &c.

Whatever saves time and trouble, practically lengthens life for usefulness or pleasure.

THE IDAHO *Democrat* predicts that the Seven Devils country about 150 miles or so north of Boise, will be the mining attraction of next season. There is a district there, many miles in extent, in which rich silver and copper ores have been found.

The Mining Stock Business in San Francisco.

At the recent annual meeting of the San Francisco Stock and Exchange Board, the retiring president, Geo. T. Marye, Jr., who was at Virginia City, Nev., sent a letter which was read to the Board. In the course of this letter he made the following pertinent remarks:

"Writing from this place I cannot but experience the feeling that the palmy days of the Comstock are over: But while recognizing and regretting this, I still do not feel discouraged. There will always be a Stock Exchange in San Francisco, as in all the other great commercial centers of this country and of moderu Europe. The only question with us is as to the amount of business our Exchange will have. Of course the vast bulk of our business in the past has come from the mines of the Comstock. To them we owe the colossal movement of the Crown Point and Belcher era, and the unparalleled activity of the great Bonanza period. But we have also had during that time periods of excellent business from other sources. You all remember the Meadow Valley, the White Pine, the Raymond & Ely, the Eureka and the Bodie excitements. Similar discoveries will occur again, and, let us hope, with increasing frequency. We may be on the eve of such a development, or even of a greater, now in the Quijotoa district. Nor must it be supposed that we are to be deprived of the Comstock altogether. The bullion product of the Comstock is still large. During 1884, which was a year of great depression, it amounted to nearly $2,500,000. And this yield will probably be much increased by further reductions in the cost of working the ore, which will make it profitable to take out large quantities of low-grade ore, which has until now been neglected; and this, we may reasonably expect, will greatly add to the value of the stock in the mines. Recent developments, too, in what is known as the Six-mile Canyon, seem to justify the hope that new and paying mines may yet be discovered in Virginia. In the deep mines the indications are as good on the 3,000-foot level as they were at or near the surface, and we all know what a strike in any of them would mean. San Francisco is, and will remain, the center of the mining industry in this country, and it is likely that trading in mining stocks will constitute the major portion of our business. But we should continue to give ever-increasing attention and encouragement to dealings in local and miscellaneous securities, and I can see no good reason why the stocks listed in the New York market should not be dealt in here in our Exchange. They are, in other cities of the Union, and even in London. Doubtless it would be a work of some time to build up a business in them, because we should have not only to provide the means of transacting it, but to attract the attention of the public to it afterwards. But the work is perfectly feasible, and I would recommend that the Board take action in the matter, and to that end they open a correspondence with our fellow member, Mr. C. A. Kinney, who is now in New York, and who has always been in favor of this step.

Copper City, Shasta County.

Our people are feeling very good, says the Republican *Free Press*, over the veritable boom in store for Copper city, which is tributary to and will materially effect the business interests of Redding. Spruance & Stanley, of San Francisco, after 10 years of litigation and an expenditure of $20,000, have established their title to the Winthrop mine, and have recently leased the same to Dickson, DeWolf & Co. and Charles Cusheon Jones, of San Francisco, for 10 years, with the express provision, so we are informed, that the company will work the mine continuously during that time. As a result of the transaction Mr. Jones arrived several days ago, full handed and prepared to actively commence operations. He was accompanied by a gentleman named Catton, who will act as cashier of the company, and by Mr. Stewart, formerly of the Afterthought mine at Furnaceville, who will have charge of the mill, and who, by his experience in metals, is thoroughly qualified for the position. Mr. Stewart is familiar with all the processes known, by which base metals are worked, including the process used at Swansea. He was the only man who ever succeeded in working the base metals of the Afterthought satisfactorily, and had he been backed up by the stockholders of the mine as he should have been, it would he running successfully to-day. The ore of the Winthrop mine has been thoroughly tested in a dozen different ways and by various processes, and Mr. Stewart and the managers are so confident of success that they are willing, and in fact are preparing, to invest heavily. As a guarantee that there is no child's play about their undertaking, Mr. Jones has purchased the old mill, assay building and other buildings, which, when the Extra company hursted up, fell into the hands of Mr. A. Potter. The machinery of the old mill will be taken out, at least such portions as are not needed, and will be replaced by new machinery adapted to the process which they propose to make use of. In addition to this Mr. Jones has now at the depot shovels, picks, drills and other tools necessary to open up the mine, sink shafts, run tunnels and extract ore, and as soon as the roads get in proper condition these necessary tools, together with other supplies, will be transported to Copper city. In fact, a few articles have already been sent thither. No miners will be employed for at least 90 days, when a force will be put on and Copper city will be a scene of great activity. Mr. Catton informs us that there is at present about 1,400 tons of good ore on the dump, sufficient for all present purposes. One thing is certain, there is an abundance of coin to back up the enterprise, and the earnestness displayed in preparation is a good augury of success. Although Copper city has had many ups and downs, those who are best acquainted with its mineral wealth have never, for a moment, doubted its ultimate triumph, and all that is necessary to insure its permanent prosperity is capital, skill and an honest purpose on the part of the superintendent and managers, with no gouging of stockholders. With honest, legitimate mining Copper city will become one of the best mining camps in the State.

The Silver Question.

The Governor of the State of Nevada, in his message referring to request to appoint delegates to the Silver Convention of Denver, says: The gentlemen composing this committee represent the leading producers of silver in nineteen counties of Colorado. I deem the subject of sufficient importance to justify me in calling your attention to it, and to invite you to take such action as you may consider best to have the State of Nevada properly represented in said convention.

The silver producers of our State feel justly alarmed at the unexpected hostility lately manifested toward our leading industry, and are solicitous that prompt action should be taken to prevent, if possible, further degradation of silver as money, and prevent the repeal of the law authorizing the coinage of not less than $2,000,000 per month.

In his late annual message to Congress, President Arthur recommends that the coinage of silver be stopped. The Secretary of the Treasury makes a like recommendation in his annual report. Bills have been introduced in both Houses of Congress to carry out their recommendations.

I ask that no time be lost in memorializing Congress against the adoption of this unfriendly legislation.

Had it not been for the injustice done us by the Federal Government, we would have the same right of coinage for our silver that we have for our gold.

Having deprived us of a portion of our right of coinage, the Government now proposes to degrade silver to an equality with the base metals by denying it all value as money. The mere recommendations contained in the President's message reduced the market price of silver over three cents per ounce. Should Congress unfortunately pass a law in response to that recommendation, its effect would be most disastrous to the leading interests of our State, and would probably result in shutting down many mines, not only here, but also in Colorado, Utah, Arizona, New Mexico, Idaho and Montana.

The terrible blow would not be felt by the miners and mine owners only, but the thousands of farmers, laborers and transport companies, who are employed in furnishing supplies of various kinds to those engaged in mining, would be shut off from a market, and widespread ruin would supplant fair prosperity in two States and five Territories.

I know I can rely on your patriotism and sense of justice to do whatever is in your power to prevent the accomplishment of the wrong that now threatens our greatest industry.

There is no doubt about our having the co-operation of all the silver-producing States and Territories in our efforts to secure the welfare and protection of our constituents.

The Convention at Denver is the first step toward bringing together the representatives of our threatened interests, and may result in such an expression of popular sentiment in the States and Territories engaged in silver mining as not only to defeat the unjust and pernicious legislation recommended by the President, but may result finally in restoring to us our equal right of coinage of both gold and silver. Should Congress not indulge in any further unfriendly legislation, and, in fact, reject that which is now pending, we would have reason to hope that the present efforts to develop mines would be encouraged and greatly increased, and would reasonably anticipate the revival, at an early day, of our mining industries, and, as a consequence, the restoration of general prosperity, which we know is dependent in this State on successful mining.

THEORETICAL GOLD MINING.—A few years ago some theorists spent several thousand dollars in attempting to pump the golden sands from the bottom of Snake river by a vacuum process in order to wash out the gold. They had a large boat on which was an immense steam boiler and a steam cylinder in which a vacuum was produced by the injection of cold water by which the sands were sucked up to be washed. The great cylinder and some other parts of the machinery are lying along the shore—the only monument of their folly. Others are now constructing ditches to take the water from the river above the rapids, and propose to work the placers of a bar below by a more practical process and it is hoped that they will be more successful.

MECHANICAL PROGRESS.

Progress in Steel Manufacture.

Steel manufacturers, says a correspondent of *The Age of Steel*, as a class are proud to the closest adherence to the processes of the forefathers, and new beginners generally are the ones who largely introduce new processes. In the conversion of iron into steel for various purposes different processes are a necessity, for those days when knives, scissors, razors, pins and the like were all cut from the same stock of steel have passed long ago, and now we work in a special manner the metal intended for specific purposes.

Since the writer promised to answer all questions, we have had letters not a few regarding the various processes of tempering and hardening steel economically; many more have asked for information concerning the substance called tungsten, and inasmuch as this metal will play an important part in this and subsequent discussions, we will give a description as gleaned from the latest authorities. The name itself is derived from a heavy stone, alluding to its great specific gravity. The chief sources from which the metal is obtained are wolframite, a tungstate of iron and manganese very often found in connection with native oxide of tin, and is found quite abundantly in various parts of the United States, especially near Monroe and Trumbull, Conn., and in certain portions of Missouri, Georgia and Alabama. Then in schulite, tungstate of lime produces considerable of it. Again, in portions of the country producing lead we find tungstate of lead; of copper and lime, or cuproschulite; of manganese and iron, or megabarite; of manganese, or hereberite; as well as in the native oxides, tungstic ochre, and in small quantities in samarchite, etc.

With the supplies of this country one would think that the shipments of this ore from England, Russia, Bohemia, Bolivia, and other foreign ports to this country would cease; but we learn that most establishments using this metal import their supplies, though the deposits of Connecticut find ready markets near home. Our Southern and Western deposits, however, are not worked to any great extent as yet, something very strange when we take into account the quantity and ease of mining.

Possibilities of Further Improvement in Steel Manufacture.

A good quality of cast iron contains about 5 per cent of carbon. When this is all removed but say about 1 per cent we have steel. On the strength of this discovery, made by chemists not a great while ago, entirs new processes were introduced, and most of the best steel is now made from malleable iron; hence in some stage of the process connected with the conversion of cast into wrought iron the metal must have passed into the condition of steel. Notwithstanding this fact, which to us appears incontrovertible, the majority of our manufacturers deem it best to take all the carbon out of the cast iron, subsequently restoring by a tedious and expensive process, or rather series of processes, a mere fraction of what they have already taken out and thrown away. Here are opportunities for the greatest decrease in the cost of production, a question now keeping still and silent a large proportion of the steel-producing establishments in the United States, and as sure as the required cash is placed at the disposal of competent analysts and cautious investigators just so sure will the cost of converting iron into steel be decreased, the principal cost now being the expulsion of the innate carbon and subsequently replacing.

In conclusion, when we forcibly drive off this carbon, which in this respect assumes the character of extraneous matter, we leave its place unoccupied; hence the necessity of making shear steel from blistered steel. This cutting, heating and forge work is all attended with great expense of fuel and mechanical energy. Of course, we may make crucible steel, but this question of heat, power and loss of material again protrudes, and we find our goods on the market at very small margins for profit. Mr. Bessemer made a wide stride toward solving this problem; but stopped far short of ultimate success. He went sufficiently far, however, to work an entire revolution in the processes of steel manufacture; but the embarrassments and ridicule attending even his achievement are so well known that we need not discuss them; suffice it to add that the word Bessemer is already engrossed on tablets that ten thousand years will not efface.

CHANGING HARD INTO SOFT CASTINGS.—In a communication to the Academie des Sciences, N. Forquignon states that when whits iron castings are heated to a point a little under that of fusion they become transformed into gray iron. The change is due to the separation of carbon from its previous combination with the metal, and its deposition in the hulk of the casting. By careful experiments recently conducted, M. Forquignon has found the following results: He heated a number of white iron pige for 172 hours in a stove from which the gas was carefully exhausted, and afterward analyzed the product. The iron originally contained 3 per cent of combined carbon, while the material as taken out of the experimental furnace was found to contain only 0·895 per cent of carbon in combination, and 2·061 per cent of carbon in the graphite state. The change must have been due wholly to the slow and continued heating of the metal. It is not stated whether there was any perceptible difference between the outside and inside of the metal under treatment, which might be expected under such conditions. The process has a certain resemblance to the usual method of softening steel, in which the effect of continued heating is to decompose the mixture of pure metal and carbon.

The Use of Files.

Considered in the abstract, there is more real science connected with the use of a file than in its manufacture, though all are willing to accord to the progressive makers the praise due the improvements of this very important workman's tool during the past few years. To properly use a file is apt to be considered a system of education beneath the dignity of the smart apprentice, in fact it is rarely, if ever, that the apprentice is instructed in the use of the file at all save to be able to draw the tool smoothly across the article to be filed, regardless of the care of the tool itself. Indeed, we question very much if in a large shop there are many artisans who know how to preserve as well as use the file, the principal idea being to get a certain amount of work done regardless of the wear, often needless to a great degree, of the tool.

If we will take the trouble to examine carefully the make-up of a file, it will be noticed that it is among the impossibilities to so temper a bit of steel that after the same has been subjected to the treatment necessary to make the rough edges or "teeth," that the temper will be the same throughout; hence, if we wear it more in one place than another, it will soon refuse to do even work. Again, in drawing the file, when the tool is pushed from the operator, a certain proportion of the hard tempered metal is turned toward the operator, now, if in the backward motion the file is allowed to bear on the substance to be filed, it is crowded forward in proportion to the amount of force applied, hence, only a few strokes are needed to break off the outer or keenest edge of the tooth, whereas if the file was not allowed to touch the substance being filed, the steel would continue to bend toward the operator, and would wear off smoothly, and not become uneven or jagged along the outer edge, which soon condemns a file for fine work. Then, again, these minute and evenly made furrows in the best made tools soon become, as it were, clogged by means of the small bits of worn-off steel having the temper drawn by the heat generated by friction during rapid, hard work. These little particles soon aggregate to that extent that the file is rendered impotent for nice, even work, as shown by the great amount of rough filing seen in any shop where apprentices are allowed to file away regardless of the results as effects a continuance of the useful life of a file. These are little things of themselves, but in the aggregate they amount to no small amount in the cost of manufacturing.—*The Age of Steel.*

"POUNDING" IN HOT WATER PIPES.—This disagreeable noise is mostly owing to defects in planning the steam and return pipes, either in their position or relative size. Sometimes heating engineers are hampered by architectual conditions. Occasionally engineers are negligent in failing to blow the air out of the pipes. Much of the trouble arises from partially opening the radiators, causing the water accumulate in them, when upon fully opening such a radiator, the water rushes into the return pipe to disturb a whole building by its vibration. Much more of this trouble occurs in moderate weather, when in most large buildings a large number of radiators are closed or partially so; the connecting pipes leading to such radiators become partially filled with water, the vibration of which causes the noise.

POWER AND STRENGTH IN RELATION TO MACHINERY.—The machinery of an engine to work at 300 pounds must, only to do the same work, be seven times as strong as that which works at 20 pounds. Here, then, is a fatal objection against the use of steam at high pressure, unless it can be met in some way. This is where the advantage of compound engines comes in. While the pressure in the one increases from 76 to 438, the other increases from 63 to 112. Thus by the use of compound engines the pressure on the pistone can be kept quite within reason.—*Ex.*

THE WELDING CAPACITY OF IRON.—Dr. Wedding has been making experiments on welding which give some important results. He shows that capacity for welding increases with the amount of silicon present, and decreases with any excess of manganese. The latter acts by interfering with the crystalline structure of the iron, and confirms Ledebur's idea that all adventitious bodies influence welding in proportion to their amount.

ROTARY ENGINES IN DEMAND.—Rotary engines are coming more and more into general favor at the East, as is attested by the increased number of them that are being made and sold. One large manufacturer of such engines says that they are now receiving orders for from two to five of their rotary engines per week, and that those sold have given the highest satisfaction.

SCIENTIFIC PROGRESS.

The Santa Barbara Natural History Society.

We are pleased to note from a late number of the Santa Barbara *Independent*, that the Natural History Society of that town is in a flourishing condition. Its annual meeting was held on Nov. 25th, at which the president gave a brief review of the complete and interesting reports of the officers; dwelt upon the fact that the society is now fully equipped with a permanent home in these delightful rooms, the generous donation of the owners of the Library Building. He spoke of the growth of the society, its increase and interested membership; of the valuable additions to Library and Museum, especially the donations to the herbarium and the 400 land shells; also of the magnificent painting, the loving and gifted work of its honored secretary. He concluded by speaking encouragingly of the future outlook of the society, which, after all, would be just what its members might choose to make it.

The following officers were chosen for 1885: J. W. Calkins, president; Mrs. A. A. Boyce, Dr. S. B. P. Knox, and Rev. S. R. Weldon, vice-presidents; Virginia Forwerd, rec. sec; H. C. Ford, cor. sec.; Henry Muzzall, treasurer; Mrs. F. C. Lord, curator.

The curator reported a number of contributions to the museum and also to the library during the evening.

Cyclones for the Past Two Years.

Mr. Calkins read a few notes on cyclones which he had gathered during the past two years, and gave a quiet suggestion that it were well to bear some topic in mind, and note down the facts as they come under our observation, for future use. Of 600 cyclones occurring between the years 1794 and 1881, a period of 87 years, Kansas had 62, Illinois 54, Missouri 44, Iowa 32; New York and Georgia rank next. The general direction was from westerly to easterly; width, from 10 feet to 10,000 feet; average width, 1,085 feet; velocity, 12 to 60 miles per hour; average, 30 miles per hour. June is the cyclone month, April coming next. Of 217 recorded, 193 occurred in the afternoon, 1 at early dawn, one at sunset, 2 at noon, 13 in the evening, and but 7 during the night; greatest average of occurrence, between 5 and 6 P. M.; next, between 4 and 5 P. M.; and they usually occur in sultry weather. While it is stated that they never have occurred west of the Sierras, the membership demurred, claiming one bona fide one for Santa Barbara.

The Proposed Saharan Sea.

With reference to the daring French project for flooding the desert of Sahara with what would be virtually a new sea, it may be well, says *Engineering*, to recall the opinion expressed by M. Elisee Reclus, that at one period in the world's history the desert was covered by a sea very similar to the Mediterranean, and that this sea exercised a very great influence upon the temperature of France, as comparatively cold—or at any rate cool—winds blew over it, while now the winds which prevail in the great expanse are of a much higher temperature, and are, in fact, sometimes suffocatingly hot. The appearance of the desert seems to support the theory of M. Elisee Reclus, that it was at one time the bed of a sea of considerable extent, of which the great inland African lakes recently discovered are possibly the remains.

The present vast extent and configuration of the African continent would also appear to support the conclusion that at one time it comprised a less area of land than it does at present. The serious question which arises, assuming that the theory of M. Elisee Reclus is substantially correct, is: What will he the effect of the creation of a second African sea in the room of that which has disappeared? Would the temperature of France, and possibly even of England, be again reduced? It is a geological theory that in the glacial period of the world's history Great Britain was covered with ice and snow very much as Greenland is at present. Some great influences must clearly have been brought to bear upon France and Great Britain, which rolled the ice over so many hundred miles northward. What was this influence? Was it the large African sea which French enterprise is endeavoring to recreate? If it were, we should say that whatever the French may gain in Africa by the realization of a Saharan sea would be much more than counterbalanced by what they would lose in France itself.

THE CHANGE OF POSITION IN THE EARTH'S AXIS.—At a recent meeting of the Geographical Society of San Francisco, Vice-President Stevens read an interesting paper on the movements of the poles of rotation, or the change of position in the earth's axis, considered as the cause of earthquakes and the recent great convulsion of nature in Italy, Java and Alaska. The various causes which may be supposed to produce this change of position in the earth's axis of several degrees were considered, and their relative importance discussed. Chief among these causes were mentioned the deposits of immense bodies of sediment, as by the rivers of Thibet in Central Asia. The disputed question of the solidity or fluidity of the interior of the earth was also considered in its bearings upon the subject. The conclusion was that the problem presented was one difficult of solution, but this time might come when it would be so clearly demonstrated that the wonder would be why the matter had been thought so obscure.

The Position of Mountains.

It is a somewhat singular fact that the steep side of mountains is usually found on the side nearest the ocean. Dana, in his Manual, says that the position of the great mountain chains along the borders of the continents, and of uplifts, fractures, plications and volcanoes, are chiefly on the seaward slope of the chains, proving that while the force from contraction was a universal force over the sphere, the lateral pressure was vastly more effective in a direction from the ocean than in the reverse direction. Now this landward action of the force seems to be a necessary consequence of the fact that the crust over the oceanic areas was and is abruptly depressed below the level of the continental, so that the lateral pressure from its direction would have had the advantage of leverage beneath the continental crust, or rather, would have acted obliquely against it.

In the case of the Appalachians and the other ranges of the Atlantic border, the mountains front toward the ocean, that is, have their steepest folds on the oceanic side. The same is true of Andes in South America, and of our own Sierra Nevada Range along this position of the Pacific Coast. The same rule has a very general application on other continents. But there are exceptions. The Juras of Europe, on the contrary, front inland toward the Alps, and apparently because of their subordinate relations to the Alps, both geographically and genetically. In each case they were on the shoving side; while the greater fractures are usually toward the opposite side.

This condition of mountain deviation has nothing to do with the revolution of the earth, as some have supposed. It is the result of shrinkage, continental crumpling of the earth's crust. Of course this view is controverted by another class of writers, who attribute the mountains to the pressure of immense accumulations of sediments, which, however, does not seem to be sufficiently comprehensive. But the steep side of ranges is apt to be found on the oceanic side, as stated above, or toward the shoving side.

NEW FILTERS.—Two important filters are described in the *Journal de Pharmacie et Chemie*. The Chamberland filter consists of a porous cylinder of ground porcelain burned to such a heat that it is capable of transmitting liquids, but not solids. It is used in Pasteur's laboratory for separating microbia from their culture liquids. Pasteur has found that on filtering with it the most impure waters the germs of microbia cannot pass through it. In the Maigren filter the acting medium is a mixture of powdered hydrate of lime and of boneblack. This apparatus is said to be capable of removing not merely suspended but dissolved impurities.

TORNADOES.—It is a curious fact that tornadoes occur in the afternoon, 4 o'clock being called the tornado hour. They move from southwest to northeast, generally east about twenty degrees north, and their linear movement is ordinarily from thirty to forty miles an hour. Tornadoes occur on sultry days, or when the temperature is very high and the air is thoroughly saturated with moisture, and when the air is highly charged with electricity.

SECURE CORKS.—Tight-closing corks may be obtained by soaking good corks for several hours in a warm (about 50° C.) solution of 15 parts of glue or gelatin in a mixture of 24 parts of glycerine, and 500 parts of water. These corks may be made still more proof against acids, by dipping them, after being completely dried, for about ten or fifteen minutes in a warm mixture of 4 parts of paraffine, and 1 part of petrolatum.

THE FLOW OF WATER THROUGH ELASTIC PIPES.—A lecturer recently remarked that water or any fluid would flow more steadily, or produce a steadier stream, through an elastic pipe than through a non-elastic one, or in other words, through a rubber pipe than an iron one, other conditions being the same. If so, it must be because the elasticity of the pipe lessens the friction.

A SUBTERRANEAN OBSERVATORY.—Prof. Milne, of Tokio University, Japan, is about to establish a subterranean observatory at Takashima, in a very deep coal-mine not far from Nagasaki. The object is to determine the connection between earthquake phenomena and meteorological phenomena, such as storms, barometrical pressure, tides, tidal waves, etc.

PAPER BAROMETERS were first introduced from Paris, and can be made from soaking the paper in a solution of chloride of cobalt. It then becomes a hygroscopic. If it is now exposed to a current of air, it will change from blue to pink, according as the air becomes moist, regaining the blue as the moisture decreases.

NEW MATERIAL FOR PARTITIONS.—A scientific journal reports that a composition of sand, cork and lime moulded into blocks is now on trial in Germany for building light partitions. It is said to have the advantage of excluding sounds better than ordinary brick work, while being light and a good non-conductor.

Passing Events.

It may be noticed as of prospective benefit to California that there is now quite a demand for gold mines. It is not very pronounced as yet, but this summer there is little doubt that many sales will be made. The outlook for California mine properties is now as good as that in any other mining State or Territory.

They have had a little difference of opinion up in Idaho about the miners' wages question, which has attracted some attention, but the differences have been temporarily settled.

The Hanauer smelter, in Utah, recently burned, is to be rebuilt, but some of the other smelters are seriously talking of shutting down for a while unless the lead market improves.

The Wood River miners are shipping ore some 1,400 miles, all the way to Omaha, paying $25 a ton freight, and making money at that, while some of the local smelters are not running.

THE British army has now a field kitchen, the fire of which will go like that of a steam fire engine, and do its work while on the march.

An Increased Gold Product in California.

On account of the very low price of lead and copper and the discount on silver, there is now more of a demand for gold-mining properties than has been the case for some years. Attention is therefore being directed to mines in this State, and it is probable that we will hereafter experience an increase in the gold product rather than a decline.

The reasons for expecting an increase of gold product may be briefly stated as follows: First, we have the auriferous resources to warrant an early and very great expansion of the gold mining industry. The present output of this metal could, through the supplying of additional plant and the opening up of new mines, be doubled with profit in less than two years. Hardly more than one paying quartz lode in ten known to exist in the State has yet been brought into a productive condition. There is, to be sure, renewed interest and much activity being manifested at present in this branch of mining, and on this fact is based in large measure, our expectation of an increased gold production in the early future, there being good reason to anticipate for these efforts a generally favorable issue.

As we have auriferous quartz in such abundance, so also does California contain a great extent of unworked placer deposits, these latter having been exhausted only where they could be most readily reached and easily worked; such as the shallow prairie diggings, the gulches and raviues, including some portions of the river beds and most of the bars along the streams. This class of deposits, have for the most part been worked by methods and appliances so simple and inexpensive that it is a misnomer to call this kind of operatious mining at all. But having served their purpose, removing and working the material most easily reached, there still remains in this State, besides the innumerable quartz lodes, thousands of acres of hydraulic gravel banks, hundreds of miles of the old Pliocene channels and long stretches of the modern river beds untouched or but little worked, to say nothing of dry diggings, virgin because no water has ever been brought upon them, or the deep-lying basins that could not be worked for want of drainage. The time is coming, too, when the immense bodies of tailings that have accumulated along the rivers and gulches of California will be re-handled with profit, and the auriferous sands that stretch for so many leagues along her sea coast, will be turned to practical account. To fully occupy the field here opened to capital and labor will require a great many years; to exhaust it of its resources will be the work of many generations, perhaps of centuries. The enduring qualities of quartz mining in California find illustration in the Sierra Buttes property, which, after being steadily and profitably worked for more than 30 years without any sign of exhaustion, is yielding now more ore than ever before. Grass Valley, where quartz first began to be extracted and where this class of mining has been prosecuted for 33 years with energy and persistence is to-day the most prosperous quartz mining district in the State. The Empire mine, which turns out annually a million in gold, is situated on that section of the Mother Lode that has been worked extensively and without intermission for 25 years, these being only a few examples that might be cited, all of similar purport.

That a good deal of money has been heretofore lost in gold mining operations in California, cannot be denied. But such losses, while far less than have occurred in many other countries, are not going to happen to any great extent in this State hereafter. As before remarked, we have learned here the business of gold mining pretty thoroughly. We have brought our processes, methods and machinery to great perfection. Profiting by experience, we avoid now many of the mistakes of the past, practicing an economy, caution and system that only a few years ago were in most cases disregarded. In these improved conditions investors have assurances of larger returns and better general results in the future.

ABREAST OF THE TIMES.—THE MINING AND SCIENTIFIC PRESS, Dewey & Co. publishers, San Francisco, *the best* and most influential mining and scientific journal on the Pacific Coast, has just entered its sixtieth volume. It deserves and should receive the support of our mining community whose interests it zealously advocates. Terms $3 a year if paid in advance. —*Mountain Messenger.*

Measurement of Water in California.

Throughout this State great confusion has arisen from the absence of a generally accepted unit of water measurement in the system of distribution, from irrigation and mining ditches. There is a wide divergence in the customary methods of ascertaining what is known as the "miner's inch." As concisely stated by Mr. Aug. J. Bowie, Jr., in a paper on "The Measurement and Flow of Water in Ditches," read not long since, before the Technical Society of the Pacific Coast, and published in these columns, this term, as currently used, denotes "a quantity, which varies in almost every district in the State; no one gauge has been uniformly adopted, nor has any established pressure been agreed upon under which the water shall be measured. In some counties there are 10, 11 or 12-hour inches, and in others there is a 24-hour inch. The apertures through which the water is measured are generally rectangular, but vary greatly in width and length, being from 1 inch to 2 inches wide, and from a few inches to several feet long. The discharges are through 1-inch, 1½-inch, 2-inch and 3-inch planks, with square, or with square and chamfered edges, combined or not, as the case may be. The bottoms of the openings are sometimes flush with the bottoms of the boxes, sometimes raised above them. The head may denote the distance above the center of the aperture, or that above the top, and varies from 4½ inches to 12 inches above the center of the aperture," etc.

The advantages of our uniform standard in designating the quantity of water served are so generally appreciated as to require no special comment; but steps have been taken to suggest to the Legislature the adoption of a standard unit of measurement of water, and of one or more gauges for the accurate determination of the discharge.

It is thought purposely to establish a unit such as the "miner's inch," incorporating the element of time as well as of volume, without prescribing a fixed form of apparatus for its measurement. This seems scarcely practicable, as the conditions of allowable drop or head and quantity, to be delivered, vary so widely that no one form would be general in its adaptability.

It is believed that a simple volume unit, such as the "cubic foot," will be preferable to the "miner's inch," or even to the "cubic foot per second." It will be more general in its application and admit of the meter system of measurement.

No advantage would be sacrificed by the substitution of such a unit for a "miner's inch." The existing forms of gauges could still be effectively used. It would be necessary, however, to know definitely the number of cubic feet which the form of gauge used would deliver in an hour or a day under specified conditions; but provision could be made for this necessity by the recommendation of several permanent forms accurately described and authoritatively tested as to rate of delivery. In cases of controversy it might then devolve upon persons using apparatus other than those recommended, to establish their rate of delivery.

These considerations have been discussed by a committee of the Technical Society of the Pacific Coast, and the society has authorized its committee to petition the Legislature on the subject. This committee is composed of such well-known engineers as Col. Geo. H. Mendell, Geo. J. Specht, Aug. J. Bowie, Jr., Ross E. Browne, W. R. Eckart and Geo. J. Allardt. The petition asks for the passage of an act looking to the future establishment of the cubic foot as the legal unit of measurement of water, and to this end providing for the appointment of a Commission of Engineers (of which the State Engineer *ex officio* shall be a member), to serve without pay, whose duty it shall be to make experimental tests of one or more forms of gauges for the accurate determination of their discharge of water, and to submit, in writing, to the next Legislature a report embodying the results of such investigations and their recommendations. It is the opinion of the committee that an appropriation of $3,000 will be sufficient to pay the expenses of the investigations and the necessary experiments. The matter is a highly important one, too long overlooked, and it is to be hoped that the Legislature will comply readily with the request as above set forth.

THE vaults at the Sub-Treasury of San Francisco are taxed to the fullest capacity.

Utilization of a New Mineral Substance.

A company has recently been organized in this city, and erected extensive factories at Shell Mound, on the line of the C. P. R. R., for the purpose of manufacturing a material which possesses several peculiar characteristics, the basis being a mineral substance found in this State, but hitherto not utilized. This substance has the appearance of mineral pitch, but possesses rather the characteristics of rubber. It is not at all like asphaltum or coal tar. It is black in color and elastic in texture. Treated by a special process and mixed with a suitable solvent, it is converted into a liquid and can be applied with a brush. In this manufactured condition it is called "paraffine paint," under which name it is sold.

Its peculiar characteristics are such that it is applied for several different purposes. It does not oxidize, is untouched by acids or alkalines, is elastic, waterproof, and to some degree resists the action of heat. The material is applied cold, like any ordinary paint, and when dry does not rub off, and there is no odor to it.

An important use for this is in painting iron or tin for roofing or other uses. It seems to go into the pores of the iron, and does not scrape off, as ordinary paint is apt to do. The roof of the C. P. R. R. depot at Oakland mole has been painted with this substance. There is no corrosive action. Even rusty iron, like stove-pipes, etc., painted with it appear as if japanned, and farther rusting is stopped. The mineral itself is deposited, the solvent evaporating.

Applied to such substances as bricks, it penetrates in such a manner as to enter the pores and prevent absorption of water. This is good for foundation work. Submerged timbers coated with it are also preserved. At the Oakland ferry slip, timbers painted with it three years ago are in a good state of preservation.

Rigging, ropes, fishing lines, etc., coated with this substance are waterproof, so they will wear longer. Applied to canvas for tarpaulins, etc., one coat waterproofs it without stiffening or injuring the fabric in the least. A paper bag painted on the inside will hold water for an indefinite period.

A roofing is made from burlaps soaked in this paint, which is perfectly water-tight. It is made in rolls and is tacked on, and is very useful for temporary structures, etc. Small sheets of this, with the joints painted with the same paint, are also made for roofing purposes. The simple paint alone on tin or iron roofs prevents decay.

The most curious feature of this substance is its applicability to leather. It renders boots, shoes, gloves, etc., waterproof, while they are at the same time pliable, and can be used for belting, harness, etc., as well. The rubber gloves and hoots used in acid factories, etc., wear out in a few weeks, but when made of leather covered with this paraffine paint they have lasted several months. Experiments with all acids and alkalines have so far failed to find one which will affect this paint. The plumbers are using it in soil pipes, to prevent the action of ammonic.

The paint does not seem to injure fabric, metal or wood in any way, but rather preserves it. Experiments were made for several years before the company was organized, and since the factory was started large quantities have been sold. In addition to the C. P. R. R. using it in various ways, the new Selby smelting works roofs are being painted with it, the California powder works, etc. A number of leading citizens are interested in the company, among the directors being W. T. Garratt, J. B. Randol and Joseph Powning. Among others interested are Joseph Eastland, Col. G. H. Mendell and E. B. Dean. The office of the company is at 310 California street. Large quantities of the paint have been made, and the factory adds one more to the increasing home industries of the State.

THE Supreme Court has granted the writ of prohibition prayed for in the case of the Chollar Mining Company vs. Wilson, Judge. It is held that "a majority of the stockholders" and "the holders of the majority stock" is the same thing. Both are used in the act. This is held to be decisive of the cause. The argument as to results is entitled to little weight. The suit was originally brought to prevent any change in the officers of the company.

The Wood River Mining Region.

We had a conversation this week with L. A. Dithmer, of Bellevne, Wood River, who has been engaged in miniug there since 1879. From him we gather the following facts concerning the mineral resources of the region:

The Wood River mining region is situated in Alturas county, Idaho, and extends from the Wood River hottom and Camas Prairis north about 40 miles, and about 25 miles east and west of Wood River.

Mineral has heen known to exist in this section since 1863, hut owing to its isolated position, and being an Indian country, and galena ores not being at that time considered of much value, no attentien was paid to it until 1879, the year follewing ths Bannock war, whsn several prospecting parties entered this then wild country. A number of claims were located that year, but owing to ths difficulty of obtaining supplies, very little work was done, and but few remained throngh the followiug wintsr. The news that rich ores had been discovered, soon spread, and the spring of 1880 saw a great rush to this newly found El Dorado. During that year most of the richest miues now being worked were located.

The geologicel formation of thie section is limestone and granite; the mines are principally galena ledges.

Tho galena mines lie on three helts, divided hy a granitc dyke of from one to threo miles in width. They follow the contact of the formation, and are, with hut few exceptions, found in tho limestone formation. The course of these leeds varies from an eaeterly and westerly to a southeasterly aud northwesterly direction, with a dip to the southward, and the outcroppings can he followed for miles.

The orc in the Wood River mines, unlike that in the Utah and Nevada galena miues, is in continuous veins, like those of Colorado near Georgetown. The galena contaius gray copper, and assaye very high. The ores shipped will average 150 ounces of silver, 70 per cent lead, to the ton, but ee greater depth is reached the ore contains more gray copper and grows richer.

Minerel Hill District, iu the lower helt, ie the first we rcach going into the Wood River region on the Wood River branch of the Oregon Short Line Railroad.

The road runs through Bellevue, a town with a city charter and a population of 2,000 souls. About one mile west of Bellevue, on the west side of Wood River, is the town of Broadford, a mining town with a populetion of 800. Five miles north of Bellevue hy railroad ie the town of Hailey, the county eeat of Alturas county, with 1,500 population, and seven miles west of Heiley by wagon road ie the mining town of Bullion, with 800 population. These are the headquarters and supply stations of Mineral Hill District, that has so far got the greatest number of developed mines, and exteuds from about six miles southeast of Bellevue 20 miles in a northwesterly direction.

About 15 milee north of this district we come to Warm Spring Creek District, with the town of Ketchum, the terminus of the Wood River branch of the Oregon Short Line, and a population of 1,200. The mines here extend ahout eight miles in a southeaeterly direction, taking in the east fork of Wood River, and ahout 12 miles in an casterly direction up Warm Spring creek. The mines and the country formation correspond with those of Mineral Hill District, and ie next to that the most important mining district iu thc Wood River region.

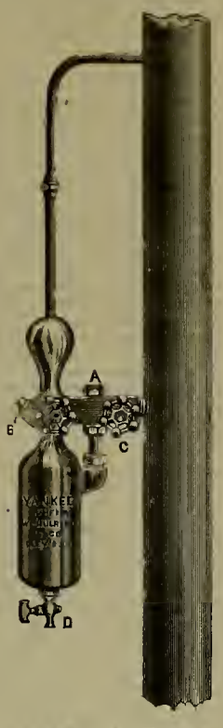
Ahout 20 milee north of Ketchum at the head of Wood River is situated the town of Galena, in the Wood River District, where are located a numher of good mines and prospects.

Ahout 20 miles west of Ketchum and 25 miles northwest of Bellevue is the Smoky Mining District. The ledgee here are large and well defined; the ore is of a high grade galena intermixed with gray copper, and will go from 100 to 500 ounces in silver per ton, and from 30 to 70 per cent in lead. The country formation is lime and granite. Placer mines have also heen worked here for years with good reults.

North of Smoky, and west of Wood River district ie the Sawtooth district. The mines here are silver hearing quartz ledges; the ore is of a high grade, and is reduced on the ground. The country formation is granite. The towns of Sawtooth and Vienna, each with 300 to 400 inhabitants are the headquarters of this district.

Twenty miles east of Bellevue by wagon road is the Little Wood River district, with the town of Muldoon as supply station. The ledges here are also lergo and well defined, the ore is galena end carbonate, the country formation limo and granite. The Weod River mines can be worked cheaply, the ground is favorable, drifting and sinking can be done for from $5 to $10 per foot. Wood and water is ahundant; plenty of the best grass grows everewhere for stock.

Camas Prairie and the Wood River velley have got the best of agricultural lend to raise



THE "YANKEE" SIGHT-FEED CYLINDER LUBRICATOR.

everything the market requires. Good wagon roade counect all the district with railroad communication, at Bellevue, Hailey and Ketchum. Ahout $3,000,000 worth of ore wae shipped from the Wood River country during the year of 1883, and ahout $4,000,000 or $5,000,000 worth in 1884. The greater portion of this ore is shipped to Omaha, a distance of ahout 1,400 miles hy rail. The ore shipped is pure. Any ore containing waste is concentrated at the mines at a cost of ahout $1 per ton. Most mines have their own concentrator and can work low grade ore to a profit that formerly was considered worthless.

The permanence of the Wood River mining region is now estahlished heyond a doubt, though developments are only in their infancy. Many prospects, which show as well as did any of those now developed, are lying idle, waiting for capitel to develop them. They can he secured now at nominal figures. All mines were once hut prospects, and hut a very limited numher of the prospects in Wood River have heen at all developed, and those that have heen which showed ore at the top, have grown richer as the work of development has proceeded.

The "Yankee" Lubricator.

The accompanying engraving represents the "Yankee" light-feed luhricator, for locomotive and stationary engines and machinery of all descriptions. The device is quite simple in construction, and heing of one solid piece of metal, has no joints to leak and cause trouhle.

It hae no internal tuhes to become clogged with sediment and render it irregular in its action. Its feed is regular, and can he gauged to as many drope per minute as may he required, and which are plainly shown in the glass.

Each cup is put up under our own personal supervision, and suhjected to 200 pounds cold water preseure hefore leaving the works. The nut *B* is taken off and its oil is filled in, wheu the nut is ecrewed on again. The valve *C* regulates the drop in the glass. H. P. Gregory & Co., of this city, are the sole agents for this coast for this lubricator.

An Improved Step-Ladder.

The engraving accompanying this represents an improved step-ladder, just patented through the MINING AND SCIENTIFIC PRESS Patent Agency by Layton S. Tibbals, of Mission San Jose, Alameda county. As will be seen, the bracing is quite peculiar, so the legs are kept separated when in use, but may fold togetber readily when being transported. This makes the ladder very safe to use.

The step portion of the ladder is made in the usual wey, the folding legs being suitably hinged at ths tep. The braces or brace-legs, *b b*, cousist of two parallel strips, preferably connected together as shown. The tops of these braces are hevcled te the angle of the inclination of the sides of the front portion, as shown at *a*, whereby they are adapted to he close thereto, and they are connected with these sides by links pivoted to both hraces and sides. The distance between ths pivot points of the links is snch that when moved upward to and heyond a horizontal position they throw the braces less away from the sides; hut when the hraces are in close contact with the sides, the links lie parallel with and alongside of the breoes.

The lower ends of the hraces are heveled to lie flat upon the floor, and the lower ends of the legs are hinged to the hraces, as shown at *c*, in such a manner as to ellow both pairs of legs to fold towards and lie parallel with the front, while at the same time the legs are furnished with support hy thc hraces when opened, es shown. Tbe hinge Mr. Tihhal prefers to use consists of a bracket secured to the hraces and having pivoted hetween its ears an arm or strap which is secured to the legs. This forms a simple and strong hinge connectiou, the further advantsge of which lies in its ready applicability to any etep-ladder.

The braces, with the hinge or links attached, may be made in qnautity and sold, for the application hy the owner himself to his ladder, the only adjustment required heing the shortening of the legs and the attachment by ecrews or holts of the liuks and arms of the hinge to their respective parts.

When the ledder is opeued out for use the weight ie mainly directed downward against the tops of the hraces, which, by lying close to the sides of the front, are in position to resist the strain, and cannot yield without moving away from the bearings, which they cannot do against their links, and the strain or weight exerted downwardly through the legs.

As the person using the ladder descends, he

TIBBAL'S IMPROVED STEP LADDER.

presses with his thumbs against the tops of the braces, aud throws them hackward and upward away from these bearings, whereby tho two paire of legs ean he folded against tbc front. For farther information the inventor can he addressed as ahove.

OIL AND GAS NEAR THE CANADIAN PACIFIC RAILWAY.—Telegraphic reports announce the discovery of natural gas and oil in Manitoba, and directly upon the line of the Canada railroad. The find also indicates the existence of coal in the near vicinity. It ie more than prohahle that the discovery may he an important one.

Future Production of Gold and Silver.

As affecting questions of finance, it becomes a matter of interest to know in what proportions gold and silver are in these western countries likely to he produced in the future. Of course, the factors that enter into this problem are more or less speculative; yet it is legitimate to discuss the question accordiug to the best lights before us. Iu tbe first place, then, we ere of the opiuion that a small, but steady increase in the gold product of Californiu may for some years be counted upon. But, while this is likely to occur in California, we cannot see where else on the North American continent, a similar result can reasonahly he looked for, unless, perhaps, Alaska may yield more of this metal than is just now expected. It was thought tbat Dakota would have increased instead of diminishing her output of this metal last year. But, it looks now as if that Territory may have about reached her extreme limit of gold production. Now, after leaving out California and Dakota, the gold product of all our other Pacific States and Territories is comparatively small—less thau nine millions, all told. Obviously, then, the production of gold is not now keeping pace with the development of our other material intcrests, nor is it likely to do so hereafter, even though fostered and encouraged by all legitimate means.

The production of silver, however, though it has not undergone any marked enlargement during the past few years, is destined to see a more rapid growth; and if uot interfered with hy a suspension or curtailment of its coinage, promises to increase at about the same rate as other great staples aud the general busiuees of the country.

Mexico, which produces but little gold, has during the past teu years turned out annually about $23,000,000 in silver, which amount will hereafter be largely added to. But as such increase will hardly more than meet tbe growiug husiness wants of thet country, it will not add much to our own stock of that metal.

As regards lead and copper, they are commodities so reguleted by the law of demand aud supply, that their production, whether large or small, nced not be considered in connectiou with questions of finance or economy. Just now there seems to have beeu an over-production of these metals, more haviug been made thau the market can absorh at living prices to the producers. For the present the output must stop about where it is, and tbere remain until such time as a reduction of stocks on hand, the growth of other industries, supplemented, perhaps, by the finding of new uses for these metals, shall make a further increase possihle.

Sierra County Mines.

Very encouraging news has been received from the Bald Mountain Extension mine, in Sierra county, this week. From a private letter we learn that the incline will he in working order this week. A few men have already resumed working. Everywhere the bed rock is level and gravel equally wet, averaging from $4 to $5 per carload—a sure indicatien of an immense body of gravel and the richness signifies that they are now iu a wide beud of the channel followiug it up the ridge through the center of the ground. After the 1st of February there will not be an idle man willing or able to work, iu Forest City, whose people are in a fever of excitement and enthusiasm over the prosperous future now assured for their enterprising towu. All this will give a fresh impetus to prospecting for miles and miles up the ridge to the rich quartz ledges the mother of gold—in and around the Sierra Buttes. The Rainhow Company expressed below the other day $3,000, extracted from their late rich ledge extension. The Ruby Company are employing all the men they can obtain, and the Bald Mountaiu Company are dowu 125 feet, with their incline under the lava flow that cut the channel above, and in hard, blue-colored gravel, very rich in gold. The truth of the old saying, "It never rains but it nours," seems to be verified by these encouraging developments of the mineral resources of old Sierra.

From present prospects the Rainhow miue, at Alleghany (Sierra county), will soon bo proved valuahle property, as gold-heariug quar z has been found in the tunnel, 500 feet helow where the ledge was last worked, and of of a similar character as that above, proving it to be an extension of the pay chimney. This county has innumerable rich ledges undeveloped, only awaiting the assistance of capital to make them the most lucrative investments in the State.

Arizona Copper.

The Copper Queen is one of Arizona's most noted and most productive copper mines. The mine turned out in 1884, 7,500,000 pounds of copper, but no gold, silver or lead. During the same time they reduced 30,000 tons of ore. They employ on the mines and works about 175 men, at wages of $3.50 per day. From the report of the company for the fiscal year ending in April last, we find that the average yield of ore in black copper was 13.45 per cent; and average yield of refined copper was 96½ per cent. The company now has a contract for hauling coke, copper, etc., between Bodie and Fairbanks, at the rate of $725 per ton each way, a reduction of 45 cents from the previous year's rates.

The following summary of operations for the year ending March 31, 1884, will give a good idea of production, cost, etc., at this representative mine.

ORE.	Tons.
On hand April 1, 1883	414
Mined during year	33,961
Smelted during year	33,940
On hand April 1st	435
COKE.	
On hand April 1, 1883	97
Received during year	6,368
Consumed during year	6,382
On hand April 1, 1884	83
WOOD.	Cords.
On hand and received	3,792
Consumed in year	3,616

The 33.940 tons of ore smelted during the fiscal year yielded an average of 11.26 per cent in black copper, and produced 7,647,488 pounds, 96.3 per cent fine.

The net New York value of bullion produced was $1,033,045; total of operating, freight, refining and administration expenses, $690,099; net profits, $342,946, which, with the surplus added April 1, 1883, leaves $609,974 profit. Out of this dividends to the amount of $450,000 were paid, leaving a balance of $159,974.

A resume of the business of the company from April 2, 1881, to April 15, 1884, shows the following:

Value of product	1881–1882	$1,020,859.72
Value of product	1882–1883	1,314,973.25
Value of product	1883–1884	1,033,045.62
Total		$3,368,878.59
Expenses	1881–1882	$532,733.33
Expenses	1882–1883	761,071.13
Expenses	1883–1884	690,099.55
Total		$1,983,904.01

Deducting these expenses shows the net earnings for these years to have been $1,384,974.58. From this the company paid $300,000 in dividends in 1881–1882, $475,000 in 1882–1883, and $450,000 in 1883–1884, a total of $1,225,000, leaving a surplus of $159,974.

Referring to this subject, the *Engineering Journal* says:

In examiniug the reports of different Arizona mines, such as the Copper Queen, the Old Dominion and the Arizona Copper Company (formerly Longfellow), we feel justified in saying that every pound of copper laid down here does not cost them more than from 8½ to 9½ cents—probably less—although they have to pay ridiculously high prices for coke and heavy freight on their shipments of copper. For instance, the Old Dominion Company pays about $60 a ton for coke; uses one ton of coke to the ton of black copper—equal to three cents on each pound of fine copper. If a railroad branch should be built to Globs, coke could be delivered at perhaps from $20 to $25, causing a saving of from one and three-fourths to two cents per pound of copper, and the cost of copper would further be reduced by similar freight reductions on the copper material. Evidently the Arizona mines are in shape to compete effectively with the Lake Superior and foreign mines, and even to beat them. Their ores require only one process to make black copper of about 97½ per cent copper contents. How long this cheap production will go on depends entirely on the ore reserves and the quantity of deposits of carbonates in this region. Searching for such pockets is, of course, a very expensive job.

Park City Ore Shipments.

The shipments of ore from the two samplers, (Mackintosh's and the Crescent) for the year 1884 amounted to 35,824,771 pounds, or nearly 18,000 tons. These shipments have been made principally from the Crescent, Ontario, Daly's, Sampson and the Apex mines. The amounts from each being in the order of the list, the Crescent being the largest shipper. The prospects are that the shipments for 1885 will be fully double if not treble this amount, as Daly's mine did not ship any great amount of ore until the latter part of the year, and from present indications it will in all probability be the largest shipper during the coming year. The average price of the ore shipped was about $60 per ton, making over $1,074,720 worth of ore shipped, and this we consider a very low valuation. Besides this enormous amount of ore shipped we have in addition some 20 tons of ore from the Ontario that is worked at the mill and converted into bullion. This ore will averags in the neighborhood of $95 per ton, making a grand total of about $2,974,720 worth of ore mined in this camp.—*Park Mining Record.*

Preparation of Pure Silver.*

Dissolve the thoroughly washed chloride from the humid assays, or from the parting acid treated with salt or hydrocbloric acid, in warm, strong brine of common salt. Filter the solution into a porcelain or glass dish (a wash-basin will serve.) In the middle of the dish place a smaller porous vessel containing salt brine, with a very little nitric acid. (For a porous vessel a bessian crucible, which has stood full of water until soaked through, will answer.) Cut a piece of sheet copper of such a size as to form a cylinder, which can be placed in the porous vessel, not touching the side. From one edge of the copper cut a narrow strip, but not entirely off, leaving it connected to the sheet. Take a strip of test silver long enough to form a ring around, but not touching the porous vessel, and from the edge cut a strip partly off, as with the copper. Clean the copper by immersion a for few minutes in dilute nitric acid and then in water. Connect the copper and the silver by soldering the ends of the strips or by folding them together. Bend the plates suitably, and place the copper in the porous vessel, the silver in the basin containing the solution of silver chloride, the connecting strips forming an arch above the liquids. Keep the whole warm, and if necessary renew the solution in the porous vessel, or add a little acid from time to time.

Pure silver, in the form of small white crystals, will be disposited on the silver plate. Iron or zinc in the porous cell would work faster than copper, but would not give pure silver, as they would cause the precipitation of any trace of lead, copper, etc., which might be present, as well as of the silver. If pure silver for a plate cannot be had, a piece of coke may be used instead, being connected with the copper by means of a copper wire soldered to that, and wound around a notch cut in the coke above the liquid.

The precipitated silver should be washed, first with hot water containing some salt and a *little* hydrochloric acid, and then with pure hot water until that gives no precipitate on addition of solution of silver nitrate. If destined to be melted, the silver may be dried by evaporation after draining; otherwise it should be first pressed between sheets of filter paper, and then dried by heat, and kept in a stoppered bottle.

The dried silver may be melted in a clean, black-lead pot, or in a clay crucible lined with charcoal, a little borax being added, and cast into narrow bars like those of solder. The bars may be cut into chips by the chisel or laminated by the rolling mill, after being reduced to a thickness of about one-fourth inch by hammer and anvil, being cut into suitable lengths, and annealed whenever necessary for the rolling. The filter through which the solution of silver chloride in brine was passed may be dried, dressed with litharge and borax, smelted in a crucible, and the resulting lead button cupelled for recovery of gold. To line a crucible with charcoal, beat in, little by little, finely ground and slightly moistened charcoal until the pot is filled; then scoop out the central portion, leaving a lining about half an inch thick, more or less. Smooth the interior by means of a glass rod or a test-tube.

—From Aaron's Assaying, now in press, published by Dewey & Co. Price $2.

Fineness of Sierra County Gravel Gold.

The following table shows the fineness of gold in various parts of Sierra county, California:

Alleghany	900
American Hill	935 to 950
Bald Mountain	915 to 959
Balsam Flat	880
Canyon Creek	880
Cedar Grove	930
Chaparral Hill	905
Chipps' Flat	880
City of Six	900
Chandlerville	920 to 940
Cold Canyon	918
Craycroft	880
Deadwood	840
Downieville	885
Eureka	840 to 905
Excelsior	905
Feather River	870
Fir Cap	828
Forest City	900
French Ravine	800
Gibsonville	900 to 936
Hepsidam	900
Hopkins' Creek	915
Howland Flat	900 to 909 to 919
Kanaka Creek	860
Ladies' Canyon	884
Middle Yuba	874
Monte Cristo	905
Minnesota	880
Near Sierra Buttes	920
Nebraska (blue lead)	935
Nelson	887 to 605
Oregon Creek	830
Poker Flat	800
Pine Grove	920
Potosi	912 to 919
Poorman	910
Port Wine	935
Ravines near Laporte	900
Richmond Hill	910
Rock Creek	900
Sawpit Flat	910
Slate Creek	900 to 880
Smith's Flat	825
Spanish Ranch	945
St. Louis	900 to 925
Sweet Oil Diggings	875

LEAKS in roofs, about chimneys and elsewhere, may be stopped by thickening white-lead paint with fine, clean sand. Openings are easily filled with this cement and become durably watertight.

The San Juan Country.

Of San Juan county the local papers look with much satisfaction on the output of the year. The Silverton *Miner* says a vast amount of dead work has been done with splendid results, and a number of properties placed in position to eclipse all past performances in the way of production. The entire district has been subjected to numerous and serious drawbacks, but in the face of everything the showing is a much better one than was presented at the close of 1883. During the early part of the past year the fall of snow was almost continuous, rendering inaccessible until late in the fall sections that would otherwise have received attention and development. The most direct inconvenience resulting from the washouts was the failure of a number of companies to resume operations, the agents of which had stated that work was to be resumed. These several drawbacks not only interfered with outside parties coming in, but had a very depressing effect upon those who were on the ground and contemplated extensive development. Instead of the extensive operations contemplated early in the year, very little beyond the necessary amount of work requisite to hold a claim was done. The comparative stagnant condition of the mining industry extended to all other branches of business, and as far as the number and amount of transactions are concerned, the year has been disappointing. What development has been done, however, has been of the most satisfactory nature, and although the actual production of the county was greater than the year before, the inactivity in tributary camps situated in adjoining counties was such that the business here was very sensibly affected. A resume of the past year's operations, to be complete, would necessitate the description of the work done on over one hundred properties that have received more or less attention during the twelve months just closed, but this is out of the question.

English Bullion Market.

The private circular of Mocatta & Goldschmidt, of London, reviews the market in England for silver and gold for 1884. At the close of 1883, silver 925 fine was quoted at 51d. In January, the price fell to 50⅞d, but on the 22d of February it had advanced to 51⅜d, the highest figure for the year. It kept at 50d and upwards until October, when it fell to 49½d, the lowest for the year. The average for 1884 was 50 11–16d, against 50 9–16d in 1883. The sources of supply were the United States, Mexico and South America. The imports from the United States were less than in 1883, but more was received from Mexico and South America. The movements in both silver and gold for the year compare as follows:

	Silver.		Gold.	
	Imports.	Exports.	Imports.	Exports.
1877..	£20,000,000	£19,000,000	£15,000,000	£20,000,000
1878..	11,000,000	11,250,000	21,000,000	14,000,000
1879..	10,500,000	11,000,000	13,250,000	16,500,000
1880..	6,500,000	7,250,000	9,000,000	11,500,000
1881..	9,700,000	7,000,000	10,000,000	15,500,000
1882..	9,100,000	8,950,000	14,350,000	12,100,000
1883..	9,300,000	8,700,000	7,700,000	9,525,000
1884..	9,535,000	9,720,000	10,870,000	11,725,000

In the first two months of the year Spain, Egypt and South America drew heavily on the gold supply of England, but the loss was made good by free imports from America in March, April and May. Later on an outward movement set in, and much of that received in the spring and summer months was lost. An anomalous condition of things was the import of only £740,000 in gold from Australia, while £900,000 in sovereigns was sent to Australia. India took £1,400,000 in fine bars. The imports from South Africa were £430,000, against only £170,000 in 1883.

UTAH SILVER.—The year 1884 shows that there has been a falling off in the value of lead extracted from the mines of Utah, as compared with 1883, there has been an increase in the yield of silver of nearly or quite $1,000,000. Thus, while the agriculture of the Territory has not been profitable as a whole, mining has kept business on an even keel, and saved the Territory from what, without it, would have been a year of disaster. In all human probability, two more great producing mines are about to be added to Utah's list. In the 80 mining districts of the Territory hardly anything is being done except in six or eight of them. The remaining are waiting for the nerve and the capital which will storm their stubborn hills and compel them to give up their treasures.

The great hope of the Territory lies in its mines and the manufactures which should be established.

SOME NEW SILVER MINES.—Late important discoveries are reported by a party of prospectors in the old Waucoba District, Inyo county. The ore is silver-lead, closely allied to that of Cerro Gordo, and the mines are considered to be on the same belt. A series of assays made at the Elna furnace shows an average of 144 ounces silver per ton and 59 per cent lead. The mines are entirely new discoveries and unopened as yet, which may be counted a very decided advantage in that country. The ledges are large and long, in a formation most favorable for extensive deposits. The country is well wooded and watered, and distant from the C. & C. railroad about 40 miles, via a passable road across the Inyo mountains. As usual, the owners are financially unable to put up smelting works, and parties on the lookout for such investments might do well to investigate the new find.—*Bodie Free Press.*

Colorado Coal.

Three years ago it was known that coal existed here in great abundance, but none of it had ever been mined. At that time we were glad to get in and out of here in stages, wagons, on foot or any way that we could. As to the result of the change in these years we will give you below the figures to show the amount of coal and coke mined and shipped at this place.

The Coal shipments from crested Butte for the year ending December 31, 1884, are as follows:

Monthly shipments	Coke tons	Bituminous tons	Anthracite tons
January	1,280	2,440	2,720
February	110	110	620
March	30	1,870	240
April	40	2,800	——
May	800	2,220	——
June	670	2,020	40
July	1,280	2,190	60
August	1,660	3,150	530
September	1,840	3,340	2,600
October	2,020	3,380	3,110
November	2,260	3,670	3,980
December	2,700	3,060	3,630
Total shipment	16,790	30,220	17,550

It will be remembered that we had a terrible explosion here last January, and this coupled with the severe winter is the reason that the shipments were so light last spring. In fact the Antbracite mine was shut down entirely for six months of the year.

Recapitulation.

	Tons.
Anthracite coal	17,550
Bituminous	30,220
Coke	16,790
Precious mineral	1,070
Total	65630

In order to remove this amount of freight it requires 6,563 cars, which was an average of eighteen cars per day for every day in the year. During the last two or three months the car load shipment has averaged 33 cars per day for every day in the month. If that ratio could be kept up the year round it would very near double the present year's shipment, and this ratio would be kept up if it were not for the severe weather and unforeseen accidents.

Last year there was shipped from Pennsylvania to the Missouri river and west, nearly one million tons of anthracite coal. This year we supply 17,500 tons of this amount, and what would it be if we supplied even the half of this amount, which we ought to do?

Silver in Georgia.

A New York *Tribune's* special from Spring Lake, Ga, says: The late discovery of huge veins has now been supplemented by the discovery of silver in wonderful yield. There is great excitement in that section, and men are flocking there from all parts of the country. The most valuable deposits yet known are on the land of Mr. Tyler. A shaft 6 feet deep, 4 wide and 20 long has been sunk under the superintendence of an old miner. The vein is at least 1,500 feet wide, 300 deep and 28 miles long, being the same now worked at Ducktown, Tenn. Here ore was found 5 feet from the surface as rich as that obtained at 200 feet on the famous Comstock lode of Nevada, assaying from $50 to $2,000 per ton, and said to be more advantageously situated than any mine in the West. It will drain itself to a depth of 600 feet, and has a water supply sufficient to operate 10 smelter stacks and all the other machinery necessary. A railroad will be constructed to it from Tilton, a distance of 20 miles. It is said that ore assaying only $4 per ton could be worked with a greater profit than $10 ore in the West. Several large companies have sent their agents to see this mine, and only a few days ago a Pennsylvania company offered Tyler, Gilbert & Rose, the present owners of the mine, $28,000, which was refused.

DEFECTIVE MINING LAWS.—Our mining laws are so framed as to retard the development of the country. The power to make any number of locations, and the holding of the ground for the second year after the location is made, is a drawback that does not seem to be realized by our law makers. The opportunity of relocating ground is an incentive for many men to do nothing upon their claims in the way of development, and they are enabled to hold ground for a term of years without doing a lick of work upon it. In a large number of cases the assessment work, if done at all, is performed upon some part of the claim where there is no ledge and no showing to justify the work being done at that particular place, except it be the fact that the nature of the ground admits of the work being done without much labor and at small cost to the owner. One of the great disadvantages of doing work in this way lies in the fact that such work does not enhance the value of the claim or tend to stimulate mining. If prospectors and miners intend to risk their money and labor in doing assessment work upon mining claims, let the work be done where it will do the most good, and in all cases it should be done upon the ledge, without any regard for the hardness of the rock or the inability of sinking a stated number of feet for $100.—*Tombstone Record.*

ENGINEERING NOTES.

CREEPING OF RAILS.—At the last meeting of the Engineers' Club, held at Washington University, Mr. J. B. Johnson read a paper on the "Creeping of Rails on the St. Louis Bridge." Mr. Johnson said that on the St. Louis bridge proper the rails had been known to creep 200 ft. in one year, and on the bridge approach 400 ft. This creeping varied with the amount of traffic or with the weight carried over the rails. On the St. Louis bridge the rails crept in the direction with traffic. These rails were supported from their base. The reason given by Mr. Johnson for the creeping was that the rail, being held fast on the extended ties, is caused to measure its length across the bridge on its extended flange whenever a heavy weight passing over it caused a wave in the rail. This wave has been known to raise the rail between the two trucks of a car ¾ in., and the creeping has been measured and at times has amounted to ½ in. to ⅞ in. If the rail is supported at one place above its neutral axis, the creeping will be opposite in direction to the traffic. This Mr. Johnson demonstrates satisfactorily with a circular track of hickory. There must be some intermediate point, Mr. Johnson argued, at which the rail would have no desire to creep.

A WONDERFUL ADVANCE IN NAVAL ARCHITECTURE.—Forty-five years ago the Britannia was considered a remarkable ship. She was 207 feet long and her tonnage 1,155. The new Cunarder, the Etruria, is 520 feet long and her tonnage nearly 8,000. The Britannia had engines of 850 horse-power; the horse-power of the Etrurio is 14,000. The Britannia carried 220 tons of cargo and 120 passengers; the Etrurio 5,000 tons of cargo and 1,500 passengers. The Britannia carried 500 tons of coal and her speed was 8½ knots per hour; the Etruria carries 2,500 tons and makes 19 knots per hour. Five years ago the Arizona made the passage in seven days and seven hours. The builder of the Etruria says she will do it in one day less, and in another five years it will be done in five days.

A LIFTING DRAWBRIDGE FOR THE THAMES.—Horace Jones, architect to the corporation of London, has designed a novel bridge to be constructed across the Thames below London Bridge. It will be 880 feet in length, and cost $4,000,000. The waterway will be obstructed by two piers only, leaving a clear way of 200 feet in the center when the draw is open. The piers will be crowned by towers 202 feet in hight, in which will be located machinery for lifting the bed of the bridge to either side for the passing ships and steamers. The two piers are connected by an upper roadway, over which pedestrians can pass when the draw is open, hydraulic lifts being provided for their ascent and descent.

DEFLECTION OF THE MISSISSIPPI.—Captain Eads, who has lately made an inspection of the situation, now declares that within two years the Mississippi is likely to be deflected from its present course past New Orleans down the Atchafalaya directly to the Gulf. Only a tough clay bar across Old River intervenes, and that is being rapidly swept out by the current. The *Times-Democrat* calls earnestly upon Congress to do something immediately to avert the disaster to that metropolis, planting interests of southern Louisiana, as well as the commerce of the great river. That paper asserts that an expenditure of only $12,000 to $15,000 is necessary to obviate the more imminent danger.

STEAM ON LONDON TRAMWAYS.—A satisfactory trial has taken place of one of the fifteen steam tramway locomotives now being constructed by Messrs. Merryweather & Sons, of Greenwich, for the North London tramways. These engines have cylinders 7½ inches diameter by 12 inches stroke, and are each capable of drawing three loaded cars at a speed of eight miles per hour, and at a stated working cost of 30 per cent less than horse power. It is expected that the whole of these engines will be running in the course of the next two months.

HOW SUEZ CANAL IS TO BE WIDENED—PARIS, Dec. 15.—According to the Egyptian correspondent of the *Temps*, the scheme adopted by the Suez Canal Commission for the widening of the canal is shortly as follows: Between Port Said and Ismailia it will be made broad enough to allow of two ships passing each other without stopping. From Ismailia to Suez a canal parallel to the present one will be constructed.—*Special to London Times.*

THE CANAL ACROSS IRELAND, as now projected, and recently submitted, will be 127 miles in length, would contain thirty locks, would be 200 feet wide on the surface, 100 feet wide at the bottom, and would allow the passage of a ship from Galway Bay to Kingston in twenty-four to thirty-six hours. Capt. Eads, proposed to build a ship railway which would reduce the time to twelve hours.

A STREET RAILWAY OPERATED BY WATER.—The cable railway at the Giessbach, in Switzerland, is operated by water. On the arrival of a car at the upper station, it is weighted with a sufficient quantity of water from a reservoir, supplied by a spring, to draw up the other car; so that each car alternately acts as a motor at a very small cost.

USEFUL INFORMATION.

Man's Progress Through the Ages.

Geologists, ethnologists, scientists, savants, and learned men of all lands, have had a great deal to say of the different "ages" through which man has passed. For instance, they tell us that we have come down to the present day through the cave-dwelling age, the mound-building age, the stone age, the bronze age, the iron age, to say nothing of the lake-dwelling age, clay-eating age; that finally letters were invented, and then man took a big jump, made parchment, devised ink and pens, and became a gentleman, turning his back forever on mud and acorns as a steady diet, and ignoring holes scooped out of the ground as places of residence. But he had still another step to take before he reached the crowning age of all, to wit:

The Paper Age.

It was necessary for him to learn to transform rags into paper. This he accomplished about 900 A. D., and from that brilliant stroke of human genius we date the Paper Age. Since then all has been easy enough. Books took the lead, newspapers followed, periodicals, magazines and trade journals closed the triumphant march toward complete happiness. Scientists—always short-sighted folk—began to look upon the "Paper Age" as nearing its close. Poor souls! Paper bags and paper boxes made them smile; paper boats, paper barrels and and paper wheels gave them a chill in the dorsal region; paper collars and paper handkerchiefs set them hemming and hawing; paper bottles, paper tea-caddies and paper chimneys created quite a flutter in so-called "scientific circles;" paper timber and paper flooring rendered them rather uneasy; paper shirt fronts and paper slippers broke them down entirely. But the end is not yet. We are in reality only just entering upon the borders, so to speak, of the genuine Paper Age. In a few short years, in our paper shirts and paper trousers, we shall sit down to our paper table upon our paper chairs, drink our coffee out of paper cups, and eat our eggs with paper spoons. When we go out of a morning we shall make ready our paper shoes, paper overcoat, paper gloves, paper umbrella, or paper cane, and paper hat, kiss the baby happy in its paper pinafore, trip lightly down the paper stairway, over the paper sidewalk to our paper carriage, and start down town, stopping at the club for an "eye-opener" out of a paper wine cup, and then continue our noiseless ride over the paper pavement, stopping once more possibly to order the latest paper novelty for our better-half. Oh no, ye wise men, the end of the Paper Age is not yet!—*The Paper World.*

Ammonia Cheaper than Soap.

Ammonia is cheaper than soap and cleans everything it touches. A few drops in a kettle that is hard to clean makes grease and stickiness fade away, and robs the work of all its terrors. Let it stand ten minutes before attempting to scrape off, and every corner will be clean. It cleans the sink and penetrates into the drain-pipe. Spots, finger marks on paint disappear under its magical influence, and is equally effective on floor and oilcloth, though it must be used with great care on the latter or it will injure the polish. There is nothing to equal it in cleaning the silverware, and it gives a higher polish and keeps clean longer than anything else. If the silver be only slightly tarnished put two tablespoonfuls of ammonia into a quart of hot water, brush the tarnished articles with it and dry with a chamois. If badly discolored, they may need a little whiting previous to the washing. An old nail brush goes into the cracks to polish and brighten. For fine muslin or delicate lace it is invaluable, as it cleans without rubbing the finest fabrics. Put a few drops into your sponge, bathe in hot weather, and you will be astonished at the result, as it imparts coolness to the skin. Use it to clean hair-brushes, and to wash any hair or feathers to be used for beds or pillows. When employed in anything that is not especially soiled, use the waste water afterward for the house plants that are taken down from their usual position and immersed in the tub of water. Ammonia is a fertilizer, and helps to keep healthy the plant it nourishes. In every way, in fact, ammonia is the housekeeper's friend.

WHITE LABEL PAINT.—A white varnish or paint for painting labels upon glass, wood, or metal, known in Germany as *Cracau's Shilderlack* (Cracau's Label-varnish) is prepared in the following manner: Triturate 150 parts of best zinc white and 3 parts of finely powdered acetate of lead in a warm mortar with a little oil of turpentine, to a uniform mass of consistence of lard; then add gradually, under constant stirring, 20 parts of boiling (not "boiled") linseed oil. Though the resulting mixture has a very dark color, this does not interfere with the uses of the varnish, as it will produce a perfectly white surface. Next, 90 parts of damar varnish (made from 1 part of damar and 2 parts of oil of turpentine), 5 parts of castor oil, and lastly 20 part of copaiba are added, the whole well mixed, and finally diluted with about 100 parts of oil of turpentine. The varnish is transferred to a cylindrical vessel, and set aside for about one week. During this time any coarse grains of zinc white will settle to the bottom. The supernatant liquid and a portion of the sediment (about three-fourths; all but the coarse portion) are poured out, and the varnish or paint is ready for use.—*Pharm Handelsbl.*

CRYSTALLINE COATING FOR WOOD OR PAPER.—Mix a very concentrated solution of salt with dextrin, and lay the thinnest possible coating of the fluid on the surface to be covered by means of a broad, soft brush. After drying, the surface has a beautiful, bright, mother-of-pearl coating, which, in consequence of the dextrin, adheres firmly to paper and wood. The coating may be made adhesive to glass by doing it over with an alcoholic shellac solution. The following salts are mentioned as adapted to produce the most crystalline coating, viz.: Sulphate of magnesia, acetate of soda, and sulphate of tin. Paper must first be sized, otherwise it will absorb the liquid and prevent the formation of crystals. Colored glass thus prepared gives a good effect by transmitted light.

TO CLEAN VARNISH.—Save the tea leaves for a few days, then steep them in a tin pail or pan for half an hour, strain in a sieve and use the tea for all varnished paint. It requires very little elbow polish, as the tea acts as a strong detergent, cleaning the paint from all impurities, and making the varnish equal to new. It cleans window sashes and oil-cloths—indeed any varnished surface is improved by its application. It washes window panes and mirrors much better than water, and is excellent for cleansing black walnut picture and looking-glass frames. It will not do to wash unvarnished paint with it.

FILLING FOR CRACKS.—A very complete filling for open cracks in floors may be made by thoroughly soaking newspapers in paste made of one pound of flour, three quarts of water, and a tablespoonful of alum, thoroughly boiled and mixed. Make the final mixture about as thick as putty, and it will harden like papier mache.

TO MEND CHINA or broken earthenware, take a very thin solution of gum arabic in water and stir into it plaster of Paris until the mixture becomes of the consistency of cream. Apply with a brush to the broken edges of the ware and join together.

GOOD HEALTH.

The Healthfulness of Eating Before Sleeping.

David M. Stone has an interesting article in the Boston *Journal of Commerce* on this subject, from which we quote as follows:

The notion is widely prevalent that it is unhealthy to eat late at night or just before retiring. This came from the severe denunciation of "late suppers" contained in nearly all the works on diet. But it was the midnight debauch that was the object of attack, and even here it was less the gluttony than the drunkenness which alarms the doctors and calls forth their reprehensions. A man may induce apoplexy by gorging himself with food at any hour of the day. Man is the only animal that can be taught to sleep quietly on an empty stomach. The brute creation resent all efforts to coax them to such a violation of the laws of nature. The lion roars in the forest until he has found his prey. The horse will paw all night in the stable, and the pig in the pen, refusing all rest or sleep until they are fed. The animals which chew the cud have their own provision for a late meal just before dropping off to their night slumber.

Man can train himself to the habit of sleeping without a preceding meal, but only after long years of practice. As he comes into the world nature is too strong for him, and he must be fed before he will sleep. A child's stomach is small, and when perfectly filled, if no sickness disturbs it, sleep follows naturally and inevitably. As digestion goes on the stomach begins to empty. A single fold in it will make the little sleeper restless; two will awaken it, and if it is hushed again to repose the nap is short, and three folds put an end to the slumber. Paregoric or other narcotic may close its eyes again, but without other food or some stupefying drug it will not sleep, no matter how healthy it may be. Not even an angel who learned the art of minstrelsy in a celestial choir can sing a babe to sleep on an empty stomach. It is a fact established beyond the possibility of contradiction that sleep aids digestion, and that the process of digestion is conducive to refreshing sleep. It needs no argument to convince us of this natural relation. The drowsiness which always follows a well-ordered meal is itself a testimony of nature to this interdependence. The waste of human life by the neglect of the lesson is very great. The daily wear and tear of the body might be restored more fully than it usually is, if this simple rule was not systematically violated.

BRIGHT'S DISEASE.—Few, I think, are aware of the extent of this disease, of the number of persons who annually die with this malady. I do not wish to run this into a "patent medicine" advertisement, nor will I put Dr. or M. D. to my name, but wish to merely give a few points that may benefit those who may read this. The symptoms of Bright's disease are many, and will develop in almost any part of the body but the kidneys, where usually no pain is felt, and one would not suppose that anything was wrong with their kidneys. One of the most reliable proofs (unless it be with the aid of the microscope) is the following: Take a clean bottle; holding about a pint, fill it with urine and place it in a water bath, i. e., put it in a dish of warm water and bring it to a boil, boiling for one-half hour. If at the end of that time the urine has turned milky, become thickened and somewhat resembling sour milk, you have certainly Bright's disease. I have no pecuniary interest in any of the so-called patent medicines, but whenever we find that they contain the articles that are needed to cure the disease, why not use them? Tramer's Safe Cure, I am sure, will cure this disease if taken in time. Dr. G. Johnson, in an address delivered before the British Medical Association, stated that a patient of his who was 55 years of age, who has lived on a milk diet for five years, took a gallon of milk a day, but not a particle of any other food. This treatment entirely cured him of Bright's disease. T T

Jan. 1, 1885.

Increased Duration of Life.

The stage, in the duration of life to which we have at present attained, may be stated thus: Compared with the period 1838–1854 (the earliest for which there are trustworthy records), the average of a man's life is now 41.9 years instead of 39.9, and of a woman's, 45.3 instead of 41.9 years, an addition of eight per cent to the female life and five per cent to the male. Of each thousand males born at the present day, 44 more will attain the age of 35 than used to be the case previous to 1871. For the whole of life the estimate now is that of 1,000 persons (one-half males and one-half females) 35 survive at the age of 15, 26 at 55, 9 at 65, 3 at 75, and 1 at 85. To put the case in another way, every thousand persons born since 1870 will live about 2,700 years longer than before. In other words, the life of a thousand persons is now equal in duration to that of 1,070 persons previously; and 1,000 births will now keep up the growth of our population as well as 1,070 births used to do. This is equivalent in result to an increase of our population, and in the best form, viz: Not by more births, but by fewer deaths, which means fewer maladies and better health. What is more, nearly 70 per cent of this increase of life takes place (or is lived) in the "useful period," namely, between the ages of 20 and 60. Thus, of the 2,700 additional years lived by each thousand of our population, 70 per cent, or 1,890 years, will be a direct addition to the working power of our people. It is to be remembered that there might be a great addition to the births in a country, with little addition to the national working power—nay, with an actual reduction of the national wealth and prosperity—seeing that, regarded as "economic agents," children are simply a source of expense, and so also are a majority of the elderly, who have passed the age of threescore. On the other hand, as already said, only one quarter of the longer or additional life now enjoyed by our people, is passed in the useless periods of childhood and old age, and more than one-third of it is lived at ages when life is in its highest vigor, and most productive alike of wealth and enjoyment.—*Cornhill Magazine.*

INJURIOUS TO VISION. Railroad traveling is said to be injurious to vision on account of the vibrations, which makes print dance before the eyes, and induces such intent observation as to produce fatigue. It is curious to note the eyes of one's fellow travelers who are looking out of the window during a rapid railway journey. The ever-changing landscape induces an oscillation of the visual organs so incessant and continuous as to be perfectly astonishing. The effect of this exaggerated activity and restlessness may be, perhaps, more fatiguing than the steady perusal of well printed type. It is curious to note how some eyes engaged in looking upon this constantly shifting scene and have momentary pauses in their labor, become motionless, as if staring into vacuity, nature thus snatching a few seconds of much needed rest, both for brain and eyes.

MALARIA.—The latest theory of malaria is that the principal source of the fever and exhaustion is to be sought in the slowly but cumulatively poisonous influence of the relatively large amount of carbonic acid in the atmosphere of malarious districts, generated by vegetable decay, by evaporation of soil moisture laden with it, or by upturning of earth saturated with that compound. Recent measurements of the carbonic acid in the soil, as compared with the amount present in normal atmosphere, have shown that their relative proportions are as 250 to 1.

INGROWING TOE-NAILS.—EDITORS PRESS:—Having seen a notice in a recent number of the PRESS for treating ingrowing toe-nails, please allow me to state a process which I have known to succeed in numerous cases: First, never cut an ingrowing nail, or any other, too close to the flesh. Second, take a little cotton or scrape some lint from an old rag and with the point of your pocket knife press it under so as to raise the nail from the tender flesh. This is a very simple process, but I believe it is not generally known, and I have never seen it fail of accomplishing the purpose. B. B. R.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

MISCELLANEOUS.—*Ledger*, Jan. 26: The Plymouth Con., on the 9th inst., declared its twentieth monthly dividend of 50 cents per share, aggregating $50,000. S. D. R. Stewart keeps 20 stamps of the Lincoln mill running steadily. The rock is soft, and 50 tons per day is easily disposed of. The ore is of low-grade, but leaves a small margin of profit over expenses. The new hoisting works of the South Spring Hill are expected to be in running order some time next week. The mill is kept running to its full capacity. A. M. Randall has leased on shares the gravel claim of A. P. Clough, located within the limits of his garden near Volcano. Hydraulicing was started a few days ago, and some excellent pay dirt was encountered. The lessee is to divide the net proceeds with the owner. J. T. Wheeler's gravel claim at Pine Grove is in full blast again. The first heavy rains caused a bad landslide, which has taken several weeks to overcome. They started washing again Tuesday morning. At the Tellurium the rock on the dump at the time of the fire has been crushed, under the supervision of L. McLaine. It is currently reported that in case the ore yielded an average of $8 per ton, there were parties in Jackson ready to take hold of the property. The cleanup it is said, exceeded expectations, but the exact yield we are not in a position to give. Seven men are at work on the New York quartz mine, located in John Bull gulch, three miles southwest of Jackson. They are sinking a shaft from the tunnel level, which is 70 feet from the surface. There is a large body of low-grade ore, which it is thought will pay if properly treated. The old ditch is being cleaned out, and a furnace will be erected on the ground. The big tunnel at Middle Bar is again in rock of the hardest character.

SUTTER CREEK.—The break in the pump at the Mahoney has been repaired, and has been running satisfactorily for nearly a week. Unless some further mishap occurs, they expect to get the water out in about a week. The pump rod at the Lincoln broke a few days ago, causing a large increase in the water at the Mahoney. A number of men are at work putting in nearly 60 feet of rod. At the same time the shaft will be repaired to some extent.

THE MINING OUTLOOK.—Amador *Dispatch*, Jan. 24: The mines located south of Jackson, near the Mokelumne river, all seem to have taken a fresh boom lately. In addition to the celebrated Nevills mine we learn that rich strikes have been made within the last few days in the Morgan mine, the St. Julien mine, and also the mine owned by John Wetzler & Co. The latter mine, especially, we understand is yielding a fabulous amount of gold every day.

Inyo.

KEYNOT MINE.—Inyo *Independent*, Jan. 24: The proprietor of the Keynot mine, Beveridge district, Mr. L. L. Lasky of Lone Pine, says he wants to push the development of that property with all possible vigor. On the entire claim there are now nine separate openings or mines, and in these Mr. Lasky says 41 men are now at work on the tribute system. He says further a large number of miners could all be put to work on the claim with assurance of making good wages, and he will furnish food, tools and all necessary supplies to good miners, they to pay for the goods out of the proceeds of their labor in the mines. There is a good mill on the claim where ores are worked as fast as mined. A new prospect mill was also completed last week, that will work samples of 50 pounds weight and upward. A road was opened to the mine last week, and Mr. Lasky says he sent over it three and a half tons of groceries and provisions. Tom Bastian and his brother and three other partners are running an air tunnel to an ore chute out of which several hundred tons of ore have been taken that averaged about $100 per ton. The quantity of ore still in this chute is known to be very large, and when the air tunnel shall be finished, and about 100 feet remains to be completed, this ore body will yield large returns to tributers and proprietors. All these statements are made by Mr. Lasky himself, and so far as propositions to miners are concerned, he says he is ready at any time to carry out all that is promised.

ALABAMA HILL.—For several years past a little mining has been done occasionally on rich ground in Alabama Hills, near Lone Pine. The great scarcity of water made the operations very limited, however. Mr. S. Zaun, who owns the principal claim, has lately completely a ditch extending from the main range of the Sierra on to the mining ground. This ditch will supply an abundance of water during about eight months of each year. Mr. Zaun has been very much hindered by want of money to carry on vigorously the work of making this ditch. Patience has at last succeeded, as it rarely fails to do, and now there is a fair prospect of being rewarded for all the time and labor spent.

A NEW TUNNEL.—Last Monday A. C. Harvey and Rube Speer began work on a tunnel to open a mine about one and a half miles from Lone Pine station on the C. & C. railroad. The ledge was first found near the top of a high cliff; here enough work was done to determine the width and direction and the quality of the ore. The tunnel will not have to be run far to strike the ledge, and will give a good depth of backs.

ORE SHIPMENT.—A quantity of ore is now ready for shipment at the Eclipse mine. It will be sent to Selby & Co., San Francisco, and is fine smelting ore.

Nevada.

MUNDIC.—Nevada *Herald*, Jan. 24: At the Wyoming mine a few days since, a nest of what miners call mundic, was discovered. The deposit was not very large, being a portion of that which was taken out some time ago while running a drift. Many pretty specimens were found, of almost solid sulphurets and pyrites, showing the same in a variety of shapes and colors. Some of the pieces sparkle like precious gems. Foreman Peard has our thanks for several specimens.

BULLION.—Foothill *Tidings*, Jan. 24: The Cornucopia and Secret Treasure Mining Company, of Washington township, has made its first shipment of bullion. The ore mills a little $20 to the ton, and $10 a ton will give good profit. The name of the company is too long.

WILLOW VALLEY DISTRICT.—Nevada *Herald*, Jan. 24: Commencing at the upper or eastern end of this district, 4 miles, from Nevada, we first encountered the Federal Loan and Constitution mines parellel locations some 600 ft apart.

FEDERAL LOAN.—This is one of the oldest locations in the disttict, and is situated on the south bank of Deer creek. Country rock, metamorphic slate; course east and west; dip 32 degrees south; size of ledge from a few inches to 4 ft. The mine has been worked in the past to a depth of 100 ft by an incline. Results generally satisfactory, some very rich spots being met with. Present operation have been confined to the sinking of the above incline, which has reached the depth of 180 ft. The late storm caused the breaking in of a neighboring ravine into the mine. This unlooked for event has necessitated running a tunnel some 200 ft in length, to draw the water into a different channel. A night and day shift are engaged in pushing this tunnel rapidly to completion. The hoisting and pumping rig is run by a three-foot hurdy wheel, under a 120-ft pressure. A 10-horse power engine is also a part of the plant and can be attached in short order in case of breakage. A six-inch pump keeps the mine free from water under ordinary circumstances. This mine is well located for economical and profitable working, being situated below and contiguous to the V Flume Lumber Co.'s flume, and also 900 feet distant from the South Yuba Canal Co.'s ditch, from which a pressure of 400 ft can be obtained at the works by a comparatively small out-lay. Operations are being conducted by Wm. Avery, Esq., for Eastern parties.

CONSTITUTION MINE.—This mine, located in the fifties and worked with varying success at different times since, bids fair to become one of the valuable mining properties of this district. The mine has the reputation of being one of the richest sulphuret ledges in the county. The ledge varies in size from 6 inches to 2 ft. Considerable work seems to have been done. The mine is comparatively undeveloped, operations having reached but a short distance below water level, which is the bed of the creek. The facilities for working are equal, if not superior, to any in the county, it being situated almost equi-distant from the South Yuba and Snow Mountain ditches, insuring on either side water power with pressure of hundreds of feet. The present operations are confined to sinking a new shaft about 200 ft south of and across the creek from the old shaft. The ore which has been extracted is very heavily sulphureted and is as fine rock as has been brought to the surface in the district for some time. Like all heavy sulphuret ledges, it has been compelled to lie idle for want of proper facilities, the quartz carrying but little free gold. Rock in former times, although assaying hundreds of dollars per ton, barely paid expenses. In these times, with cheap facilities for extracting and Frue concentrators to save sulphurets, we know of no reason why mines of this character can not be made to yield handsome returns. Maltman, Myers & Co. are the owners.

LECOMPTON.—The Lecompton ledge was located in the spring of 1857, by Geo. Hearst, Geo. D. Roberts and others, and is situated about three miles from Nevada. Over $60,000 clear was taken out in the first year's working. J. J. Ott, of this city, purchased the property in 1893. Up to this time the gross yield was over $220,000, the rock averaging $40 per ton. Ott erected pumping and hoisting machinery on the south bank of Deer creek and sunk an incline to the depth of 175 ft, taking out considerable rock. The ledge varies in thickness from 3 inches to 2½ ft. The high water of 1864 damaged the plant, besides filling up the incline with water. Operations have not been resumed at this point to date. Desultory prospecting has been carried on above the water level, from which some very satisfactory results have been obtained, some of the latest crushings averaging as high as $150 per ton. This mine has equal facilities with those above mentioned for ample and inexpensive power. Country rock, granite; one-half mile east of this mine is the contact of the granite and slate.

RISING SUN.—The Rising Sun, or John Day ledge, is about two miles from Nevada, a short distance above the Oriental mill. Working in the past have been confined mostly above water line. The present lessees have erected neat and compact hoisting and pumping machinery, (propelled by a hurdy wheel under 300 ft pressure), and sunk an incline on the ledge. The late storm caused a greater flow of water than their 8-inch pump could handle and the mine became filled. A 10-inch pump has been put in place and is rapidly clearing the works of water. Trenberth, Hampton & Co. are the managers of this enterprise. Country rock, granite.

DEADWOOD.—Little or nothing is being done at this mine at present. The ledge is in granite and runs north and south, dipping west at an angle of 45 degrees. Some excellent rock was taken from it a few years ago.

NEVERSWEAT.—A ledge of fine sulphuret rock, for which the owners have been offered $200 per ton on the dump, was struck a short time ago. This is an east and west ledge, pitching north, and is worked through an incline. Substantial hoisting works and pumping outfit, propelled by water power, facilitate operations. Lyons, Hampton & Co. are the owners.

HUSSEY MINE.—This is considered by judges to be a good mine, but has been closed down temporarily. The mine is provided with complete hoisting works, the same being run by a 22-ft overshot water wheel.

MONTANA.—An old location which has yielded well in the past, but which has been worked very irregularly for several years. The course of the ledge is east and west, dipping to the north at an angle of 32 degrees. It has been worked to a depth of 300-ft. There are steam power hoisting works.

RICH MINING STRIKE.—Nevada *Herald*, Jan. 24: A streak of unusually rich rock was struck in the bottom of the shaft at the Nevada City mine yesterday, 800 feet from the surface. The quartz is literary filled with gold and is about the richest rock yet discovered in this mine, which is celebrated as a producer of valuable specimens. One box of selected quartz, valued at $2,500, was shipped below, to be sold to the jewelry manufacturers. Another box has been put aside to await orders from San Francisco jewelers. Considerable of rock was thrown into the batteries. It is estimated that the ore already extracted from this rich bunch or pocket, is worth between $3,000 and $4,000. Some of the specimens would go as high as $200,000 per ton.

Plumas.

FOREST KING.—Greenville *Bulletin*, Jan. 24: The owners have been running a tunnel 150 ft below that from which the pay ore was taken last fall. They are running along the side of ledge matter and are within 100 ft of the pay chimney worked previously.

NORTH FORK.—John Ellis, the veteran prospector has returned from a trip to the North Fork country. Ballou & Winters are running a tunnel on their gravel claim and have good prospects of reaching the channel soon. R. C. White & Co. are pushing their tunnel ahead with favorable indications. At Drummond's Point, near Cariboo, three men took out $900 in one day by drifting in a quartz crevice. B. Pazzonia is at Dutch Hill has his tunnel in 700 ft. In seeking the ledge, he crossed a bed of lava 300 ft wide, and the indications are that he will soon break into a channel. His quartz mill is now idle in consequence of cold weather.

LEASED.—E. Ware & Co. have leased the Sunnyside mine from R. L. Hobart. Ore is now being hauled from the Ano mine to the Arcadian mill. Crushing will begin in a day or two. Ellis & Davis will open up what is known as the Abbott tunnel on an extension of the Drury mine near the Forest King. Mr. Ellis informs us that work will begin at once.

Sacramento.

MINES AROUND FOLSOM.—*Telegraph*, Jan. 24: To the casual observer, Folsom does not bear the appearance of a mining town. The days when gold dust circulated as a medium of exchange in the everyday business transactions of buying and selling flour, potatoes, bacon and rubber boots, have long since departed. No longer does the red-shirted miner ride into town on his mustang, with his trouser legs stuffed into his boot tops, a sombrero on his head and a clay pipe in his mouth. Nevertheless our mining days are not gone. Scores of miners are delving away with pick and shovel in this vicinity. Being invited to take a look at some of the claims now being worked in the vicinity of Alder creek, one day this week the writer boarded the noon train for Sacramento and prepared for an afternoon among the gold hunters. Arrived at the creek, which is about three miles distant from Folsom, we proceeded to Mr. Farmer's claim, where we discovered his partner, Charlie Imhoff, busily engaged in running a drift. The mine is situated about 200 yards from the railroad, and is a gravel bank about 12 ft in depth. The gravel is very closely packed, and is exceedingly hard to get out. The gravel is wheeled a short distance to a string of sluices, where it is easily washed. So far, this claim prospects very well, and will undoubtedly pay. A large number of Chinamen with rockers are working here and there among the gravel banks, and appear to be making wages. In this connection we may add that it is a fact to be regretted that many of the very best and largest claims in this neighborhood are owned and worked by Chinese.

San Bernardino.

BISMARCK CAMP.—Calico *Print*, Jan. 25: The shaft on the Bismarck is now down 100 ft and shows a paying ledge nine ft wide. It is in contemplation by the owners to increase their working force by 30 men in a few days, and as little of the work done will be dead work, a largely increased bullion production is confidently expected from this mine. The Exchequer, in the vicinity of the Bismarck, Oriental, Humbug, etc., is showing up large bodies of ore milling over 100 ounces per ton. Work has been suspended for a few days, but will be resumed again shortly with an additional force, and Mr. Brison anticipates being able to demonstrate that he has a mine not second to any of those in the vicinity above named, although everyone of them is now looking better and more promising than at any time since work upon them commenced. There are already over 100 work-men employed in this "ward" of East Calico, and quite a village is springing up, already comprising some twenty-five houses. There are two good hotels there, a store doing a profitable business, and a large saloon is now in course of construction.

LITIGATION.—There is a likelihood of some interesting litigation over the boundaries of some of the Calico mines since their value has been demonstrated by development. Several lawsuits are on the tapis.

ORES.—Several of the chloriders in East Calico are sending their ores to the Waterman mill for reduction. There is a large increase of the number of men at work in that section, as well as of production, and there will be urgent demand for additional milling facilities shortly.

THE tunnel at the foot of the falls on the Sue mine, which has been steadily pushed ahead on two wings, during the past two months, is now in 220 ft on one course and has struck a body of good ore. This tunnel is not less than 1000 ft below the main shaft on the apex of the mountain, which is over 125 ft deep in first-class ore, and there are surface indications where ore has been taken out the whole 1500 ft length of the ledge.

Sierra.

WORK PROGRESSING.—Sierra *Tribune*, Jan. 24: At the Young America mine the work of development goes on with the most encouraging prospects. The low tunnel is in 220 ft, 80, of that distance being on the ledge. The tunnel is still some 60 ft from the shaft where the first prospecting was done. The The average width of the point upon which it is worked at present, better prospects are obtained than at any place previously open out on it. A *Tribune* reporter on Tuesday saw a piece of rock that was taken from the hanging wall of the ledge. The chunk did not weigh over one pound and upon being up in a mortar and "panned" out, yielded a trifle over one dollar in gold. It is the opinion of everybody here who is acquainted with the Young America that it will develop into one of the biggest mines ever opened out in this section.

RUBY MINE.—Encouraging reports come from the Ruby mine. The working force has lately been increased to 30 men, and this number will be added to, as developments are made. The gravel being taken out yielding handsomely. The course of the channel is north. Last week a tunnel was started running west of the present tunnel to prospect for the continuation of the Bald Mountain lead.

Tuolumne.

NOTES.—*Union Democrat*, Jan. 24: C. W. Tozer has bonded the Eagle mine at Blue Gulch, near Jacksonville, and has commenced work to develop the property. The Eagle mine is situated on the mother lode, and is considered by mining men to be a promising property. At the Buchanan operations are being steadily pushed. Over 400 tons of ore lies on the dump ready for crushing, all of it taken out in the necessary work of development. No stopes have been opened as yet. It now seems settled that a mill will be erected in the spring. Operations have been suspended at the Dead Horse mine until the roads get into good condition for hauling. The machinery for the new works is on the ground, but the lumber is lacking. The mine is said to present an exceedingly flattering appearance. W. E. Koch has bonded the Hunter mine, above Summerville, and will take charge of it on the first inst. It is reported that Mr. Leechman of the Soulsby mine will direct operations. Billy Reddy has nearly completed the tunnel into Bonanza Hill. He expects to get into the old workings of the Bonanza mine in a few more days. The pocket miners on Bald Mountain are very busy. Several good pockets have been taken out lately, which of course stimulates exertions. A contract to sink the shaft of the Lamphier mine fifty ft deeper has lately been let. Prospecting in the drifts still continues. Lang & Shaw have hauled the Golden Gate mill over to Groveland, and are going ahead with the work of erection. The Soulsby mine and mill are being steadily operated, and the ore extracted is of very good quality. Long & Hampton are keeping things going at the Williaetta mine, and making regular clean-ups.

NEVADA.

Washoe District.

GOULD AND CURRY.—All work below the Sutro tunnel level has been discontinued, and the tracks, air pipe and the like hoisted out. They are now cutting out a joint station on the 1000 level of the Gould and Curry or Bonner shaft. When completed the Gould and Curry will run a north lateral drift to the Best and Belcher south line, when the latter will continue it through its own ground.

OPHIR.—The water is fast draining out from the old Mexican shaft and the surrounding ground on the 500 level. The north lateral drift on the 500 level is being advanced as rapidly as possible. It is being run along the west wall, and will be continued through the Mexican and Union Con. ground. From the 250 level have shipped to the Morgan mill, from November 26 to January 16, inclusive, 876 tons and 746 pounds of ore, which is now being milled.

HALE AND NORCROSS.—The west cross-cut (No. 2) on the 2800 level is still being advanced in solid quartz, which is metal-bearing and of a most promising appearance in every respect. It is expected that the ore streak found in No. 1 cross-cut will soon be encountered. A drift is now being run from the Chollar main west drift on the 3000 level to connect with the bottom of the main winze. As soon as this connection has been made all will be open to exploration from the 3000 level to the surface.

BEST AND BELCHER.—A bulkhead has been put in at the Osbiston shaft and the pumps stopped. Thus the water is being allowed to plow through of itself into the Sutro tunnel. The track, pipes and other apparatus below the Sutro tunnel level have all been hoisted up.

COMBINATION SHAFT.—The new hydraulic pump on the 3000 level is now running very smoothly and well, thoroughly doing all the work required of it. The main west drift on the 3000 level of the Chollar has been stopped, and a branch drift started directly toward the bottom of the Hale and Norcross winze.

SAVAGE.—The E-street tunnel is now passing through the old stopes, but has not yet reached the point where it is expected that ore will be found.

YELLOW JACKET.—The old upper levels continue to yield a considerable amount of low-grade ore, which is being sent to the mills on the Carson for reduction. Much ore has been opened up ready for extraction, and explorations are still continued at various points.

SIERRA NEVADA.—The mine has been dismanteled below the Sutro tunnel level. Preliminary operations have been commenced on the Cedar Hill in the old Sacramento ground, and eventually work will be started at other points in the same locality.

CROWN POINT.—The usual amount of low-grade ore is being extracted and sent to the mills on the Carson river. A considerable amount of prospecting is being done at various points.

CON. CALIFORNIA AND VIRGINIA.—Good progress is being made in the work of repairing the main drift on the 1550 level, and some preparatory work is being done at other points in the old workings.

MEXICAN.—A drift is being run north from the Ophir, on the 500 level, to prospect the mine at that depth.

BELCHER.—A considerable amount of low-grade ore is still being extracted and shipped to the mills. A good deal of ore that will pay for working is still in sight.

UNION CON.—A drift is being run north from the Ophir on the 500 level which will open up a large area of ground hitherto unexplored.

Cortez District.

LOOKING BRIGHT.—Eureka *Sentinel*, Jan. 20: We are permitted to print the following interesting extract of a letter from H. J. Smith to a citizen of Eureka, concerning his mine in Cortez: "I am happy to inform you that things are looking exceedingly bright in the mine I am working. We have a foot of splendid ore in the lower tunnel, and alongside of it is a large ledge spotted with good ore. This is at a vertical depth of 200 ft. We have passed through a nice body of ore in the upper tunnel, which is at a vertical depth of 150 ft, and we believe we are within 30 ft of another body in this tunnel. All the boys on the hill are doing well."

Dun Glen District.

GOLD.—Reno *Gazette*, Jan. 20: G. McM. Ross has taken up a little gold mine at Dun Glen, Humboldt county, that only runs from $6 to $10 per ton,

and is making $3,000 a month from it. He has a ten-stamp mill and two Frue concentrators. He burns sagebrush for fuel. He has plenty of ore in sight to run for ten years, and there are other mines just as good all around. Mr. Ross thinks the country from the Humboldt House to the Carson Lake is the best mining country in the world.

Eureka District.

LORD BYRON MINE.—Eureka *Sentinel*, Jan. 20: Reuben Rickard, Esq., general manager of the Dunderberg Mining Company, will leave on Friday morning next for London via Denver. To a *Sentinel* reporter yesterday, he stated that a site has been decided on for a new shaft in the Lord Byron mine, and the work will be commenced at an early day. Mr. Rickard has great confidence in the future of Eureka district, and especially in some of the properties belonging to the company he represents.

ADAM'S HILL.—There is considerable activity among the mining men on Adam's Hill. But few if any idle miners are there, and all those working are doing well. The Oriental and Belmont mine, which is worked by Messrs. Ball and Poplin, is shipping about 25 tons of ore every week to the Richmond furnaces, which range in value from $20 to $140 a ton. Its ledge is 50 ft wide, has well-defined walls, and promises to improve in value as greater depth is attained. It is joined on the west by the Mimbres mine, another very promising piece of property, the ledge of which has been crosscut a distance of 50 ft, and already ore to the value of nearly $20,000 has been extracted from it and worked. It is an immense mass of mineral, and its width has not yet been ascertained. The east wall is lime, the west wall shale, and on the east side of the lime, between it and the Oriental and the Belmont ground, is a belt of splendid looking quartzite. From 10 to 15 tons of ore, valued at from $20 to $125 per ton, is shipped weekly to the Richmond furnaces. The Altoona is owned by Messrs. Molino and Frazer, and every week shipments of good ore are made. The Reserve mine owned by Whittenburg and Hamilton, is also shipping ore. The Silver Lick is leased by some Cornish boys, who are extracting ore and doing well. The Marguerita is owned by J. Haines and others, but it is now leased to parties who are making shipments of splendid ore every now and then. Some French Boys secured a good lease recently, and they are said to be doing well.

ORE SHIPMENTS.—*Sentinel*, Jan. 24: The shipments of ore to the Richmond furnaces the past week have not been very large, but they have been almost as numerous as usual. Among the mines shipping from Prospect Mountain were the Lord Byron, Tiger Lily, Excelsior, War Eagle and Tiger. The following Adams Hill mines also made shipments: Herculean, Oriental and Belmont and Macon City. The following companies shipped their ores to the Eureka furnaces as follows: Summit, 7 tons; Silver Connor, 22½; Bowman, 33½; Altoona, 11.

Newark District.

AT WORK.—Eureka *Sentinel*, Jan. 24: Some 20 men in all are working in the several mines about Newark. The Bay State and Battery properties are making regular shipments of ore that pay a handsome profit. Recently a good strike was made in the Poor Man mine, and a shipment of $155 ore was made from it last Monday. The Bay State men talk of constructing a furnace in the spring—the leaching process—as they have plenty of good ore in sight, and they will thereby save the cost of shipping it to the furnaces here. Everyone there is hopeful, and work is progressing favorably in the mines that are being worked.

Pyramid District.

A SYSTEMATIC PLAN.—Reno *Gazette*, Jan. 26: Those who have watched Pyramid camp the closest feel that the time has come when the mystery is to be solved, if it has not already been done. A systematic plan of prospecting has been made out, and it will be followed, no matter what occurs. The company has put David Monroe Tyrrel in charge of mine as superintendent—a man who has had many years of experence on the Comstock, at White Pine, Aurora and elsewhere. J. H. Kinkead is general manager. The water jacket furnace is being set up by Thomas and Hughes, of Virginia City—both thorough workmen. Mr. Thomas is night foreman in the Belcher mine. The work of prospecting has been begun on three levels, 14 men being now employed. They are all in the front ledge, the back one remaining unopened as yet. On the tunnel level, 550 feet from the top, drifts have been started both ways on the ledge. They are not through the old ground yet, and are so far simply old works cleaned out and newly timbered. On the 500-foot level a drift has been started northwest, along the ledge, and it is in 50 feet. It has the rich black ore in abundance. It comes in at a point and widens out, and then goes out at the side or pinches out again. The bunches run all the way from one to eight or ten feet wide and eight to ten feet in length. The whole drift is in ore but of a lower grade. A cross-cut run shows the ledge to be ten feet wide. These ore bunches heavy with iron in it also. On the 370-foot level a drift has been started along the ledge to the northwest also. It is 60 feet into the old workings. Ore is being stoped out from the winze connecting the end of the tunnel and the bottom of the shaft. The men began at the 500 level and are working up towards the 400; there is good ore all the way. Mr. Tyrrell says, the fact is, very little is known of the mine. The shaft went down in good ore most of the way, and the upraise from the tunnel also, but no prospecting has been done that got far out into the mine. The work has all been done close around the upraise. It will be the first business of the company to get out into the dark corners and see what the ledge holds.

Rebel Creek District.

ORE SHIPMENT.—*Silver State*, Jan. 24: Ore to the amount of 22,000 pounds, from the Ohio mine, at Rebel Creek, was shipped from this station Thursday, to Salt Lake City, for reduction.

Reese River District.

WAITING FOR ORE.—*Reveille*, Jan. 24: The Manhattan mill has hung up its stamps in order to let the ore houses get filled again. The mill expected to suspend work last Monday, but the leasers kept crowding in their ore and kept it going a little longer. As soon as the ore dumps get large enough to justify starting, the mill will again begin its welcome work.

Secret Canyon District.

PROGRESSING FAVORABLY.—Eureka *Sentinel*, Jan. 24: Work is progressing favorably in many of the Secret Canyon mines. About forty men in all are delving in the bowels of the earth there for the precious metals, nearly all of whom are tributers and leasers. A visit among them on Sunday last made manifest to us the fact that while none of them are making $100 a day, there is not a man among them who wants to "strike out" for other parts. They are all apparently satisfied and sanguine that their camp and the entire of Eureka district is yet to see booming times. It is said on good authority that the men who are working in the Geddes mine are extracting some of the finest-looking ore seen in that section in a long time. Within the next ten days the building now being erected in connection with the Little Minna mine will be completed, when work in the shaft will be resumed and its depth increasd. There is no question but that this is a very promising property, the ore in the entire of the bottom of the shaft being of a good character.

Wild Rose District

THE PARADISE VALLEY MILL.—*Silver State*, Jan. 21: J. V. McCurdy, superintendent of the Paradise mill, is now in Spring City, and work will soon be commenced upon the construction of a new mill. He has purchased 90,000 ft of lumber, ten car-loads of which have arrived at this station. While in California, he purchased for the company three complete Huntington centrifugal mills, embracing nine Cornish jigs, three sizers, six Triumph concentrators, one agitating concentrator, one dryer and one rock-breaker. The mill will be driven with a Leffell wheel, with a head of 51 ft. He has secured a force of carpenters and millwrights, and will immediately have his lumber and machinery transported from this place to the mill-site, and the mill will be built and put into running order at an early day. His new mill process will be concentrating the ores. The reduction of the ores heretofore realized a very handsome profit. The company has plenty of funds on hand for rebuilding, and therefore there will be no delay. The mill will be of 24-ton capacity, and Mr. McCurdy says that as soon as the works are in operation, the company will immediately be able to resume the paying of dividends. The mines of the company—the Paradise Valley and Wild Goose—show large bodies of ore in all their levels, which assay to a large figure. At the present time there are 700 tons of good ore and a large quantity of concentrations at the mill-site. When the company get well at work again, the Wild Goose will be prospected by going into the lower level of the Paradise, which is now in 800 ft, and by drifting 500 ft the Wild Goose ore will be cut at the depth of 700 ft. This will require an air-compressor, and a total outlay of about $10,000. When the mill starts up, things will look cheerful and lively around Spring City, and, in fact, we shall all feel the good effects of the coin that will be distributed about in this portion of the county.

ARIZONA.

IN BAD SHAPE.—*Mining Index*, Jan. 20: The affairs of the Arizona Copper company, of Clifton, are said to be in a some what embarrassed condition owing to the decline in the price of copper. The property was bought for $1,700,000 in the first place, while the expenses incurred in building railroads, etc., were simply enormous. It is an example of the old saying that "it takes a gold mine to work a silver mine." It is to be hoped that no interruption of the working of the mines will occur, as it would throw a large number of men out of employment.

MILL FOR QUIJOTOA.—Arizona *Citizen*, Jan. 24: The Bonanza mining companies' who have bought the Hermosa mill at Harshaw, have brought men down from Nevada to take it down and will proceed to move it to Quijotoa at once. Mr. Patton, who has the business in hand, arrived here this morning and will see to the erection of the mill at Quijotoa. This mill is of 20 stamps, with capicity for 40. It is one of the best plants ever brought to this Territory and cost about $160,000. It is erected to make way with the surplus ore that has accumulated in developing the mines. Other mills of larger size will be added when sufficient developments are made to permit of the mines being worked to their full capacity.

KING.—J. H. Brown and Chas. Luedke, of Silver King, spent several days in Globe this week. They report business at the King unusually brisk. The King mine is working a full force and the mills are kept steadily running. The Lost Prize, of which W. E. Spence is superintendent, they say is one of the very best silver mines in the district. Large hoisting works have been secured and work in the mine is being earnestly prosecuted. Two wagon loads of Lost Prize ore were sent to Benson for reduction, one day this week. Work is being done on various other claims in the King district, which contributes to the general prosperity of the camp.

FAME.—The owners of the Fame silver mine on Quartzite hill, are developing that valuable property in a systematic manner. The tunnel in which work is now being prosecuted, is in 300 ft and the ore maintains its high grade. A track will soon be laid the entire length of this tunnel, which will facilitate the moving of the ore. A Burleigh drill has been secured and will be used immediately for prospecting the mine. There are other claims on Quartzite, which promise well, considering the hard work done on them.

COLORADO.

GEORGETOWN.—*Courier*, Jan. 22: Work has been resumed on the Peters mine which has lain idle for a long time. Georgetown tunnel struck despair on the north wall of the Griffith, and are cross-cutting to the south wall. Hensley & Co. are working the Range Line lode at Dumont, and are taking out good quantities of ore. Clark & Darling have taken a lease upon the No. 8 lode in the Diamond tunnel and commenced work this week. Bowden, Kneebone & Co. have struck a four inch streak of ore in the Maine, which shows gray copper and ruby. A large streak of honey-comb quartz is shown in the bottom of the Dew Drop shaft, from which many fine specimens of free gold have been taken. Quite a large force of men are working on the Snowdrift at present. A portion of them are leasing, while others are putting the mine in order for extensive work. The Frostburg mine is turning out large quantities of low-grade mineral. A drift is being driven from the bottom of the Frostburg shaft to cut the old Dunderberg shaft. Moore & Co., lessees on the Joe Reynolds, employ about 30 men and the ore shipments are very large. The ore is all shipped to the Idaho Springs, a fact which Georgetown greatly regrets. Lynn, Hinds & Co., have struck good pay in the lowest level of the Baltimore mine, going east from the shaft. Peterson & Co. going west on the same level, also have a fine streak of good ore. The Victoria tunnel has been passing a tough quartzite for the past two months, and headway is necessarily slow. The contractors have sub-let their contract at an advanced figure. The tunnel is to be driven about 175 feet further. Simmons & Co. are driving the Star of the West tunnel to cut the Cass county lode, upon which they have a lease. The heading is now beyond the apex of the lode, and they expect to cut the vein at any time. The Olive Carr lode, which adjoins the Cass county, will be opened up by the tunnel. In the heading of an adit on this vein, five inches of very good mineral was recently struck. The Home Sweet Home lode at the head of Fall River is turning out a good producer of gold ore. A 100 foot adit has been driven in the breast of which there are three feet of quartz which returns $50 gold per cord under stamps. The weekly returns are about $400. Two men are employed and they keep a 5-stamp mill running day and night. The owners are John Owen and John Tucker.

IDAHO.

LITTLE ROCKIES.—Cor. Ketchum *Keystone*, Jan. 20: I will give you a short sketch of the country. There are six small gulches carrying gold in paying quantities; that is, will pay from $3 to $6 or $7 per day. More will get $3 than $7. These gulches are all short, steep, and very narrow, and the pay streak small; consequently the placer ground will last but a few months in the spring, at best. As for quartz, there is but little known as yet whether there is any chance for a quartz camp or not. I have some locations carrying gold and some that is all galena, but they will have to be very rich to ever pay, as the ledges are small. I have sent ore out to have tested; will know when I get returns. I think I have the best ledges found so far, but don't feel much elated over what I have. This is a small mineral-bearing country—60 miles will take one clear around the Little Rockies. In the center there is two high peaks of porphyry and granite, in which all those gulches head that carry gold. From the foot-hills half way up to the summit is lime or what experts would call dolonite, with no indications of mineral whatever, so far as I have been able to examine.

WONDER.—Ketchum *Keystone*, Jan. 20: Mr. Joseph Galatian came down from the Wonder the other day, and from him I learn that the mine is looking remarkably well, and they intend to have a good supply of ore sacked, ready for shipment in the spring. There is a four foot vein of ruby silver, from which the following assays have just been made: No. 1, sampled (8 inches wide) $710 per ton; No. 2, $17.90; No. 3, $84; No. 4, $99. It is gratifying to learn of the prosperity of our mines, and it gives renewed courage to wait patiently for the long looked for good times.

THE LAST CHANCE MINE.—Wood River *Times*, Jan. 23: Robert W. Chapin, of New York City, has finally, after prolonged negotiation, succeeded in securing a lease upon the Last Chance mine and Mattingley mill, at Atlanta, the property of the Atlanta Hill Mining and Milling Company. The lease is to run for ten months from January 9, 1885, and Mr. Chapin agrees to expend at least $1,500 per month on the property, or $15,000 altogether, and to sink the main shaft at least 50 ft deeper. The people of Atlanta will be glad to learn that this excellent property is at last to be exploited in a workman-like manner. Adjoining the Atlanta and Buffalo mines, and having yielded large sums of money, notwithstanding the grossest mismanagement, there is no better gold claim in the country than the Atlanta Hill.

THE EUREKA MINE.—At the Eureka mine, Bullion, the ore-body is fully eight ft in width, and so easily worked that four men can knock down 15 tons a day—the quantity of first-class ore shipped from the mine. A large force was employed for a while, but about one week ago most of it was laid off, as the concentrating works and teams were unable to keep up with the output of ore.

MONTANA.

THE GRANITE MOUNTAIN MINE.—The *Inter-Mountain's* Helena correspondent writes that Hon. F. L. Perkins speaks glowingly of the outlook of the Granite Mountain property. He claims that the new 20 stamp mill, built by Frazer & Chalmers, which was started into operation on the 10th of December is the most perfect structure of its kind in the world. From the 10th to the 31st of December, the bullion product was $60,000. Since that time the output has averaged $17,000 per week, and it is expected that by making certain changes in the stamp screens it will be increased to $20,000 weekly, or at least $75,000 per month. The ore at present being treated, Mr. Perkins states, pulps $130 per ton and the amount of it in sight gives assurance of large and continuous dividends in the future. The Granite Mountain is a remarkable prosperity and the intergrity and ability of the management leave no room to doubt that it is being developed with an eye single to the interests of the stockholders.

BLACK ROCK.—Butte *Miner*, Jan. 21: This property owned by Clark and Warren, and leased for six months, is in a promising condition. The main shaft on the lead had been sunk 30 feet, and a tunnel run in 50 feet. Since the influx of extra miners and practical men, this lead and quite a number of others in the vicinity have been taken hold of and will be explored in a workman-like manner. From the face of the tunnel the new lessees ran in about 10 feet, and striking a 10-foot vein of free-milling ore, began sinking. They are down now about 20 feet in the tunnel and taking out 40 ounce ore, which is sent to the Colorado smelter for treatment.

EVELINA.—Swain and Hitsleton have leased this mine for one year and for the past few months have been engaged in erecting cabin, shaft house and other buildings and otherwise getting ready for active operations. The vein of ore at the Evelina is well defined and five prospect holes from 20 to 30 feet deep have been sunk along the ledge.

THE SHARK LODE.—Lays between the Little Darling and Nautillus and was owned by John H. Curtis and John Ducle. Yesterday Green Majors purchased a one-third interest in the lead and the mine will be gotten in readiness for actual development. Three holes from 15 to 20 feet in depth have been sunk along the lead and one of them will be continued and known as the shaft. The ore body shows eight feet of ore which samples, across the face 20 ounces.

NEW MACHINERY.—*Inter-Mountain*, Jan. 20: Parke, Lacy & Co. have furnished a new style iron geared horse whim for the Blue Bird mining company, Independence district. It was put in operation Tuesday, and gives the utmost satisfaction. The first cost and cost of erection is less than the old style whim, and it will hoist from 500 to 700 pounds, 60 to 70 feet per minute. The above firm have a justifiable pride in the working of this new piece of machinery.

NEW MEXICO.

GENERAL NOTES.—Silver City *Enterprise*, Jan. 17: Ore has been struck on the Franklin, at Fleming. The Mimbres and McGregor mills started up on Wednesday, after remaining idle for several days, being unable to obtain wood and ore, owing to the bad condition of the roads. Williams Bros. and E. G. Shields are getting out about 5 tons of ore a day from the Sherman mine, and much of it is of excellent quality. The ore body is exposed for a width of 15 ft. There is no truth in the report circulated last week to the effect that the bond on the Young Man mine has been thrown up. Two cars of high-grade ore were shipped from this property last week and 80 tons more are ready for shipment, and will be sent to Socorro for treatment, as fast as teams can be procured to haul it. The mine is looking better every day. The Chance mine, at Victorio, owned by Haggins, Head & Hearst, is proving to be one of the rare gems as a producer of southern New Mexico. For many months this property has paid but little more than expenses, as the grade of ore which was being worked was very low and the dead work that was constantly in progress combing with the high cost of shipping and treating, to consume the proceeds of the mine. Last week the owners were rewarded for their exploitations in blasting into the largest ore body thus far encountered upon the property. Neil Boyle, the superintendent, has no hesitancy in pronouncing it a bonanza. It is a very desirable grade of carbonate ore running high in silver and is much sought after by the smelters.

GOLD HILL.—After a month and a half of careful inspection I cannot but conclude with many others that this camp has one of the most promising outlooks of any in the Territory. Judging from surface indications there has never been a camp that showed so great a promise with so little development. The ore shows on the surface in a free state, gold and silver predominating and there seems to be no scarcity of the precious metals. The formation is a contact of porphyry and granite. Every few days brings the announcement of a new strike, and assays of from $500 to $5,000 are of no uncommon occurrence. One of the most promising prospects is the Grand Tower mining claim, owned by Lewis & Cottrell. They have two leads on which they are working. Shaft No. 1 carries native and horn silver in profuse quantities. On shaft No. 2 they are about 10 ft below the surface, having a full breast of ore that carries native silver in abundance. Bob McCone has just made a new strike showing a vein of about 20 inches, assaying 1 hear, $1,500. Snyder & Snowden are taking out ore from their claims. Kennedy & Neddo are taking out ore from their claims. Black Parks & Co. are preparing to ship. Cunningham is preparing to ship from the Reservation. Giddings & Miller are shipping from their claims. Goodwin is preparing to ship from his silver claims. Snyder & Hensley have struck native silver in their claims. James Winters has also native and horn silver in plenty on his claim. There is a general appearance of activity and bustle about the camp which is dotted all about with tents. Prospectors are daily coming in and there are in and about camp fully 200 men prospecting and mining. Some ores have been treated at Socorro by the Billing smelter but the returns were not to the entire satisfaction of all parties. One man sent two samples of ore, one to Billing and one to Benson, from the same mine, carefully selected. The returns from Billing was a charge of $5 for sampling; from Benson, $50 net. There was free gold to be easily seen in almost every piece of rock sent. I apprehend the Socorro works will not reduce much Gold hill ore

OREGON.

NOTES.—More rain is wanted. The miners of Josephine county have plenty of water and are making the most of it. T. J. Neff and others are engaged in mining in the Wagner Creek district, and expect to do well. Jas. T. Jones of Siskiyou county, Cal., has gone to Rock Point, in the vicinity of which he has a quartz ledge. Very little rain has fallen during the week and miners are inclined to become discouraged over the prospects, as most of them have little water for mining purposes. Roten Bros. have discovered some excellent diggings in the Kane Creek district, but owing to scarcity of water have done very little work. They picked up a nugget worth about $19 a few days since. A company, consisting of Messrs. Fields, Cook and Rummel, have promising diggings on Ashland creek and are digging a long ditch in which to bring water on them. They have three miles of it dug.

UTAH.

STAR DISTRICT.—Southern Utah *Times*: It looks as if we are to have a new era in Star. Some time ago Don Wickizer, by chance, found ore in a contact of lime and granite, which is extraordinary rich in silver, and seems to be permaaent from devclopments made. Your correspondent seeing the Don Wickizer mine, thought that other contacts (of which there are many in the vicinity of Shantie) might be just as fruitful, has prospected some of them and found ore of a similar character in all. From what I learn, these contacts have never been prospected at all, because the ore never crops out or throws any float from the ledge. There are a great many of these contacts on the west side of the range, where the dolomite lime and granite alternately prevails, and it is the opinion of our correspondent that the salvation of Star lies in these contacts, which will be proven if they are ever worked. We are expecting better times here next summer.

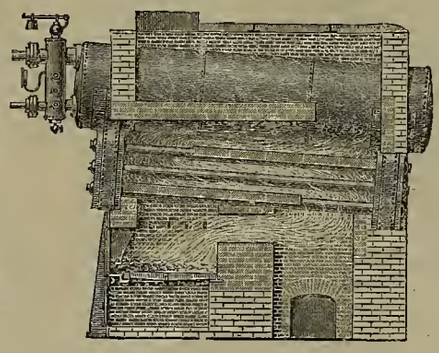
HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.



TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

SEND FOR CIRCULAR AND PRICE LIST.

Nos 129 and 131 Fremont Street - - - SAN FRANCISCO, CAL.

THE CUT REPRESENTS OUR

IMPROVED

HYDRAULIC

MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. SEND for Circulars and Price List. IRON CASTINGS OF ALL DESCRIPTIONS.

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

A. CHAMBERS,

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

The Senate Committees.

Two weeks ago we gave a list of the standing committees and names of committeemen of the Assembly. The following is the same enumeration as regards the Senate:

On Agriculture—Foster, Chairman; Cox, Langford, Spencer of Stanislaus; Taylor, De Long, Johnson of San Bernardino, Steele and Parker.

On Claims—Dougherty, Chairman; Beauvais, Creighton, Kelly, Boone, Parkinson and Drumm.

On Commerce and Navigation—Kelly, Chairman; Drumm, Lynch, Parkinson, De Long, Dougherty and Whitney.

On Corporations—Kellogg, Chairman; Knight, Drumm, Cross, Wright, Lowe, Vrooman, McClure and Kelly.

On Counties, County Governments and Township Organizations—Spencer of Napa, Chairman; Baldwin, Knight, Johnson of Sonoma, Johnson of San Bernardino, Parker and Chandler.

On Education—Johnson of Sonoma, Chairman; Perry, Lynch, Vrooman, Del Valle, Boone, Spencer of Stanislaus.

On Engrossed Bills—Filcher, Cross, Mahler, Kellogg, Palmieri and Routier.

On Enrolled Bills—Cox, Filcher, Langford, Steele, Wallis and Spencer of Stanislaus.

On Federal Relations—Baldwin, Whitney, Drumm, Dougherty and Wallis.

On Finance—Knight, Cox, Kellogg, Days, De Long, Johnson of San Bernardino and Vrooman.

On Hospital—Knight, Saxe, Wright, Baldwin and Spencer of Stanislaus.

On Judiciary—Cross, Taylor, Speneer of Napa, Reddy, Baldwin, Johnson of Sonoma, Kellogg, Vrooman, Lowe, McClure, Del Valle, Perry, Whitney, Days and Boone.

On Military Affairs—Drumm, Baldwin, Foster, Lynch, Perry, Lowe and Boone.

On Mines, Drainage and Mining Debris—Mahler, Kellogg, Cross, Filcher, Wallace, Hurlhurt and Beauvais.

On Public Buildings—Baldwin, Spencer of Napa, Creighton, Dougherty, Lowe, Vrooman and Days.

On Public Swamp and Overflowed Lands—Cox, Parker, Langford, Foster and Vrooman.

On Public Morals—Saxe, Johnson of Sonoma, and Chandler.

On Public Printing—Spencer of Stanislaus, Filcher and Steele.

On Roads and Highways—Langford, Beauvais, Knight, Steele, Taylor, Hurlburt, and Johuson of San Bernardino.

On State Library—Del Valle, Cross and Hurlburt.

On State Prison and Prison Buildings—Reddy, Foster, Spencer of Stanislaus, De Long, Knight, Kelly, Routier, Parkinson and Perry.

On Irrigation and Water Rights—Taylor, Saxe, Reddy, Johnson of San Beruardino, Cross, Whitney, Foster, Del Valle and Beauvais.

On Fish and Game—Foater, Wright, Cox, Kelly and Parker.

On Elections—Kellogg, Wright, Spencer of Napa, Drumm, McClure, Vrooman and De Long.

On City, City and County and Township Governments—Johnson of Sonoma, Cox, Dougherty, Del Valle, Johnson of San Bernardino, McClure and Whitney.

On Labor and Capital—Dougherty, Creighton, Lynch, Days and Chandler.

On Chinese and Chinese Immigration—Kelly, Chandler, Lynch, Foster, Palmieri, Steele and Routier.

On Apportionment and Representation—Del Valle, Filcher, Hurlhurt, Langford, Reddy, Chandler, Spencer of Napa, Wright and Palmieri.

On Forestry, Yosemite Valley and Calaveras Big Tree Grove—Creighton, Spencer of Stanislaus, Cox, Beauvais and Saxe.

Mining Share Market.

There has been no special animation in the mining share market this week, prices having remained low. The shutting down of all work below the Sutro Tunnel level has taken away the confidence of some operators in Comstock shares.

At the north end the Sierra Nevada Company are preparing to resume work in the many veins they possess in Cedar hill. There are scores of old miners here who would like nothing better than to be allowed to go upon Cedar hill and help themselves to what they could find. The Ophir, Mexican and Union Consolidated are now running a drift north on the 500 level preparatory to the exploration of a great scope of ground at that depth passed by without examination in the early days. At the Best and Belcher and Gould and Curry they are opening a station at the 1000 level of the Bonner shaft, from which will be run a north lateral drift which will open up a large area of hitherto unexplored country. At the middle mines all is going on well.

Down at Gold hill the Yellow Jacket, Crown Point and Belcher Companies are going on the even tenor of their way. They are steadily extracting sufficient ore to keep the mills on the Carson river in full blast.

REMOVALS.—The California Wire Works have moved to their new premises, at 329 Market street, corner of Fremont. Morris & Varney, dealers in iron, steel and heavy hardware, are now occupying the premises formerly used by Whitney & Marshall, 22 and 24 Fremont street.

MINING SHAREHOLDERS' DIRECTORY.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Sales at San Francisco Stock Exchange.

QUEEN VICTORIA and the council have ratified the hethrothal of the Princess Beatrice and Prince Henry of Battenburg.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JANUARY 13, 1885.

310,549.—AMALGAMATOR—M. P. Boss, Oakland, Cal.

310,656.—ROCK CRUSHER—A. G. & J. M. Dyer, S. F.

310,859.—PIPE AND DRAIN TILE MOULD—Earl & Hazard, Los Angeles, Cal.

310,671.—SPREADER FOR THRASHERS—Geo. W. Gould, Yolo, Cal.

310,672.—HOSE COUPLING—S. R. Hackley, Crockets, Cal.

310,673.—DEVICE FOR SECURING MOULDINGS—C. Halstrom, Los Angeles, Cal.

310,585.—WHEEL FOR VEHICLES—W. H. Harding, Springfield, Cal.

310,825.—BLOWER FOR FIRE GRATES—S. C. Houghton, S. F.

310,710.—GUIDE FOR BORING DOORS FOR LOCKS—C. F. Nichols, S. F.

310,610.—TICKET HOLDER—W. Patterson, S. F.

310,679.—ORE FURNACE—E. F. Russell, S. F.

310,621.—TWO-WHEELED VEHICLE—J. G. Stocks, S. F.

310,744.—GAS RETORT—A. C. Swain, Chico, Cal.

310,746.—TWO-WHEELED VEHICLE—Taliaferro & Mitchell, Hueneme, Cal.

FOR WEEK ENDING JANUARY 20, 1885.

310,932.—BOOT NAILING MACHINE—A. Cavalli, S. F.

310,892.—PERMUTATION LOCK—Chas. Hill, Los Angeles, Cal.

311,013.—ICE MACHINE—J. C. Kitton, S. F.

310,951.—HAY CARRIER, ETC.—I. N. Matlick, San Jose, Cal.

310,952.—HAY ELEVATOR, ETC.—I. N. Matlick, San Jose, Cal.

311,032.—QUARTZ MILL—A. E. Redstone, S. F.

311,041.—SIDE HILL SULKY PLOW—A. D. Sewell, Colton, W. T.

311,149.—CHIMNEY FOR DWELLING HOUSES—W. E. Stevens, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FILLING MACHINE FOR CANS, ETC.—Jamea J. Gorman, Temescal, Alameda Co., No. 310,268 Dated Jan. 6, 1885. This is a filling machine for cans and other vessels of that class, in which the supply for filling the series of vessels is regulated automatically, by means of a displacement weight or body; and the invention consists in a peculiar arrangement of tanks, measuring cups, displacement body, and feed and discharge mechaniams. The object is to provide a machine which is adapted to provide automatically a supply of liquid, and to feed the supply in stated quantities to the cans or other vessels to be filled.

HORSE-SHOE NAIL.—Joseph Cairn Simpson, Oakland, No. 310,231. Dated January 6, 1885. This sort of nail is usually made of the best and softest iron obtainable, in order to give them sufficient ductility to form a proper clinch; but this softness makes them difficult to drive, and in addition to this, when cold pressed they become fibrous, so as to be easily split, in which case the horses foot may be seriously wounded when they are driven. Mr. Simpson forms his improved nail of prepared steel, having sufficient ductility to form a clinch without breaking. He prepares them in a peculiar way and forms one side convex and the other concave for a part of its length. When the nail is turned over, the edges of the concave portion will be imbedded into the surface of the hoof, and will be close and smooth, and the convex surface will be less likely to wound the opposite leg if it should be struck.

Bullion Shipments.

Minnie Moore, Jan. 20, $3,220; Ontario, 20, $21,958; Minnie Moore, 22, $5,570; Stormont, 25, $1,710; Minne Moore, 25, $2,300; Vienna, 25, $3,940; Christy, 25, $4,900; Queen of the Hills, 27, $8,000; Crescent, 27, $10,000; Vienna, 27, $3,830; Minnie Moore, 27, $2,126. There were shipped from Salt Lake during the week ending January 24th, one car refined lead, 22,056 pounds; seven cars ore, 199,230 pounds and twenty-five cars bullion, 544,666 pounds; making a total of thirty-three cars, aggregating 765,952 pounds.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—San Benito and Monterey Counties.
OKO. MCDOWELL—Santa Clara County.
WM. H. COOK—Fresno County.
G. W. INGALLS—Arizona.
W. WHITWELL—Oregon.
M. S. PRIME—Alameda County.
MRS. OZIER—Humboldt County.
E. G. NORTHUP, Sacramento County.

Concentrator Patents.

EDITORS PRESS:—Our attention has been directed to an article which appeared in your valuable journal of January 17th inst., relative to the "Embrey" Ore Concentrator, in which warnings are given that imitations of that machine are being manufactured in California which "combine the movements of the 'Embrey' with the construction of the (Frue) Vanner, and are offered as novel machines, with, of course, vastly increased (?) capabilities;" and the public are also therein "warned against imitations of this the 'Embrey' machine."

The presumption is the imitating machines therein referred to are the "*Triumph*" *Concentrators*, and that mining men may be informed of the status of the patents of the "*Triumph*" *Concentrator*, the "Frue" Vanner and the "Embrey" machine, we herewith subjoin references to the Letters Patent granted for the several machines above named:

Letters Patent No. 42,970, dated May 31, 1864, were issued to Mr. C. A. Stetefeldt, covering a form of concentrating device having an *end shake* movement.

Messrs. Johnston and Smith obtained, July 0, 1867, Letters Patent No. 66,490 for a device having a *lateral* or *side-shake* movement and *an endless belt*. This patent was sold to W. B. Frue, et als., and is now known as the "Frue" Vanner. W. B. Frue, on December 22, 1874, was granted Letters Patent No. 158,057, which covered only and substantially the improvements of No. 66,490 above quoted.

A. J. Embrey secured, March 22, 1881, Letters Patent No. 239,091, for a device essentially the same as that originally patented by Mr. Stetefeldt, first above referred to (No. 42,970), and we have eminent legal advice that these Letters Patent have no legal status. It will be observed that the patents Nos. 42,970 and 66,490, i. e., the Stetefeldt, and Johnston and Smith, respectively, have expired by limitation; the first on May 31, 1881, and the latter on July 0, 1884, and that, therefore, there are no existing patents covering either the side-shake or end-shake movements, nor the use of the endless belt.

Messrs. C. D. Smith, W. A. Sanders and George E. Woodbury were granted Letters Patent No. 261,177 on July 18, 1882, for a concentrating device now known as the "Triumph" Concentrator, the right to manufacture and sell which has been assigned to ourselves, the Joshua Hendy Machine Works. The movement of this machine is an end-shake over an endless belt, and the improvements in this invention and device consist in the novel features introduced into their construction, which are briefly stated as follows:

The *endless belt* is carried upon a supplementary frame, which is mounted on *springs*. The reciprocating movement which is imparted to this supplementary frame and belt, tends to settle and retain the sulphurets, and heavy and valuable metallic particles upon the belt, until they are discharged at the proper moment; this peculiar movement is of the utmost importance, and enables these machines to perform more work than any other Vanners or Concentrators yet devised.

We are assured that it cannot be maintained that the use of the end-shake and endless belt adopted in the form of construction of the "Triumph" Concentrators are in any manner an infringement upon any existing patents, and the reasons for such an opinion are obvious, viz., that the Letters Patent covering such use have long since expired by legal limitation.

It is upon the improved features entering into the construction of the "Triumph" Concentrator, and which are amply secured by Letters Patent, and applications therefor that the vast superiority of the operation of these machines rest, and wherever competition has been had, that superiority has been unquestionably demonstrated.

At the recent exposition held in Denver, Colorado, the "Triumph" Concentrators were awarded the medal of superiority in competition with the "Frue" Vanners, the "Embrey" machines and the "Rouse" Tables.

At the mill of the Original Empire Mill and Mining Company, in Grass Valley, Nevada county, Cal., the "Triumphs" proved themselves Triumphant in a practical competitive trial lasting 24 days, and the managers of that valuable property adopted and are now using eight of these machines, and we are assured that they are giving perfect satisfaction, and is it not pertinent to ask whether the quantity of water used through the batteries of any mill, which may be deemed necessary for the proper crushing of ores, is to be gauged for the purpose of accommodating the capacity of the "Frue" Vanners, and thereby incommoding the operation of the batteries and preventing the proper amalgamation of the ores. We do not ask millmen to so accommodate the "Triumph" Concentrators.

We deem it proper to observe, in this connection, that the complaints made by the agents of the Frue Vanning Machine Company that in the trial had at the above named mill, that the Vanners were forced to take *too much water* are impotent; for the distribution of water and pulp was equalized over the four machines during their period of operation, and if the "Frue" Vanners had too much water, why did not the "Triumph" Concentrators have also *too much water*.

The fact was there made apparent that these complaints arose simply from and were due to the inferiority of the operation of the "Frue" Vanners, and the superiority of the "Triumph" Concentrators, and it was then and there demonstrated that the "Triumphs" were never crowded, but could have concentrated a much larger quantity of pulp than the crushing capacity of the batteries delivered, and herein lies the fact, substantiated during that trial, that the concentrating capacity of the "Triumph" Concentrators is largely in excess of the "Frue" Vanners, and that where three Vanners are necessary to properly concentrate a given amount of pulp, that two "Triumphs" will perform the same work.

We now tender to the "Frue" Vanning Machine Company, who are the presumed owners of the "Embrey" machine, an acceptance of their challenge for the sum of One Thousand ($1,000) Dollars, to enter into such competitive trial, at such time and place as can be mutually arranged between any given number of "Triumph" Concentrators and the same number of either "Frue" Vanners or "Embrey" machines, and we are willing to abide the results.

JOSHUA HENDY MACHINE WORKS.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Market Reports.

Lumber at Wholesale.

The market has been moderately active, though receipts have been light of late. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $30; No. 3 do do do, $18; No. 4 (refuse) do do do, $12; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $20; No. 5 refuse) do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x8, 7 to 11 ft, $29; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and ¼x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates—Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.20; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for pine, fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x0, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

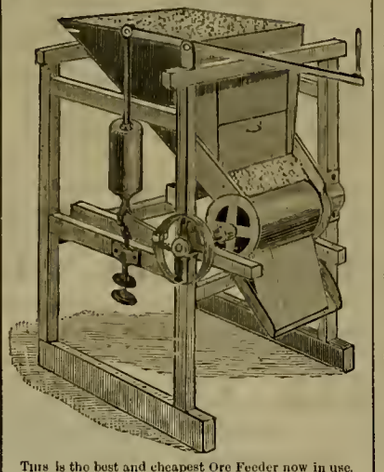
At the World's Fair.

Back numbers and the latest files of this paper will be found in the California Department, and also in the Newspaper Exchange Department, of the World's Fair, New Orleans. Mr. W. H. Jessup, of the horticultural section of the California Department, can be consulted on business terms for this office, extra copies, etc.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR FOR SALE, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free.

New Book on Assaying Gold & Silver Ores,

BY C. H. AARON.

For Practical Workers.—$1

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Gold and Silver Ores," "Leaching Gold and Silver Ores") that have been "successfull popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market Street, San Francisco.

N. B.—This is Part I of three volumes on assaying by the same author. To be followed by Part II—Gold and Silver; Part III—Lead, Copper, Tin, Mercury. A majority of the best mining publications yet printed have been issued by and are for sale by DEWEY & CO., publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights, as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

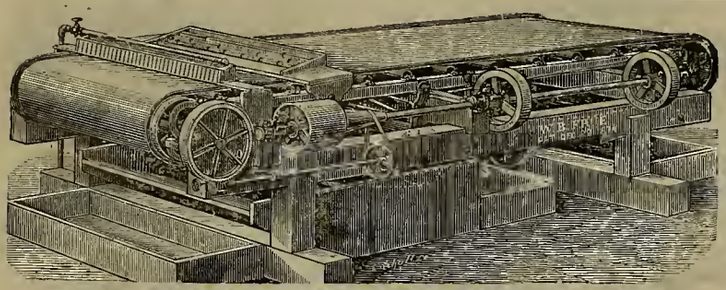
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

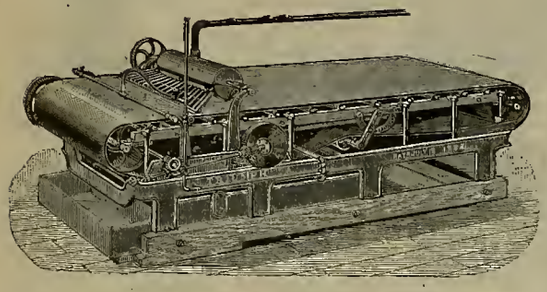
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue' Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $109.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 Fremont St., San Francisco, Cal.

PACIFIC IRON WORKS

1850. 1885.

RANKIN, BRAYTON & CO.,
....BUILDERS OF....
MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work: MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

HOISTING WORKS

Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

Adapted to all Requirements.

HOISTING WORKS

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending December 31, 1884, the Board of Directors of the German Savings and Loan Society has declared a dividend on term deposits at the rate of four and thirty-two one-hundredths (4 32 100) per cent per annum, and on ordinary deposits at the rate of three and six-tenths (3 6 10) per cent per annum, and payable on and after the 2d day of January, 1885. By order

GEO. LETTE, Secretary.

DIVIDEND NOTICE.

Plymouth Consolidated Gold Mining Company, No. 23 Nassau street, New York Jan. 5, 1885.

DIVIDEND No. 20.—The Board of Trustees of this Company have this day declared the regular monthly dividend of fifty thousand dollars, being one per cent on the capital stock, or fifty cents per share, payable on January 9, 1885. W. VAN NORDEN, President.

HEALD'S BUSINESS COLLEGE, 24 Post St. S. F. Send for Circular.

ASSESSMENT NOTICE.

Fremont Mining and Milling Company.—

Location of principal place of business, San Francisco, Cal. Location of works, Amador county, near Drytown, Cal.

NOTICE is hereby given that at a meeting of the Trustees, held on the twenty ninth day of December, 1884, an assessment (No. 1) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourth day of February, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday the twenty-seventh day of February, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Sec'y.

VOLUME XLXX. Number 6.

Smelting Furnaces.

Within the last few years the production of iron and of the metals generally, by a given furnace-plant, has been largely increased, in many instances trebled. Iron-furnaces exceeding 100 tons' capacity per diem are now the rule in new constructions. Copper and lead furnaces smelting from 60 to 100 tons of ore per day are common. With this greatly augmented product, the life of furnace-linings has been diminished, and recourse has been had to various cooling devices for prolonging the life of such linings. The most recent improvement is that patented by Arthur F. Wendt, of New York City, and described him in a paper read before the American Institute of Mining Engineers.

The common course of projecting water against the exterior of the brickwork of a furnace has been in a large measure abandoned by our most progressive managers. All have recognized the danger of this proceeding, especially when applied to the crucible of a furnace below the line of the tuyeres. Cast-iron water-jackets, with wrought-iron pipes for circulating the cooling water, have replaced the cruder methods. In iron-smelting the use of such jackets has been confined to the crucible and the space around the tuyeres; and it has been the custom to support the jackets on the brickwork of the furnace. But the erosion of the brickwork below tuyere-jackets allows them to sag, and often displaces the alignment of the tuyeres and leads to other annoyances.

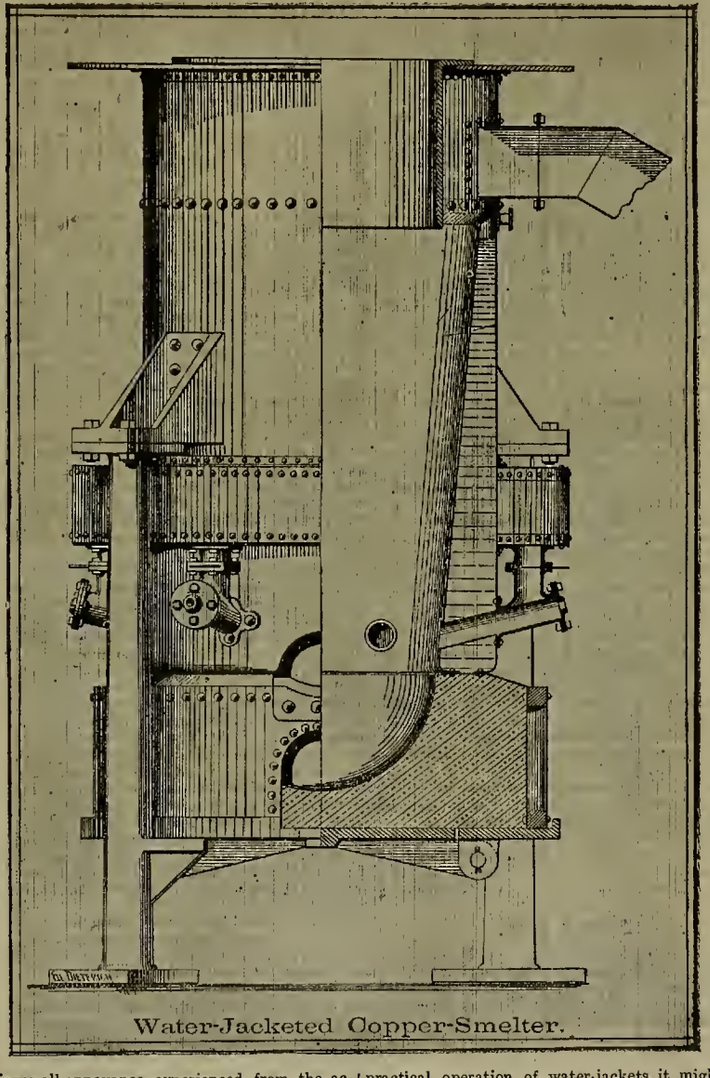
The principle of construction adopted by Mr. Wendt to remedy this and other evils, is to use a thin fire-brick lining (not over nine inches) from the tuyeres up to the bosh, to back this lining with wrought-iron or steel water-jackets, *hung* from the mantel-ring, and thus to carry the whole weight of the furnace and its filling upon the supporting pillars. The crucible proper is lined with three or four thicknesses of fire-brick on the sides, and not less than 48 inches in the bottom. It is supported on independent pillars, and is practically an independent structure. It could even be placed on wheels and made removable, were there any adequate advantages to be gained by such an arrangement.

An essential point in the construction is the annular space left between the jackets through which the interior of the crucible can be reached, and the crucible-lining can be repaired without blowing out the furnace. It is immediately below the water jacket that the cutting action of the molten cinder is the greatest; it is this space that can be most readily reached from the outside. From the bosh to the tunnel head the furnace presents no novelties. Above the brick work of the tunnel head the construction is entirely of iron, and differs widely from that usually adopted.

There are two floors supported by brackets attached to the shell of the furnace. Resting on the lower floors are heavy iron columns supporting the dome. Closing the space between the columns are thin cast plates, firmly keyed to the columns. It is against these plates that the stock strikes, upon the lowering of the bell, thus effectually preventing the wear of the brick lining near the tunnel head.

The charging hopper hangs from the charging floor, and its lower edge overlaps and rests on the circular angle-piece. This angle-piece is turned true, and makes a gas tight joint with the bell. It is cast in three or more flanged segments, which are bolted together and keyed fast to the top of the dome. If the angle-piece is chipped off or otherwise destroyed, the segments can be replaced.

Should the furnace be blown out the plates are removed, the hopper is filled with water, and a spray of water is kept on the dome. In smelting ores of iron, copper or lead containing an appreciable amount of zinc, an iron top replaces all annoyance experienced from the accumulation of cadmia. The zinc condenses against the iron, and can be removed without trouble. As stated, this description applies to the blast furnace with bosh water-jacket and iron top, for iron ores.



Water-Jacketed Copper-Smelter.

Since the writing of the foregoing, an iron-furnace to which Mr. Wendt had applied the water-jacket, has been blown out. The brickwork on the jacket is from six to nine inches thick, and the furnace has there preserved its shape. The bosh has a smooth surface and no re-lining is required. Above the bosh the lining has been cut irregularly. Around the tuyeres no brick-lining remains; and the furnace has been running on a slag-lining.

The engraving on this page shows the general arrangement of a 36-inch water-jacket copper-smelter of the type now common throughout the West, arranged according to Mr. Wendt's improvement. No lining whatever is used in the shell. The crucible is built up of fire-clay, rammed into place. The bottom of the furnace can be dropped, as is usual with iron cupolas. Lead furnaces are constructed on the same general plan.

To iron-masters not acquainted with the practical operation of water-jackets, it might seem by their use a large loss of heat is occasioned. But this cannot be the case, as a little reflection will readily prove. The bosh of an iron furnace, especially that part immediately around the tuyeres, invariable cuts out, sometimes within a few days after going into blast, until the lining has become very thin, and the tendency of the heat to destroy the material is checked by the loss of heat by conduction and radiation from this material itself. Now, whether this loss of heat is conditioned by the surrounding air, or is controlled by a circulation of water, can make no difference in the fuel-consumption. To preserve a certain thickness of brick, a certain number of heat-units must be carried off.

The smelting process, however, goes on much more uniformly in a water-jacket, which preserves the shape originally given to the interior, than in a furnace with thick walls cut into irregular shape by the heated stock and cinder. Thus, an actual saving of fuel may ensue.

The principle of construction described can be readily applied to many existing furnaces, by raising them bodily and replacing the old-fashioned, short pillars, under the mantel-ring, with long wrought-iron ones.

Quartz Mines near Downieville.

The northern counties of this State are now attracting considerable attention among mining people, some of the mines there having recently made good records. Moreover, there are many promising ones which only need further development to prove good properties. The results achieved by a few men have had the effect of causing others to look in the same direction for new mines, and we expect to see this year quite a revival of the mining interests of Northern California. The following notes refer to two of the promising quartz mines near Downieville, Sierra county.

The Junction and Slug Canyon quartz mine is located about a mile and three-quarters up Slug canyon, near the junction with Mt. Vermont canyon, at which point is situated the 8-stamp mill, where four men are employed—day and night shift. The incline, 444 feet long, extends to the blacksmith shop, where the cars loaded with ore are rolled out from the mouth of the tunnel, 50 feet distant, around a sharp curve. The weight of the loaded cars going down draw the empty ones up the incline. John Skemo is underground foreman. Fourteen men are employed pushing the lower tunnel ahead and stoping. Length of lower tunnel, 167 feet. John Berry, of Nevada City, is amalgamator at the mill, and Jerome York feeder. Wm. Allen is blacksmith. A Pelton wheel within two inches of six feet in diameter, of a pressure of 227 feet, requiring 18 miner's inches of water to run the stamps. The water is brought in through two flumes from Slug and Mt. Vernon canyons. The ledge is at an altitude of about 1,000 feet above Downieville, and 4,000 from sea level. The batteries at the mill have not yet been cleaned up, but before the mill was built Mr. York, the original owner of this property, with his arastra obtained an average of $11 per ton. The ledge was struck 80 feet in from the mouth of the tunnel. The present width of the ledge in the lower tunnel is from 15 inches to two feet, and from two feet to seven feet in the upper tunnel. Stoping in the lower tunnel is expected to find the extension of the large chimney above. Giant powder is used. Considerable water is running out of the tunnels; ore prospects rich everywhere. The best of silver plates from San Francisco are used at the mill. F. E. Allen, out here about three months from Chicago, is general manager for the present owners, Cross and Simmonds, of of Nevada City. A large amount of cropping on surface.

The main tunnel at the Forest Queen, Dr. F. M. Bibsr's quartz mine, three-quarters of a mile up Slug canyon, above Downisville, is in 120 feet, blasted through red serpentine with giant powder, striking the ledge between slate and serpentine. Ore prospects $25 per ton; width of ledge about four feet. A. N. Whitelaw and Geo. Freis are developing the property for the owners.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

The Mineral Belt of Amador County—No. 5.

EDITORS PRESS:—The Hardenburgh mine lies just above Middle Bar, with a 20-stamp mill at Middle Bar, which has been idle some years. From the men that worked in this mine I learn that no better mine is in this county if properly worked by capitalists. There is a shaft of 500 feet on the ledge, with four or five levels of 100 feet apart and from 100 to 200 feet each in length. Good paying quartz was taken out of this mine from the very top all the way down to the 500-foot level, and it run from $5 to $10 and $15 per ton. There is also a good water ditch of 1,000 or more miner's inches of water and two and one-half miles long, that belongs to this property, which is owned by General Hardenhurgh, of San Francisco, California. Some $60,000 has been taken out of this mine. The ledge runs from 5 to 30 or more feet in width, and there is at least a big fortune for the parties who will take hold of and develop and work this mine again, as it is considered by all who have worked in it second to no quartz mine in Amador county to-day. I know of no better interest than this old Hardenhurgh mine at Middle Bar, but I understand that General Hardenhurgh does not intend himself to work it, though I believe he will sell it to parties who will work it in a proper manner, as half a million dollars of quartz is in sight to-day.

The next quartz mine one-half a mile north of the rich Amador Queen mine, of Shugart & Morgan, is the

Moor Mine,

Which has a good ten-stamp mill, and two Frue concentrators, that are, like the mill, as good as new. This was the old Howard mine and ranch, one mile south of Jackson, and one-half a mile south of the rich Zeile mines and mills near Jackson. Two or three shafts from 100 to 200 feet each, are upon this mine, with good hoisting works and buildings over them. The elder Howard died some years ago, and the younger brother died over one year ago here. Since the death of the first Howard, this property has been in litigation, but within a few weeks past, parties have bought this mine and the farm with it, and they will start up this mine and mill that during its working years proved so rich that it is considered the equal of the best of Amador county quartz mines. A good, wide quartz lead, well defined and with plenty of paying ore at hand, must make these joint owners a handsome, and a good-paying property, and they have the money to develop and work it in a proper manner. The next is the

Zeile Mine

At Jackson, with its forty-stamp mill, large concentrating works for sulphates, and one of the finest hoisting works, and everything else about the mine second to no mine and mill in California. They crush 130 to 135 tons of ore every day, and employ 135 men steadily. There are six or eight other good rich quartz mines at and close to the town of Jackson, any and every one of which will, when taken hold of and worked with $100,000 or more, of capital, and in a proper manner, pay as richly and prove as large "bonanza gold quartz mines" as any of the mines that I have mentioned in these communications or as any other mines in Amador county. Some of them are covered by quartz patents, others of them are held under agricultural patents. All that monied men have to do is to buy their farms or ranches and then they get both the farms and these quartz mines also with them, as the first owners are not able to develop and work them, or else they do not care about doing so, but would rather work their farms. The village of Jackson, which is the county seat of Amador county, has a population of 2,000. I will also state that there are many

Good and Large Ranches

Joining this three miles of quartz mines from 150 to 1,500 acres each. Dr. Chambers owns the first farm of 160 acres next to the rich Nevills mammoth quartz mine, which is one of the best and richest of soil ranches for grain, hay, grapes and all kinds of fruit to be found in the county of Amador. Besides it is one of the most beautiful places to reside in all the county. No frosts, ice-frozen ground or snow here. This place lies upon the main traveled road to the Nevills mine and Middle Bar, and which is the levelest and best road and drive as far as Belle Monte ranch and cottage, that leads out of Jackson in any direction. When the Doctor gets his farm opened up and fully improved, with the natural grove of alpine and other ornamental and evergreen shade trees that surround his cottage, one may well be content to "live and die" in such a home and climate as this. But a wife is wanting to make this home and place complete, which Dr. C. has not got, I believe.

The next ranch that joins Dr. Chambers is "Zack" Kirkwood's, as he is called here and is one of the largest and best worked places in the county and has 800 acres of good land well fenced and good large sheds and barns upon it with some three houses or more. Mr. Kirkwood also owns some 400 or 500 acres up in the mountains 60 miles east of here, where he drives his cattle in the summer months to graze and range there until the rainy season begins, when he returns home again. He has between 200 and 300 head of cattle and about that many hogs with, some 50 head of horses on his ranch and puts up 150 to 250 tons of hay each year. He also raises hundreds of chickens and turkeys and makes large amounts of butter while up in the mountain range with his cows and cattle. Any one that has spent a few weeks up in these mountains at "Silver Lake" where Zack Kirkwood's ranch and summer hotel is located, knows well both Zack and his good lady, who presides over the hotel at Silver Lake in the summer season. In fact to not know Zack Kirkwood in this section of the county is the exception and not the rule.

Next joining "Kirkwood's" is the large and good ranch of Mr. Raymond. This is one of the largest and best ranches and stock farms as well as wheat and barley ranches in this county. Mr. Raymond is of French descent and one of the best farmers and citizens in Amador county; he is an old "'49er," his house is large and connects with a fine wine vault and cellar, large barns and sheds for 1,500 sheep, which is his average flock. He has several hundred head of hogs and cattle, a fine vineyard of choice grapes, and a small good orchard of fruits. He has 1,300 acres here and 300 or 400 acres well up in the mountains as a sheep and cattle range, where he drives his sheep and stock each summer to graze. Mr. Raymond raises each year from 10 to 20 tons of grain of the finest quality upon his ranch.

Next to Mr. Raymond's is the large ranch of Mr. Jackamin's of 1,300 acres. He is also hay, cattle and hog ranchman and amongst our heavy farmers and hardest workers.

Next to Messrs. Kirkwood's and Jackamin's is the largest of all our ranches of about 2,000 acres. This perhaps the very best improved and worked ranch in this part of Amador County. This is owned and worked by "Italian John" (John Bellwomary). He has over 100 head of fine horses with 400 or 500 head of cattle and several hundred head of hogs. Like all the farmers hereabout, he has large summer stock ranges up in the mountains. There are five or six dwelling houses, and barns and large cattle and hay sheds, upon this fine ranch. They put up 300 or 400 tons of hay each year. James Badracco has a ranch of some 400 acres that joins Mr. Kirkwood's and "Italian John's" ranch; this is also a good ranch and Mr. Badracco put up over 100 tons of hay besides raising wheat and barley and has 100 head of good cattle, hogs, etc. upon his place. All of their farms keep chickens and turkeys, and put up butter and cheese yearly. Next is the ranch of the Messrs. Holtz, which joins with Badracco ranch and the ranch of Dr. Chambers.

Now, the reason why I have given some of these rich farms and ranches in detail, is to show Eastern monied men, who may wish to put some of their spare money or capital into these rich gold quartz mines here in little Amador county, that hay, grain, butter, beef and horses, with mutton and eggs, chickens, fruits and vegetables are here, raised and produced right at home and close to the quartz mines. All these things are here to be had from those who produce and raise them, fresh and cheap, and not at a fabulously big price, for all these articles of living must be had at and with the working of all gold or silver mines anywhere. No matter at what cost or price, they must have all these things; hence, as I before stated in these articles, the gold quartz mines and leads of little Amador county, California, can be worked at the least cost for everything, and not at the big prices that must be paid for all those articles, 1,000 miles away from civilization and farms. There are good hotels at Jackson, of which the National Hotel, owned and run by Messrs. Evans & Askey, is first-class in every respect, and second to nothing of the kind in the interior of California, and Ginochio & Bro. and others keep very heavy stocks of all kinds of goods—iron, lumber, grain, hardwood, grains, dry goods, etc., equal to any stores in the interior of California. WELLINGTON.

Arizona Mines.

The Prescott *Courier*, in speaking of the mining situation in Arizona says: Mines which have been worked are mostly copper, and as this metal has not been in great demand, we cannot say that the copper mining industry has paid very well. The Clip silver mine, of Yuma county, some mines in Mohave, the Silver King, of Pinal, the Dosoris, Lane and other mines of this county have paid well. Of gold mines but little is to be said. Gold, here, is hidden away in sulphurets which have not been successfully treated. It would take pages of this paper to give names of veins of this Territory which carry gold, silver, copper, lead and other metals. Of course no one supposes that all these veins can be made to pay. Some of them are mines; others prospects, and a great many of them no good. The mining fields of the Territory are many; they are also large. As yet but little prospecting has been done in them, so that in the good time that is coming ledges, which are now covered up, will be unearthed and prove to be the richest in the Territory. The Vulture gold mine had few, if any, equals, as a large bullion producer. Its end is not yet. We must have more capital; cheaper transportation; cheaper supplies of all kinds before we can place the Territory at the head of bullion producing States and Territories, where we firmly believe she will eventually climb. North and south railroads would enable people to pierce our mining fields; would reduce prices of living here, and of course, give an impetus to mining, the pleasing shock of which would be felt all over the Republic.

Utilizing of Waste Material.

In the beneficent economy of nature, there is nothing lost, nothing thrown away. What seems like waste is only a form of economy we do not understand. In the autumn there are tokens of decay. The flowers fade, the grass withers, the leaves fall, as though Nature was dropping her head in prayer before sleep. But we know that in the midst of all this decay there has not been a particle of waste; that not one grass-blade or leaf has lived in vain; that not one undeveloped plant or fruitless seed has been destroyed. They all slip into the hidden and mysterious receptacles of nature, and in due time come forth in new forms and use.

Man has taken the hint of economy that nature kindly gives. Within the past few years important progress has been made in the industries of the world, but nowhere has this advance been more marked than in the utilization of waste material.

From a paper read before the London Society of Arts, by P. L. Simmonds, we gather some facts which we believe will be interesting to the readers of the RURAL as an illustration of the way science is contributing to the thrift and domestic economy of the world. The beautiful aniline dyes produced from the tar of gas works and the sugar from beet root are noteworthy examples of the utilization of what was once thrown away. The wool manufactures of nearly all countries now use up cuttings of cloth and shreds of all kinds which were not long since swept out and burned as useless, and the strippings and refuse of cording are now considered next in value to pure wool, and contribute no mean sum to the nation's wealth. Silk waste, which at one time was thought to be of no value, is now converted into a material called floss silk. By silk waste is meant the outside and inside husks of the cocoons, pierced cocoons that have been eaten through by the moths, and in fact every portion of silk that is not available for working up into fine silk fabrics or thread. The refuse of tanneries, which consists of untanned dried pelt or glue pieces, fleshings, hair, lime deposit and spent tan, is now profitably utilized. Ordinary size is made from the refuse of the hide and is used by paper hangers, cotton spinners and carpet manufacturers. The so-called cheap sealskin leather is made from common plasterer's hair—of that obtained from the tan-pits. Cardboard, printing paper and roofing boards are made of the waste bark from the tanneries. Artificial leather, made from leather scraps, is extensively used. A valuable article in the shape of a new black is obtained from the same source, and is largely used in the manufacture of printing ink, dark pigments and blacking, taking the place of bone-black, and is sold at one-third of the price.

The blood from slaughter-houses is now made into blood albumen, and the drainings and clots go for fertilizers. Among the animal substances now utilized are many species of fish skins, alligator, crocodile, and even snake skins, which are tanned and made into innumerable articles of every-day use. Of the vegetable substances, none are more commonly used than those which enter into the composition of paper. Wood of long fiber, bamboo, cactus, esparto grass, the butt ends of jute, the refuse stalks of the sugar cane, the husks of oats, barley, rye and rice, are all used for this purpose. The waste paper of Government offices and the spoiled impressions in printing establishments, which were once the perquisite of messengers and office boys, are no longer considered beneath the notice of the Government or the richest publisher, since it has been discovered that they may be remade into very good paper and used again.

It is only since 1860 that the extraction of oil from cotton seed has become a commercial staple. The oil and oil-cake is now often of more value to the planter than the cotton fiber. Glucose is a new use for maize, which was discovered in 1867. Since that time its manufacture has steadily increased, until now it is stated by the New York Chamber of Commerce that its production in the United States is not less than 1,000 tons a day; but many of the uses made of this material are decidedly objectionable. Corn cobs are found to contain potash, and by the aid of chemistry promise to become a new mine of wealth. It is only 20 years since glycerine, a by-product in the manufacture of soap and candles, was considered worthless; now it would be difficult to enumerate all the uses to which it is applied.

Among the items of mineral waste now made use of is the tin dust, which is really the scum from the tin pot, and which is now separated from the waste and used for button making and various other purposes. Pyrites, formerly a neglected mineral, is now made to yield sulphur. The waste of glass furnaces is used again, serving a purpose in the manufacture of glass, similar to rags in paper making. Broken bottles, though when remelted make an inferior quality of glass, still it is used for many purposes and finds a ready market. It is also made into cheap jewelry, mantel ornaments, and the like. The utilization of slag from blast furnaces is not new. It has long been used for road making, but science has found a way to convert it into bricks and other useful building material. It is also applied to the manufacture of artificial stone and molded into chimney pieces, window-heads, balustrades, and outside ornamental work generally. It is also used in making mortar, cement and concrete. Another application is the manufacture of slag-wool. By the action of strong jets of steam, the slag is transformed into a fibrous, whitish silicate cotton, which, being mineral, is incombustible, like asbestos, and is now extensively used in the construction of new houses with mansard roofs, the space between the interior lath or paneling, and the exterior covering of zinc, slate or tin, being filled with this slag-wool, which protects from the rigor of frost in the winter and intense heat of the summer. If in winter taps and spouts and water-pipes are covered with this slag-wool, it prevents freezing and bursting, and is going extensively into use in cold climates, to the great discomfiture of the plumber's business.

The Silver King.

In our annual mining review last week, reference was made to the famous Silver King mine, in Arizona. The facilities at this mine are being extended. During the last year the surface improvements at the mine have been as follows: The erection of a small store-house for iron and steel; the extension of blacksmith shop 15 feet; the widening of engine-house 11 feet, for new machinery; the construction of a new entrance road to the premises for the ore teams; and the reconstruction of the engine-room which contains the engine furnishing power to the shops. Two new 54 inch by 16 feet steel boilers, supplying 100 horse-power additional power, have been set up adjoining an old steel boiler of the same dimensions, thus giving in the battery of three, nominally 150 horse-power, and at present steam requirements allowing a relief boiler to contend with the scaling water. A single 18 by 30-inch Ingersoll air compressor has been set in place, and furnishes power for seven air drills in the mine, and at the same time additional ventilation, while its capacity is sufficient to run three or four more air drills, or a diamond drill of about 15 horse-power.

As this is a representative Arizona silver mine, some of the details of the operations of last year will be of interest. We take this from official reports:

The consumption of cord wood at the mine was 1,303 cords, costing $12,297. The average consumption the first six months of the year was 2 3-10 cords per day, while that of the last six months has been 4 82-100 cords per day, the increased rate being due to the increased steam requirements. On the first of August the price was reduced $1 per cord.

The improvements during the year at the Company's mill have been the introduction of the Brush and Swan systems of electric lighting, the former with excellent results; the erection of a substantial masonry pump house over the 6-inch drilled well, to replace the one destroyed by last winter's flood, the construction of a low masonry dam, 80 feet long, across Queen creek, that advantage may be had of all the water that flows in the bed of that stream.

The amount of ore hauled to the mill was 20,570 tons, and the year opened with a reserve in the mill yard. The total amount of ore crushed was 22,342 tons, which has yielded 51 shipments of concentrations, averaging about 11½ tons each, and aggregating 577 98-100 tons. The ore shipped was about 2 59-100 per cent of that crushed, the charge in this ratio being due to the character of ore met with in certain parts of the 700 level in the early months of the year. The average assay of the ore, as per daily assays, was $43 12, and that of the tailings, similarly obtained, was $5.65. Of the silver contents of the concentration, 50 9 10 per cent was in the form of ductile or native silver, and 49 1-10 per cent, as contained silver in the various argentiferous minerals. The consumption of cord wood at the mill averaged 6 1-10 cords per day, at a cost of $9 per cord.

In the early part of last May, the milling facilities were increased by leasing the five-stamp amalgamating mill of the Windsor Con. Mining Co. Since then the mill has been run on our quartzose-haratic ore, of which we have large quantities in the 500, 600 and 700 levels of the mine, and which cannot be advantageously concentrated. The ore is dry-crushed, roast-chloridized and amalgamated. Eighteen hundred and nine and sixty-two one-hundredths tons have been crushed and treated, having an average value of $46.38 per ton. The average value of the tailings to the close of the year was $9.33, but up to the fore part of December was much less than that figure, the proportionate increase being due to mechanical causes, chiefly the inability to set new mullers and shoes in the pans on account of delays in freighting from bad roads. The chlorination is satisfactorily effected with 2¾ per cent of salt, and the average consumption of quicksilver per ton of ore treated was 1 32-100 pounds. The consumption of cord wood is four cords per day, at $9 per cord. The chloridized ore is readily amalgamated, and the process of treatment has worked satisfactorily, and can be applied successfully to any class of ore at present known to exist in our reserves in the mine.

MECHANICAL PROGRESS.

The Age of Steel.

Wonderful progress has been made of late in the adaptation of Bessemer steel to uses to which iron only was considered applicable. At the office of the North Chicago Rolling Mill company was recently shown specimens of steel wrought into several shapes requiring great ductility—bars of various dimensions twisted into coils, and even fine wire spun out of the product of the same furnace from which come the inflexible steel bars of our railway tracks.

Steel Tacks.

The substitution of steel for iron in the manufacture of nails and tacks is regarded with much interest, the claim being made by some that it is likely to revolutionize the manufacture of tacks as well as nails. The American Tack Company, Fairhaven, Mass., have commenced the manufacture of the steel carpet tacks, for which claims are made as a superior article, having advantages over the common iron carpet tacks. It is claimed that the steel tacks will not cripple in driving, and, on account of the toughness of the material, that the heads will not come off when drawn out. They are sold at 37½ cents per dozen papers for Blued, and 50 cents per dozen papers for Tinned, subject to the usual cash discount, making the net cost less than 1½ cents a paper at wholesale.

The Age of Iron

Is fast giving place to the age of steel. Science and inventive genius have found how to diminish the cost and at the same time increase the durability of many manufactured forms by substituting the rapid process of Bessemer for the slow operation of puddling by hand.

A Foolish Opposition.

The puddlers, who have, on account of the difficulty and toilsome nature of their art, long controlled the price of their labor and thus regulated the price of iron, have taken alarm at the rapid inroads of steel, and are endeavoring to "boycott" manufacturers and purchasers into the production and use of iron made by the old method. This is short-sighted and unwise. If steel is better than iron for various uses it will surely take its place, and no industrial combination can prevent it. But the progress of the inventive arts has never resulted in reducing the general demand for labor. On the contrary, it has greatly stimulated it by creating new wants and organizing new industries to meet them. The drivers of stage coaches fifty years ago saw ruin impending if the steam locomotive was introduced, but the locomotive came nevertheless, and the railways of England now employ a great army of workers, and have vastly increased the opportunities for employment opened to the laboring man. If the puddling process is to become obsolete, work of a better, less exhausting and more satisfactory nature will take its place. There will still be bread enough for all industrious men, and occupations by which to obtain it. But labor combinations cannot hold back the car of industrial and scientific improvement.

A PAPER MAN-OF-WAR.—It could hardly be credited that there is already in existence paper men-of-war of large tonnage. A few years ago, says a correspondent of the *American Queen*, I was on board the British man-of-war, the Raleigh, which was cruising in East Indian waters. Pointing to the substantial-looking wooden walls of the vessel, a midshipman asked me one day if I knew what those were made of. I answered that probably they were made of teak or oak, and was considerably surprised when he laughed and told me I was all at sea in more senses than one. "The hull of the Raleigh," he said, "is really paper hydraulically pressed. Paper walls, in place of the famous wooden walls of England that the poets sing about, were adopted by the admiralty a few years ago as an experiment on a few men-of-war. This is one of them that you are now sailing in through the Indian Ocean." The paper hull idea, as applied to men-of-war, is a good one, at least in theory. In the old wooden and iron ships, men were more exposed to danger from splinters than direct missiles. Now, paper hulls would at least do away with splintering. A shot might hit a vessel and pass right through its side, but the hole would be a clean one, and there would be no splinters until the missile encountered some of the internal machinery and compartments. I do not know whether the English Government has built many of these angular paper boats, but it had one of them at least, in the shape of the Raleigh.

A NEW CONSUMPTION FOR STEEL.—The working of sheet steel into forms or shapes in the United States is comparatively new and but little understood. A short time since Mr. Brown, of Brown & Brothers, interested a large and enterprising steel producer of the west to make uniform and ductile metal that could be wrought cold like copper, into seamless shells, cylinders, boilers and tubes, which in cost compare favorably with riveted galvanized-iron work. For receivers of all kinds, where hard usage is to be expected, and for steam and kitchen boilers, where strength and durability are demanded, they are said to be perfection. The riveted house-range boiler is an instance of a construction in which constant expansion and contraction soon work destruction by leakage, and which only stands a hydraulic pressure of 180 pounds. A seamless-steel boiler is not affected by expansion or contraction, stands a hydraulic pressure of 600 pounds, and is smooth and symmetrical in form and finish. The steel is protected against oxidation by a new treatment, by which a white alloy is distributed over the surface. The new product is called "silvercid steel."

CHIMNEYS.—A soundly-built chimney vibrates, or swings from side to side, as a whole, under sudden and violent shocks of wind, and is in reality safer when it does so than when it stands in sullen and unmoved resistance. The vibration indicates that the several constituent parts of the structure are firmly compacted into one coherent, continuous, and, as it were, homogeneous mass, which can sway from side to side like a steel rod or spring, without any tendency to dissolve its continuity and break asunder at some intermediate point. The absence of vibration, on the other hand, means that there is not this integrity of cohereace, and that there are, so to speak, fissures of substantial continuity in the structure, at which disruptive strain is unavoidably developed. Sudden shocks of wind bursting upon lofty columns of brick-work in such circumstances tend to break them across at the joints where the interruption of continuity occurs. The movements of vibration are there absorbed, and converted into the less desirable condition of molecular strain.

PRIZES FOR INVENTORS.—A member of the French Legislature has proposed a prize of $1,000 each for the best essays by inventors on several important subjects, to which a good deal of attention has already been paid in Europe, as well as here. One of these prizes is to be for a practical method of producing aluminum at a low cost, a field in which many times the proposed prize has been expended, and which has been the object of special research by eminent scientists. All but one of the systems for its production now require the use of sodium, itself an expensive metal, and the Jablochkoff system for its production by electricity is also costly. Another proposed subject of one of the prizes is a simple small motive power, for this best style of which so many inventors have long been striving. The individual who should succeed in obtaining the results desired by this "generous" offer would hardly be liberal enough to donate it to the world for the prize offered, so long as the patent laws, in France, as well as here, would render his discovery worth many hundred, if not many thousand times more.

PHOSPHORIZING WIRE.—A method of phosphorizing bronze or brass wire followed by some manufacturers is the following: The wire is put in a solution of from one-eighth to 5 per cent of phosphorus in either, bi-sulphide of carbon or olive oil, 5 to 10 per cent of sulphuric acid and 85 to 95 per cent of water. In this bath the wire remains till the metal begins to take up the phosphorus. The wire is then drawn to one number finer and placed in a closed retort with a thin layer of phosphorous, so that the phosphorous vapor may spread over the surface of the wire. After this the wire is packed in charcoal, which is kindled, and after proper annealing the wire is again drawn to a finer number. This process is repeated till the required fineness is obtained. Wire so phosphorized is very tough, takes a high polish and does not easily corrode.

THE REPUTATION OF AMERICAN machinery has not only been sustained in recent years but has been extended to remote parts of the world. The Philadelphia *Press* says that a prospector sent out some months ago by the Russian Government with the object of gaining information relative to mines and mining to be made available in the working of the mines of Siberia, has, after visiting many mining districts in this country and Europe, advised his government to purchase American machinery and to adopt a very large number of the improvements in which, he says, American miners excel. The machinery purchased will be shipped from San Francisco to the mouth of the Amoor river, from whence it will be transported an average distance of 2,000 miles into the interior of Siberia.

UNDERGROUND SHAFTING.—The transmission of power by underground shafting is a system which is steadily increasing in public estimation. In several new industrial enterprises in this country the system is employed. At Pullman, Ill., a shaft of sufficient size, geared to the shaft of the celebrated Corliss engine is laid in substantial masonry, extending northward and southward from the engine, and having gear at desired distances to transmit power to right-angled shafts as required. The Allen paper car-wheel works 1,000 feet north of the Corliss engine, are run in this way, as is the machine and blacksmith shop, while the shaft running eastward from the main shaft runs the immense pumps for the water works and to drive away the sewage.

PRESSED GLASS.—It is stated that pressed glass is turned out in the Siemens works, that is hard and tough as cast iron. It is far lighter and not affected by temperature, etc. It is intended to make out of this hard crystal, street lamp posts, stairs and gas and water pipes. It is thought these articles can be made 30 per cent cheaper than in cast iron, but will not, of course, be so heavy.

SCIENTIFIC PROGRESS.

The Waking Power.

An old problem of the psychologists has been revived by a letter to *La Nature*, written by a French business man who mentions that for years he has been in the habit of waking himself at any hour in the morning that he wished, simply by impressing upon his mind before going to sleep the fact that he must awake at that hour, and saying further that he seldom varies five minutes from this moment which he has assigned himself. The writer referred to says: We have a very distinct recollection of many instances in which we have ourselves tried the experiment with success, and at one time when it was necessary for a considerable period for us to wake on certain days of the week at a very early hour, to take the first train to the place where our services were then needed, we had an opportunity of studying the circumstances under which this peculiar species of self-control is most easily exercised.

Whatever part of our mind it might have been that took charge of waking us seemed to begin its count of the hours from this time at which we composed ourselves to sleep, and if we did not inform ourselves of this our conscious reckoning was correspondingly uncertain, and the effort to wake vague, but if we took a clear note of the time in the evening we could sleep peacefully through the whole of the allotted interval, sure of being aroused at or near its expiration.

Another condition of waking we found to be the occurrence of some small external event, through which, as it were, the internal effort could take effect upon our senses. A very trifling circumstance—the flutter of a leaf outside the window, the chirp of a bird or any other of the unnumbered sounds of early morning—was sufficient, if it happened at the right time, to wake us by a sort of magnifying process which at that moment gave the power of starting up by a noise which would at other times be unnoticed; but without such sensible impression we think we should not have waked. In fact, on one or two occasions we remember to have been impressed with a dim consciousness of waiting for something to happen before waking, and a moment later a trifling sound would open our senses with a little shock. To the necessity of waiting for this impression, small as it might be, we were disposed to attribute the variation of a minute or two, either way from the exact moment assigned for waking, which might otherwise be kept with exact punctuality.

Electricity in Cotton Mills.

One of the most formidable foes the cotton spinner has to contend with in working cotton fiber is electricity, which is generated with fearful rapidity in dry frosty weather in all parts of a cotton mill, by the friction of machinery and belts. This is especially the case on a dry November day, rather cool, with the wind ranging from north to northwest, when the electricity is very active and mischievous on cotton fiber.

In the process of spinning, when carefully observed with a magnifying glass, the fibers will be seen to be drawn out at right angles from the cotton, if in the process of drawing, and from the thread, if in the process of opening. These fibers are constantly swinging off at every conceivable angle, giving the thread of warp yarn a rough woolly surface, much like mule filling spun from a low grade of cotton, in which a short staple of cotton predominated.

These facts show most conclusively the importance of placing all drawing, roving and warp-spinning machinery in the most favorable positions, away from the influences of electricity. Careful experiments made to determine the injury wrought upon work by the influence of electricity, when no means are taken to draw it away, show a deterioration of from 4 to 5 per cent in strength of thread.

The *Textile Record*, from which we condense the above, says: With 65 per cent of moisture in the air and the temperature at about 75°, and with a northeast wind, the spinning and weaving in most of the New England mills will generally be found running well, provided the quality of the cotton and all other things are properly adapted to the numbers of the yarn spun.

Good electric-conducting insulated wires to convey the currents to the ground are essential to success in controlling the silent, subtle fluid, and in this way to destroy the bad effects of electricity on the quality of the work in cotton mills, without the serious objections to the use of cold vapor or hot steam in the rooms. Care should be exercised, in conveying the electricity to the ground, to have an unbroken connection of metal to the ground, so that the current shall not be severed. If the conducting wires are attached to sprinkler pipes, care should be taken to file off any rust or paint, so that the connection shall be made with clean polished surfaces of the wire and pipe together.

THE COLOR OF OZONE.—MM. Hautefeuille and Chappuis, have found that ozone is a blue gas, the color appearing sky-blue even when only so much ozone is present as is obtained in the ozonation of the oxygen contained in a tube a meter in length by the silent discharge. Furthermore, they found that under very great pressures the condensed gas became indigo blue. If the pressure is increased to 75 atmospheres, and then suddenly relieved, a dense, white cloud is formed, showing the beginning of liquefaction, while the same phenomenon does not take place with pure oxygen until a pressure of 300 atmospheres is attained. The ozone must be compressed slowly and with constant cooling, otherwise it will explode with evolution of heat and light. By mixing the ozone with carbon dioxide, and then submitting this mixture to great cold and pressure, Hautefeuille and Chappuis succeeded in obtaining a deep-blue liquid, the blue color being due to the liquified ozone. The same observers have studied the absorption spectrum of ozone, and accurate measurements of the same have been made by W. N. Hartley. The latter has extended this research to the absorption of certain parts of the sun's rays by atmospheric ozone. By this new optical method, he has arrived at the conclusions: (1) That ozone is a constant constituent of the upper atmosphere. (2) That it is present in larger amounts in the upper than in the lower part of the earth's atmosphere. (3) That it is the cause of the blue color of the sky.

RAIN WATER.—There is a notable difference in the character of rain water, even between the time in which it condenses into drops in the clouds and that of its reaching the earth. A cotemporary says: "The water which alights as rain is not the same as the water which existed in the cloud. That we must imagine to have been pure water, as it was when present as an invisible gas in the midst of the clear, blue air. This has already picked up many foreign ingredients also present in the air, through which the falling shower has passed. Like the mineral cloud in the midst of the glacier river, it has carried down with it all it could—more, indeed, than is possible for a cloud of mere triturated rock, like that which the Rhone brings down to the Lake of Geneva; for the rain drops possess not only the power of surface attraction, which is all that particles of rock exert—they are also solvents, and will take into solution all that is soluble in the air through which they pass. The air contains many soluble substances beside itself. All life, and still more death and decay, is always filling it with foreign substances which are soluble in water. Carbonic acid, the product both of respiration, and of putrefaction, is largely present in it. Ammonia is present in it. Nitric acid is present in it. Even the chlorine of common salt, thanks to our nearness to the sea, is present in it. The rain dissolves, absorbs and carries down all these things."

SCIENCE APPLIED TO PAINTINGS.—A new method of painting, or rather an old one, has been recently revived by an English painter and a French chemist, by which new paintings are made to exactly resemble old ones. The material used is colored wax, which is melted in metal palettes and put on the panel with a stiff brush. Then comes the really artistic part of the work, which is done with heated irons of peculiar form, copied from a recent discovery of old tools used by the ancients for the purpose, by which horn is blended with stone, and wonderfully rich and delicate effects are produced. That these wax paintings are permanent is sufficiently proved by the encaustic paintings which are preserved in the Louvre and the British Museum.

ALUMINUM FOIL.—Beaten aluminum leaf may now be obtained in books like silver leaf, and is largely used instead of silver for decorative purposes. Mr. Levison suggests heavy aluminum leaf as a substitute for tin-foil for coating Leyden jars and similar electrical apparatus. Area for area, it does not cost much more, is much lighter and permanently retains its polish. A book of 50 leaves of aluminum, of the ordinary thickness, costs 25 cents; of a thickness suitable for Leyden jars, 50 leaves, about 4 inches square, costs $1.

TELLURIC CURRENTS.—M. E. C. Blavier has brought before the Academy of Sciences a paper on "Telluric Currents." He shows that the variations of terrestrial magnetism are due to electric currents which circulate in the atmosphere at a greater or less distance from the ground, and the circuit of which is completed either directly when they encircle the entire globe or by the intervention of the earth, but at a depth sufficiently great to have no action on the magnetic needle.

THE HEAT OF THE SUN.—In the focus of a burning-glass the sun's rays will melt the most refractory substances. The heat, then, of the sun is most intense. If we were as near the sun as we are to the moon, the whole solid earth would melt away as wax. Were the sun surrounded by a coat of ice 50 miles thick, it would all be melted in one minute's time. One acre of the sun's heat supplies energy sufficient, if it were available, to run all the steam engines on the earth.

QUININE SUBSTITUTE FROM COAL.—A chemist in Munich has, it is stated, succeeded in obtaining from distilled coal a white crystalline powder, which, as far as regards its action on the human system, cannot be distinguished from quinine, except that it assimilates even more readily with the stomach. Its efficiency in reducing fever heat is represented as quite remarkable.

Passing Events.

The silver miners of the coast are now anxious to see what the result of the recent "silver convention" will he. The Denver convention finished its labors and adjourned *sine die*. We give elsewhere in thie numher of the PRESS the resolutions adopted. A convention was also held laet week at Carson, Nevada, when resolutions of a similar tenor were passed.

The low prices of lead and copper are having a bad effcct on mines in Montana, Arizona and Utah. The copper minere are in daily hopes that the market for their product will grow hetter. A movement is on foot hy an eastern syndicate to get possession of the great Montana copper mines, in which case, no douht, production will he restricted in hope of hettering prices.

Prospectors are lookiog forward eagerly to the openiog of epring, so that they may start out into the mountains again.

The Government has advised explorations of certain Alaskan rivers, and it may he that this will result in the finding of some new diggings, the regions in question never having heen prospected.

A BILL has been introduced into the Nevada Legislature for the organization of a State Mining Bureau, and calling for an appropriation of $1,000 for that purpose. Senator Smith, of Lander county, has introduced a hill into the Senate to reduce the maximum rate of fare over all roads in Nevada to five cents per mile.

TIN is said to have heen discovered in Ten Mile District, near Helena, M. T.

Copper in 1884.

The gradral hut very marked decrease in the price of copper during the year 1884, which was mainly dne to the greatly increased production of the United States, has had a depressing effect on copper mining in this country. The comparatively new coppsr producing regions of Montana and Arizona feel the depression most, as they are distant from the central copper markets and pay high freight rates. So low has the price been reduced that some of the mines will have to shut down until prices improve; the cost of production heing now harely paid at ruling market rates. The Lake Superior companies are trying to force the Montana and Arizona mines to diminish their production, and to this end recently made heavy contracts for delivery during the next five months, the purchasers heing precluded from supplying themselves with other American copper. The Arizona and Montana mines must necessarily export to Europe ths hulk of their product, where it must compete with that from Chile, formerly the largest copper producing region of the world, hut now second to the United States.

It is very gratifying to nots that the United States is now in a position, as far as copper production is concerned, to rule the markets, though we etill look to England to establish prices. For many years Chile has heen the greatest copper producer of the world, hut for the past two years America has taken the position, and will probahly keep it. It will he interesting to note our gradual growth in this respect as compared with Chile. The latter country exports practically all her copper, while we use a great deal of ours at home, so hy comparing the Chile exports to all countries with American production we can get at fair average results. The figures appended to shows the relative growth, therefore represent Chile exports and American product in tons fine.

Years.	Chil Tons.	United States. Tons.
1876.....	50,912	19,[illegible]
1877.....	45,562	23,000
1878.....	46,931	21,500
1879.....	49,560	23,000
1880.....	43,135	27,000
1881.....	38,160	32,000
1882.....	43,129	40,913
1883.....	41,229	52,000
18[illegible].....	43,700	70,000

The product of Chile and United States for 1884 is estimated. It will be seen that siocc the Arizona and Montaoa mines hegan producing, our copper product in this country has heen wonderfully increased, and that these mines have gained for us the leading position of all copper producing countries of the world.

In the annual review of the MINING AND SCIENTIFIC PRESS, January 24th, we gave the statistics of the copper production of Arizona and Montana. California only produces about 1,000 tons a year, so its product cuts a small figure in the general result. Nevada has plenty of copper, hut there is now small encouragement to develop her mioes.

We are on this coaet, in the matter of copper, largely interested in the English market, and the London and Liverpool prices, give the general hasis of value. During the last two years Chile bare ran down from £65.105 in January, 1883, to £45.55 in Decemher, 1884. Our American product hss greatly affected that market. We only shipped to England 4,000 tons of copper in 1884, and 17,000 tons in 1883, while in 1884 we sent over 28,000. This, of course, kept prices down.

There is this to he considered, however. The consumption of copper in England was 10,700 tone greater in 1884 than in 1883, large as it then was, and this taking place in the face of the general dullness of trade, the diminution of ship huilding hy nearly one-half the average of the previous three years, which was a million of tons. It can only be accounted for hy the extended use of hrass for domestic and ornamental purposes, and the application of copper in the place of other metals, as the natural resnlt of decreased co[illegible]. The export from England was last year 5,300 tons less than in the previous one. In France, the consumption has heen 3,000 tons less than in 1883. The importatiou of copper into England, which in 1883 exceeded that of 1882 by 9,500 tons, increased last year 10,700 tons over 1883. This latter increase was made up of 3,000 tons from Chile 7,900 tons from the United States, 1,100 tons from Australia, 400 tons from Cape of Good Hope and 200 tons from Italy; while the supplies from Spain (including pyrites) decreased 2,600 tons, from Newfoundland 1,000 tons, and from Quebrado 300 tons. Some 5,000 tons Chile hars were imported into France, but 2,750 tons more ingots and slahs were imported from the United States, which was a point gained for our copper miners. Moreover, ahout 3,000 tons of fine copper in the form of ingots, slahs and matte were shipped from the United States to other parts of the continent, and 850 tons of copper from Chile went direct to Germany.

Rather a curious fact is, that the consumption of copper in England and France exceeded the importations hy 2,000 tons, yet prices declined. James Lewis & Sons, the Liverpool copper dealers, attrihute this partly to the prevailing despondency arising from dull trade, hut more especially to the announcement in advance of increased production of ons Montana mine, and of an intended increase from the Rio Tiuto and Quchrado mines, to compensate for dimioished value; also to the mode lately adopted of selling large quantities of ore matte and other copper, on the hasis of Chili hars at the time of delivsry. It is not that the copper production of the world has heen excessive during the past year; on the contrary it shows a reduction, hut the rumors prevalent concerning, and the uncertainty of the prodnction of American mines, have kept the market in a state of douht, advantage of which was taken by speculators to depress values.

Profits of Hydraulic Mining.

In the late legal proceedings against the hydraulic miners, it wae attempted hy their opponente to show that this brench of mining had, as a general thing, proved unprofiteble, a good deal of the testimony adduced on the part of the plaintiffs heiog designed to establish the affirmative of that proposition. Whatever may seem to have heen the weight of testimony hearing on that point, as hrought out during these triale, certain it is, no kind of mining, either here or elsewhere, has paid better on the whole than this. For 15 or 20 years large numhers of miners engaged in hydraulic operatioos, made good wages, washing the top stratum of gravel, which, heing loose and free from pipe clay and large boulders, could he run off with comparatively little water, nor was much capital then required to open up and outfit their claims.

Gradually as this top gravel came to he disposed of, difficulties of various kinds developed themselves in connection with this class of operations, some of them so serious as to necessitate the employment of much engineering skill and the expenditure of large sums of money. Thus, long ditches had to he constructed over rugged districts of country; enormous reservoirs had to he huilt at great elevations io the mountains, costly hed-rock tunnels had to he driven and ao expensive and powerful plant provided for washing purposes. In short, the whole hnsiness had to he reconstructed, learned anew and conducted on a gigantic scale. But there were found men of skill, nerve and large means ready to undertake the difficult task, which, in good time, was well accomplished.. During these years of heavy expenditure, constructioo and trial there inured to the investors, as a matter of course, no very large net revenues. Nevertheless, not more than a few of these enterprises failed to be self sustaining, nor were many of them without some profits from the start.

But just when this enlarged system of hydraulic mining had, through such persevering effort and the expenditure of enormous sums of money, heen hrought to perfection, and the investors had begun to reap the reward of their costly and hazardous ventures, the courts interpose and put a stop to further operations, inflicting terrible loss on the owners of these properties and involving many of them in irretrievable ruin. To call io question the profitahleness of hydraulic mining under circumstances like these is alike ridiculous and unjust. So far as the husiness has heen permitted to go on unmolested it has proved not only remunerative, hut extremely profitahle, though stricken down just as it was escaping from its hurdens and embarrassments and entering upon an era of assured success. Whether hydraulic mining ehall be suffered to go on in the districts where it has been partially estopped or not, one thing is certain: It will be prosecuted very actively hereafter in those sections of the State where it has not heen interfered with, more especially along the Klamath river and some of its trihutaries, whers, hy reason of the favorahle conditions that there exist, it seems destined to undergo a rapid expansion. This industry is not deed, nor yet even crippled in more than a portion of the State, this northern field heing not only well conditioned, hut quite extensive. It has openings for cepital that are worth looking after.

New Quartz Crushing Device.

Aaron G. and James M. Dyer, of this city, have patented, through the MINING AND SCIENTIFIC PRESS Patent Agency an improved form of quartz crusher, which, though very simple in construction and operation, possesses some peculiar features. The receiving and crushing chamher is cylindrical in shape, the ore coming in at the top opening. This receiver is olossd at one end, made hsavy and strong, and is supported on a shaft above the line of the shaft carrying the crushing cylinder, which is inside the receiver. The receiver is lined with removahle dies. A shaft extends out horizontally from the closed end, turns in suitahls boxes and supports the receiver, to which it is eccentrically secured.

From the closed end of the receiver an arm extends upward and forme a lever to which power is communicated to oscillate the receiver to and fro. This movement will hring the sides of the receiver in closer contact with the interior cylinder, and thereby reduce the rock, which moves downward between the two at each oscillation. Power is easily applied to move the parts.

The cylinder in the receiver is of sufficient length to just fit hetween the ende of the receiver, and considerahly smaller than its inside diameter. This cylinder has a shell or cruehing shoe, made removahle in case of wear. The cylinder has a shaft extending out through the open and of the receiver, opposite the other shaft, but at a point somewhat lower down. The two shafts are not in line, but mounted eccentrically with respect to each other.

The cylinder-shaft is in hoxes so it and the cylinder are free to turn, and the receiver has an opening in its lower part through which the crushed material may escape. A flange is fitted to the end of the cylinder next to the open end of the receiver, and prevents the escape of material at that point. The exterior of the cylinder lies so close to the hottom of the receiver as to determine the eize of the particles which may pass hetween the two, and the space on each side of the central point gradually widen toward the top of the receiver. The hearinge of the shafte are vertically adjustahle so ae to regulate the distance between cylinder and receiver to such degree of fineness of pulp required.

The operation of the device is as follows: Ore being fed into the receiver will lie on each side of and ahove the internal cylinder, and when the receiver is oscillated the material hecomes wedged between the sides of the cylinder and receiver, and as the receiver moves hack and forth the cylinder is caused to rotate in the same direction hy the wedging of the rock hetween the two, and as the rock passes downward it goes ioto a narrower and narrower space and is crushed. The rock on the opposite side will slip down into the widening space on that side, to become in turn wedged between the cylinder and receiver and carried down and crushed hy the return oscillation of the receiver. The rock is thus gradually carried down and crushed until it reaches the narrowest epace heneath the cylinder, from which it escapes through the discharge opening. By this apparatus Messrs. Dyer are eoahled to gradually reduce rock or other material from large pieces to a considerable fineness, so so that little or no further crushing operation will he necessary.

OWING to the heavy cost of mining and the large discount on eilver the managers of the principal mines in Tuscarora district find it impossihle to pay the present wages to miners and other employes, and have determined to reduce them.

ALL hands have heen discharged at the Oshiston shaft, on the Comstock. Everything connected with the mine was put in good condition previous to the ehutting down, and work can be resumed at a moment's notice.

Fire Insurance on the Pacific Coast.

In those days of enterprise and development, when it is desirable to throw every possible safeguard around the work undertaken, insurance is found to be intimately associated with nearly every branch of industry and commerce. To such an extent is this the case that it has passed into a truism that "That business which it does not 'pay' to insure will not 'pay' to run." The miner who cannot "afford" to insure his mill is not certainly in such a condition of wealth as to "afford" to add to his other ventures the chance of said mill being destroyed by fire. The farmer who cannot "afford" to insure his grain in warehouse certainly cannot "afford" to risk the destruction of the entire season's product by fire, and the wheat grower who cannot "afford" to insure his standing crop certainly cannot "afford" to raise it. In all of these cases if the owner of the property is so poor, or if his business yields such meager returns that he feels that he cannot spare the money wherewith to pay a premium which will secure him against a possibly overwhelming disaster, he can with but a sorry show of logic argue that he is able to carry the chances of such disaster on his own shoulders. Insurance is, in these days, as much an accessory to the business of the miner and farmer, as is the improved vanner and rock crusher in the one case and perfected agricultural machinery in the other. This being the case, we feel that our readers will be interested in learning more about the business of fire insurance as conducted on this coast.

In the early days it was impossible to obtain any insurance on the Pacific Slope, and many a man was impoverished by the destructive fires which occured at that time. Within eighteen months, embracing the year 1850 and portions of 1849 and 1851, the citizens of San Francisco alone lost sixteen millions of dollars by fire. In 1852 the first insurance agency was established on the Coast, in 1868 the number of companies represented had increased to twenty-one, while now it is nearly one hundred. These companies pay out to our citizens annually two and one-half million dollars for losses.

With one or two exceptions these companies have their home offices or general agencies in San Francisco, and, as is the case with other classes of business, they colonize together. What Wall street is to the financial interests of New York, California street is to the insurance interests of this Coast. We have had prepared an excellent engraving, which gives a correct idea of this portion of the city. The building with the clock tower, is the Merchants' Exchange, (now owned by the Produce Exchange) while the most prominent feature of the engraving is the new and elegant building of the Fireman's Fund Insurance Company. While all the buildings shown in the picture contain underwriting agencies the southwest corner of California and Sansome streets, on which the Fireman's Fund building is located, is distinctively known as the insurance center of San Francisco. Twelve insurance companies have their offices in this building, and it also contains the rooms of the Insurance Commissioner of the State of California, as well as those of the Board of Underwriters and the Pacific Insurance Union, so that first or last, every company on the coast must come to this "center" in the course of the transaction of its business. The building is provided with elevator, electric bells, speaking tubes and all the latest improvements.

The principal office therein is the one on the main floor, which is occupied by the corporation owning the building, the Fireman's Fund Insurance Co. This insurance office is the largest in area as the company is the largest in size of any on the Pacific Coast. It is, in fact, found necessary to connect the several desks by a series of telegraph wires and speaking tubes, in order to expedite the immense business which is transacted here. The reader may get some idea of the amount of this business when we state that the company has 1,500 agencies scattered throughout the United States; that its gross premiums amount to about $1,000,000 per annum; that it pays an average of two losses per day; and that the "home office" above referred to is the spot at which all this business is concentrated. Since its organization, 22 years ago, the company has paid $6,000,000 for losses, $813,766 of which was for losses in the great Chicago, Boston and Virginia City fires. Our farmer friends will be particularly interested in knowing that the Fireman's Fund was one of the pioneers in that branch of underwriting known as "growing crop insurance." Its experience has enabled it not only to perfect a very popular and easily understood form of crop policy, but also to adjust in an equitable and prompt manner all losses that may occur.

From the foregoing remarks it will be easily understood that the Fireman's Fund building is not looked upon as the insurance center of San Francisco solely by reason of its location. Although every fire insurance office in the city is within one block of it, to the north, south, east or west, the standing of the company itself has much to do with the prominence which attaches to the location. With assets of over one and a half million dollars, it affords to policy-holders more than three dollars, in the shape of security for every dollar of liability (present and prospective) which it owes to them, and is the leading, as it has for years been the largest Pacific Coast company. It is, in fact, the largest company organized, west of New York State.

When a company affording such solid indemnity can also lay claim to patronage, on account of keeping its money at home, helping the State by way of taxes paid, and helping its citizens by reason of money loaned, it should certainly be entitled to a continuance of the favor, which has been bestowed upon it in the past. The conservative management of the company is shown by the fact that, although it does the largest business on the Pacific Coast of any company, American or foreign, it has at risk in San Francisco, in proportion to its assets, less than one-third the average amount carried by other "local" companies.

Another point not to be lost sight of is, that in event of loss, the assured deal directly with the company, thus securing a promptness and freedom from "red tape" and circumlocution, which are often impracticable in the case of foreign companies.

We cannot, in justice to our readers, dismiss the subject of insurance without calling particular attention to the fact, so often overlooked by many, that the lowest priced policy is not the best bargain, but that, on the contrary, it is, as a rule, the poorest. If a farmer buys a plow or a mill-owner an engine at half what it costs to manufacture it, his purchase is at once delivered to him, and he gets a bargain; but if he buys a promissory note at fifty cents on the dollar, or a "half price" insurance policy, the coin which is represented by the paper is not delivered to him at the time and the chances are that he is "gambling" in a game at which he will be the loser. As insurance companies derive their coin wherewith to pay losses from the sale of their promises to pay (the policies) it is evident that if they sell them for half what experience has shown to be necessary in order to pay losses and expenses, the purchaser of the policy will be doomed to disappointment when a fire occurs. "The best is the cheapest" in insurance as well as in other matters, generally speaking.

THE INSURANCE CENTER OF SAN FRANCISCO.

PRESIDENT ARTHUR has designated Prof. George Davidson of the United States Coast and Geodetic Survey (now temporarily in Washington), as "one of the Commissioners to examine and test the fineness and weight of the coins reserved and forwarded for this purpose by the several mints of the United States during the year 1884." The Commissioners will meet at the Mint at Philadelphia on the 11th of February and the examination and tests usually require three days' work, for which there is no compensation.

A GOLD BEARING LEAD.—According to report what promises to be a very valuable gold mine has been discovered in Winnemucca mountain. The discoverers have kept the matter quiet until they ascertained by development whether they had a ledge or not, but we learn from a reliable source that they have uncovered a lead over five feet wide carrying ore that assays about $40 per ton in gold.—*Silver State.*

WE received at this port in January 89,677 tons of coal as against 72,059 tons in the same month of 1884. The Wellington was on fire during a portion of the month. The steam collier *San Pedro*, made two trips to the Carbon Hill mine last month, the first in three months.

THE State Miners' Union has issued an address for a reduction of 10 per cent all over Ohio in coal mining. This practically ends the Hocking Valley strike, as it brings the rate to 60 cents in that district.

THE stockholders of the Queen of the Hills mine, Wood river, Idaho, have been paid $12,500, a ten per cent dividend.

The Appropriation of Water.

The Legislative Committee of the State Irrigation Convention have given their views on the questions entrusted to them in the shape of bills which have been duly introduced at Sacramento. There are five of them. One repeals Section 1,422 of the Civil Code. This is the section which seems to recognize riparian rights. Another amends Section 4,488 of the Political Code, making it read as follows:

"The Common law of England, so far as it is consistent with and adopted to the natural and physical conditions of the State, and the necessities of the people thereof, and not repugnant to, or inconsistent with the Constitution of the United States, or the Constitution or laws, or established customs of the people of this State, is the rule of decision in all the Courts of this State."

Another bill is concerning the appropriation of water and is as follows:

SECTION 1. Every person, company, association or incorporation, appropriating, diverting or claiming the right to divest, for agricultural purposes or other beneficial uses, the waters of the lakes, rivers, streams or other natural sources of supply within the State, shall, within one year after the passage of this Act, file in the office of the County Recorder of the county embracing the point of diversion, a written declaration in duplicate, stating:

(1.) The source from which the water has been actually diverted, and, if diverted undsr a claim of right, the origin, nature and character of such claim.

(2.) The place where and the time when the first diversion was in fact made; and its extent thenceforth to and including the time of the filing of said declaration.

(3.) The kind and dimensions of the works by which the diversion has been and is effected.

(4.) The place or places, where and the specific use or uses to and for which the water has been and is applied or employed, and is and the area and description of lands, if any, irrigated thereby.

And in the case of a claim or right to divert, but without previous actual diversion, the said declaration shall state:

(a) The origin, character and date of such claims;

(h) The source of supply to which it is claimed the right attaches;

(c) The quantity of water claimed and the point of intended diversion;

(d) The purpose for which tbe water is claimed and the place of intended use;

(e) The means by which it is intended to divert the water, and the size and grads of the ditch, canal, flume, pipe, aqueduct or other works by which it is to bs diverted.

(f) The works, if any made or constructed, in and by whicb it is intended to divert the water, the extent thereof, and when their construction commenced and ceased.

In each of the cases above named, the said declaration, in so far as the description of works and measurements of water are concerned, shall be made substantially in the form and according to the explanations to be furnished by the State Engineer, and said declaration shall be signed hy the appropriator or claimant, or, where a corporation is the declarer, by some person thereto duly authorized, and shall be verified by the oath of a party thereto, to the effect that said declaration is true to the best of his knowledge and belief.

SEC. 2. The State Engineer shall make out and cause to be printed, blank forms of statement for the foregoing declaration of facts as to dimensions and description of works and volumes of water, together with explanations such as will conduce to uniformity of result in their use, and shall furnish the same in sufficient quan'ities to the several offices of County Recorders. The County Recorders shall furnish all applicants, who propose complying with the provisions of this Act, with such number of these forms and sxplanations as will serve their purpose. The County Recorder shall receive and receipt for the declarations mentioned in Section 1; shall file one copy of each in his vaults and shall forward the duplicate thereof, by the safest ordinary conveyance for similar matter to the office of the State Engineer, at the State Capitol.

SEC. 3. Upon failure of any claimant of a right to divert water from natural sources of supply, to make and file the declaration of claim as prescribed in Section 1 of this Act, such claim and every right therein and thereby set up or asserted, shall, by force and effect of failure itself and alone, cease and thereby be conclusively deemed waived and abandoned.

SEC. 4. As soon as practicable after the expiration of the one year in which the declarations of claim are to be made, as provided in Section 1 of this Act, the State Engineer shall certify to the Attorney General a complete list of the instances of diversion of water grouped according to the several sources of supply to which they are applied, according to the information iu bis office or in the offices of the County Recorders.

SEC. 5. As soon as practicable after the receipt of the certified lists of diversions provided for in Section 4, the Attorney General shall cause to be brought, in the name of "The People of the State of California," and to be prosecuted to judgment, with all practical speed, in the Superior Court of any county through, by or in which such stream flows or source exists, and wherein any appropriations, diversions or claims of right are located, an action against all the claimants to the waters of said stream jointly, naming them so far as known, and against all unknown claimants thereof. The complaint, after stating the title of the action, the name of the Court and county, and the names of the parties, so far as these can be conveniently ascertained, shall set forth that the defendants divert, or claim the right to divert, the waters of the certain source, to the extent and by the means of works either actual or proposed, as, in the State Engineer's said statement, are particularly designatcd, located and described, specifying such particulars from and according to said statement. The complaint shall then further aver, upon information and belief, that the said diverted water, in each instance, is diverted without right or authority in law; and pray that the defendants answer and fully disclose and

First.—Whether their said several appropriations, diversions or claims of future right to divert and appropriate are made, under claim of right.

Second.—If made under a claim of right in each case, the origin thereof, and when and how the asserted right accrued.

Third—When, in each case, the first diversion was made, its then extent, and the extent of the diversion thenceforth and to the time of the said action brought.

Fourth—When, where and how and to what extent the waters diverted, in each case, have been utilized each season of diversion.

Fifth—The size and character of the works for diverting the water and for conducting it to the place or places of use.

Sixth—Ths extent of the claim of right to future diversion, and the size and character of the proposed works.

And the complaint shall further pray that all the said several matters of fact, as to which discovery is sought, be settled and adjudicated by the findings of the Court, and judgment bs entered accordingly; and that in default of appearance and answer by either defendant, his claim of right be adjudged waived and abandoned.

SEC. 6. The summons must be directed to all parties to the action named in the complaint, and generally to all other persons claiming to have any right to appropriate, divert and utilize the waters of said stream or source of supply, or any part or portion thereof; and in addition to the then existing sta utory requirements in that behalf, shall direct all persons interested in the appropriation, diversion and utilization of the waters of said stream or source of supply, to appear in said action in the Court wherein said action is pending, and set forth the character, nature and extent of their interest or claim of interest therein, and notify them that if they fail to appear and answer the complaint and to set forth their respective claims, judgment will be entered against them and each of them that they have not, nor has either of them, any right to divert and utilizs said waters, or any part or portion thereof.

SEC. 7. After the filing of said complaint, the Court in which said action is pending, without any affidavit in that behalf, shall order the said summons to be published at least once a week for two months, in some one or more newspapers designated by the Court, one of which shall be printed in the county in which said action is brought, if there be one printed in county; and if the strsam runs through two or more counties the Court may, in its discretion, order the said summons to be also published in a newspaper printed in any other county than that in which said action is brought, through or into which said stream flows. And the said Court shall, at the same time, order said summons to be posted on said stream or source of supply, at all points of actual diversion, appropriation or use of the waters thereof. The posting may be made by any citizen or citizens of the State, over twenty-one years of age. Said summons shall be served personally upon all the defendants named in the summons, who can with reasonable diligence be found in the State. All parties interested shall have the same time to answer the complaint, after service of summons, as is provided in Section four hundred and seven of the Code of Civil Procedure. The service of publication shall be complete at the expiration of the actual publica'ion thereof in the newspaper or newspapers as heretofore provided, and the service hy posting shall be complete at the end of sixty days from the posting thereof.

SEC. 8. After service of snmmons has been completed, as heretofore provided, the Court shall examine into the nature and character of the service thereof and ascertain whether it has been in all respects as herein provided. If the Court finds that in any particular the service is incomplete, it shall order the service in that respect only to be remade, and when finally completed in accordance with the provisions hereof, to the satisfaction of tbe Court, the Court shall enter its decree that due and legal service of said summons has been made upon all persons whomsoever interested in any way whatever in the division and utilization of the waters of said stream or source of supply, and said decree shall, in that respect, be conclusive upon all persons whomsoever, and thereafter said Court shall be conclusively deemed to have, and shall have, complete jurisdiction of the subject matter of said action, viz.: all the waters of said stream or force of supply, and of all persons whomsoever having any right to divert, utilize or appropriate the same or any part or portion thereof, and to that end the action is, and is hereby declared to be a proceeding in rsm.

SEC. 9. If, during the pendency of the action, any of the parties die or become insane, or incompetent, the proceedings shall not for that reason, or any other reason, be delayed or suspended, or in any manner affected.

SEC. 10. The Court having jurisdiction in said cause, as hereinbefore provided, shall proceed to adjudicate and detsrmine the rights of all persons interested, and to that end shall have power to refer the sams to a referee to take testimony as to the rights of the respective parties, and report the same to the Court, and generally the said Court shall have, in that behalf, all the powers both of Courts of law and equity, and the proceedings shall be according to the rules laid down in the Code of Civil Procedure of this State, except where herein otherwise provided.

SEC. 11. The Court shall, in its decree, determine, adjudicate and establish the origin, extent, nature and validity of all diversions, appropriations and utilizations of water for agricultural purposes and other beneficial uses made upon the stream or source which is the subject of the particular action before it, the date and extent of such appropriation, the relative rights of each appropriator, diverter, nssr and claimant, with reference to others as to priority and extent of, and limitation upon the rights of each in the waters of the stream.

SEC. 12. Any party interested shall have the same right to motion for a new trial and appeal as is provided by the law for other cases.

SEC. 13. Said decree shall be conclusive on all persons whomsoever, and no such decree shall be invalid by reason of the death of an person interested pending the action, or before decree, but such decree shall be as conclusive against the heirs, legal rspresentatives or assigns of such decedent as if it had been entered before his death.

SEC. 14. If any one or more of the parties defendant in any one of said actions shall object in writing to the trial thereof by the Judge of the Court in which it is pending, the said Judge shall thereby become and be disqualified to try the same, aud thereupon the Governor, at the reqnest of the Attorney-General or any party or on his own motion, shall designate some other Superior Judge to hold said Court, whenever, and at such times as may be necessary to try said action, and to determine all matters therein, and such Judge shall be allowed his actual expenses in going to and returning from and attend upon the said Court in that behalf, which shall be a charge upon the treasury of the county whers such Court is held, and paid out of the general fund thereof.

SEC. 15. It shall be tbe duty of every person, company, association or corporation, who or which has made a declaration in accordance with the requirements of Section 1 of this Act, to annually hereafter file in the said County Recorder's office a statement in duplicate, showing:

(1) The extent of the actual diversion of water, and what increase, if any, has been made therein since the filing of the original declaration.

(2) The extent and dimensions of the works by which the diversion has been and is affected, and what additious and enlargements have besn made therein since the filing of the original declaration.

(3) The place or places where, and the use or uses to and for which the water has been and is applied or employed, and the area and description of lands, if any, irrigated thereby, and what is the extent of the additional use of said water, if any, since filing the original declaration.

SEC. 16. It shall be the duty of every person, company, association and corporation who or which desires hereafter to appropriate, divert or use, or to acquire the right to appropriate, divert or use the waters of the lakes, rivers, streams or other natural sources of supply within this State, under the laws thercof, within 60 days after the commencement of their claim, to file in the office of said County Recorder, a declaration in form, as provided in the latter part of Section 1 of this Act, for claimants of a right to divert without previous diversion, and thereafter all claimants shall make the annual statement provided for in Section 15 hereof.

SEC. 17. Words used in this Act in the present tense include the future as well as the present; words used in the masculine gender include the feminine and neuter; the singular number includes the plural, and the plural the singular; the word person includes a corporation as well as a natural person.

SEC. 18. This Act shall take effect immediately after its passage.

PROTECTION OF MINERS.—When Samuel T. Oates was a member of the Legislature from this county years ago, he introduced a hill compelling mine owners to provide two places of egress from underground mines, so that in case of accident the miners would have better means of escape. The bill, we believe, passed both houses and became a law. Senator Reddy has introduced into the present Legislature a bill that is similar in some respects to the one presented hy Oates. "The bill makes it unlawful for any mining corporatiou to sink the shaf s below 300 feet without a second mode of egress from such mine hy shaft or tunnel, to connect with the main shaft at a depth of not less than 100 feet from the surface. When the company fails to provide the mode of egress, and any accident occurs to any minsr, the owners are made liable for all damages which may be caused by the accident. It is also made unlawful for any company where there is no second mode of egress, and where steam hoisting works are used, to leave the hoisting works iu chargs of but one person."

Locating Mining Claims.

The following circular has been ssnt out from the General Land office at Washington to United States Surveyors General and Registers and Receivers:

1. The rights granted to locators under Section 2322, Revised Statutes, are restricted to such locations on veins, lodss or ledges as may be "situated on the *public domain*." In applications for lode claims where the survey conflicts with a prior valid lode claim or entry, and the ground in conflict is excluded, the applicant not only has no right to the excluded ground, but he has no right to that portion of any vein or lode the top or apex of which lies within such sxcluded grouud, unless his location was prior to May 10, 1872. His right to the lode claimed terminates where the lode, in its onward course or strike, intersects the exterior boundary of such excluded ground and passes within it.

2. The end line of this survey should not, therefore, he established beyond such intersection, unless it should be necessary so to do for the purpose of including ground held and claimed under a location which was made upon public land and valid at the tims it was made. To include such ground (which may possibly embrace other lodes) the end-line of the survey may be established within the conflicting survey, but the line must be so run as not to extend any further into the conflicting survey than may be necessary to make such end-line parallel to the other end-line, and at the same time embracs the grounds so hsld and claimed. The useless practice in such cases of extending *both* the side-lines of a survey into a conflicting survey and estahlishing an end-line wholly within it, beyond a point necessary under the rule just stated, will be discontinued.

3. After the receipt of this circular at the local land office all applications for mineral patents, applications to purchase, Register's final certificates of entry and Receiver's receipts must not only describe the ground claimed but must state specifically what conflict or conflicts with other survsys, lots or claims are excluded, giving the number of each conflicting survey or lot. The published and posted notices must contain the same information.

The Mint Director's Report.

The Director of the Mint is engaged in the preparation of his report on the production of gold and silver in the United Statss during ths calendar year of 1884. From the returns mads from mints and assay offices, it appears, he says, that, contrary to his own expectation and general opinion, a greater amount of gold was obtained from the mines of the United States in 1884 than during the previous year. Reports from mints aud assay offices of the deposits of gold and silver which he caused to be verified hy the accounts, show that during ths calendar year of 1884 they received gold of domestic production to the amount of $30,807,169, nearly $800,000 more than tbe previous year, while the deposits of foreign gold bullion were $11,217,309; foreign coin, $9,328,922; jewelry, plate, etc., $1,899,577, and United States gold coin $265,171. The total, excluding redeposits, $50,518,148. Burchard says there can be question but that nearly $31,000,000 in gold, as shown by the reports, were obtained from mines in ths United States during the last calendar year, because the description and character of the gold is apparent to the weight clerks upon inspection, or is easily ascertained, and generally the locality, also from whence received, by inquiry, or knowledge of the husiness depositor, and is entered on record. Secondly, every ounce of $50,000,000 of gold reported to have been received during the ycar is entered in the accounts, and has been or must he paid for by the officers in charge of the institutions where it has been received. Thirdly, the deposits of foreign gold bullion exceeded its net imports $2,475,797, and although deposits were less hy uearly $3,000,000 than the imports of foreign gold coin, it was because that of the imports of the lat'er last November and December at ths port of New York, amounting to nearly $5,000,000, only $681,612 had, up to the first of January, been sent to the New York assay-office, the remainder probahly being held in New York, perhaps awaiting the export demaud. It is improbable that foreign bullion could be entered at the New York assay office as domestic gold. The director says that no deduction should be made on that account from the $30,800,000 of the reported deposits of domestic gold bullion.

THE Union Pacific system consists of 4,748 miles of road under the full management of the company, and enough more in which the company has a controlling interest to bring the entire system up to 5,670 miles, making it the most extensive railway system in the hands of one company in America.

Montana Smelter.

The *Butte* (Montana) *Miner* says: It has been rumored upon the streets for a few days past, that several, if not all the copper smelters, in the vicinity of Butte and the Anaconda smelter would shut down in the near future. Inquiry develops the fact, that there is more foundation for the rumor than is agreeable to contemplate. The cause assigned for the shutting down of the work, is the unprecedented low price to which copper has fallen. The metal is now quoted at 9½ cents in New York, with no visible prospects of an immediate advance. Smelting men say it costs 9 cents a pound to lay down copper in that market, and that to continue the smelting of ore at that price is like working for a new dollar in the place of an old one, and that they do not care to exhaust their mines without some remuneration for the wear and tear of their plants. We understand that the mines will be worked as usual, and probably with the usual complement of men, the smelters alone being closed down.

While it is not pleasant to contemplate this condition of things, it is well that all should realize its possibility and prepare to face this reality. Forewarned is forearmed, in this contingency, as well as in others. The shutting down of the smelters, would throw hundreds of men out of employment, and work a great hardship to many who are not prepared to pass through the bleakest season of the year in idleness. The question then arises, what shall be done? or what can be done under the circumstances? An advance in the price of copper would settle the problem, but as we have said, there is no present prospect of such advance. This being the case, there must be a cutting down of expenses somewhere, that copper miners may realize a fair profit upon their investment. Where should that cutting down be done? Let us see. The Utah and Northern railway on an average, ship daily from this place twenty-five carloads of ore and matte to Omaha. Each car takes ten tons, and the twenty-five cars 250 tons. The freight on this ore and matte, we understand, is $20 per ton or $5,000 per day. We furthermore understand that the actual cost to the railway company of this transportion to the point named, does not exceed $3.11 per ton, thus leaving a clear earning of $16.89 per ton or $4,252.50 per day. Of course, a certain amount must be deducted from the latter sum of wear and tear of road and rolling stock and interest on money invested, etc.

In considering what the railway company can do in the matter of reducing freights and thus aiding copper miners, another important point must be noted. Butte business men, smelting men and miners, pay on an average about $7,000 a day or $215,000 a month, charges on incoming freight, making an aggregate of $12,000 a day or $360,000 a month paid for freight by Butte business and mining men alone. In view of these facts and figures, it would seem that the railway company should not step forward and help the smelting men out by a pronounced reduction of freight charges each way. Their interests, it would appear, lay in the direct line of this step. One thing, however, is certain. If a reduction is not made in the expense attending the laying down of Butte copper in the New York market, the Utah and Northern may as well prepare to side track a large number of freight cars.

WORKING TAILINGS.—The Pioche (Nevada) *Record* says that the Bullionville Smelting Company has purchased the Dry Valley tailings, and that Mr. Godbe is expected there to rebuild the track of the railway which was torn up last fall by Bishop Taylor, of Iron county, Utah, so that he can transport the tailings cheaply to the reduction works at Bullionville. After seeing this notice, a reporter of the *Tribune* met Mr. W. S. Godbe, who said it is true they have bought the tailings. He estimates the tailings at 25,000 tons, assaying about $15 per ton in gold and silver. The railroad from Bullionville to Pioche was bought to remove into Iron county to aid in opening up the iron mines there. The rails and ties are piled up along the track, and if the material can be rented on favorable terms the road will be put down between Bullionville and Panacca, at which latter place the tailings are, and used for transporting the tailings. If not, they will be worked where they are without roasting, and this will cause the loss of many thousands of dollars which would be saved by roasting. It would benefit the owners of the road materially and the people in that locality to have the road running. Mr. Godbe expects to visit that locality soon, and make some kind of arrangements for the coming season's operations. The tailings are to be treated by the use of sulphur. The Bullionville works get their sulphur from Decker's sulphur works.

DANGER FROM PAMPAS GRASS.—A Philadelphia lady recently received a large package of that showy and feathery grass as a Christmas present. The plumes were laid upon a table under a hanging lamp. In handling them, the dust or down which always arises from them, when handled suddenly took fire; and burnt with an explosive energy similar to the explosive burning of dust, which often occurs with disastrous effect in flour mills. As pampas grass is quite a popular ornament, it is well to know that such accidents are possible when these plumes are brought near a flame.

USEFUL INFORMATION.

DARNING WITH HUMAN HAIR.—A Baltimore merchant tailor says he frequently does fine darning with strands of hair from his wife's head. It often happens that there is a small clean-cut place in a bolt of goods. It may not be known until after a garment has been cut out. But when it is discovered the tailor cannot afford to throw the piece. He simply calls on his wife for several strands of hair, hands them to the best-skilled workman in the shop and bids him mend the rent. He uses a very fine needle, and does his work so perfectly that it is never known that the cloth was cut. He said to a reporter: "I once knew a tailor who got in a peck of trouble from having cut the button-holes on the wrong side of a costly coat. He finally overcame the difficulty by mending them with his wife's hair. Once upon a time, as the story book says, I cut out and had made a fine cloth coat, which was discovered, before being sent home, to have a defect in it which could not be remedied without stitching it with a piece of cloth the size of a ten cent silver piece away. After puzzling over it for half a day, I secured a sharp tubular steel instrument, such as one would think might be used in cutting gun wads. With this I cut out the defect in the cloth, fitted a piece in the hole taken from a scrap of the same material and sewed it with hair. Of course I was careful to have the nap run right. It was so perfectly done that no one ever discovered it."

PRESERVING EGGS.—At the Birmingham Poultry Show, England, prizes were offered for the best dozen preserved eggs that had been kept two months. The eggs were tested by breaking one of each set competing for the prize into a clean saucer; also by boiling one of each lot. The eggs that had been preserved in lime water, it was found on breaking them, presented cloudy whites. Eggs preserved by rubbing over with beeswax and oil showed thin, watery whites. Eggs that stood best the test of boiling, and which gained the first prize, had been simply packed in common salt. These had lost little, if any, by evaporation, had good, consistent albumen, and were pleasant to the taste. The exhibit which took the second prize was scarcely inferior in quality. They were preserved as follows: Melt one part of white wax to two parts of spermaceti, boil and mix thoroughly; or two parts clarified suet to one of wax and one of spermaceti. Take new-laid eggs, rub with antiseptic salt or fine rice starch. Wrap each egg in fine tissue paper, putting the broad edge downward; screw the paper tightly at the top, leaving an inch to hold it by. Dip each egg rapidly in the fat heated to 100°. Withdraw and leave to cool. Pack broad end downward in dry sand or sawdust. The judges were inclined to believe that had the trial been for a longer period than two months this latter method would perhaps have proven the better of the two. The eggs were excellent, and on stripping off the waxed paper the shells presented the clean, fresh appearance of newly-laid eggs.

AN IMPROVED BANK NOTE PAPER.—A new kind of paper for bank notes, bonds, etc., has been devised, which can neither be counterfeited or so far destroyed by fire as to become unrecognizable. To prevent destruction by fire a sufficient quantity of asbestos is worked into the pulp to prevent the bills from being reduced to ashes or lose the identity of their value. A sufficient quantity of linen or its equivalent is introduced into the pulp to render it sufficiently pliable and strong. The paper is further made with the denomination of the note or other security designated by means of silk fiber of different colors introduced within the body of the paper in the course of manufacture. For example, green fiber is taken to indicate $1, orange to indicate $2, blue to indicate $5, and scarlet to indicate $10. For $20 any two of these may be combined, and for $50 and $100, and documents above that value, three of the colors, according to any prearranged system. The fiber is also used for indicating the owner or origin of the bank note or other instrument by initials, names, or any other mark, private or otherwise, or any suitable device or form in which the colored fiber may be arranged.

CHANGING THE OYSTER'S FLAVOR.—An oyster expert thus discourses: You can change the flavor of an oyster just as you can a pot of soup. You know that in soups the stock or consomme is only made, and from that nearly all the other kinds are obtained by the addition of the chicken or vegetables, or whatever is used. Take an oyster and change it from salt water to fresh, or partly fresh, and it makes a difference in its flavor. The Northern oyster cultivators are studying this feature of the business, with a consequent improvement in the flavor and quality of the oysters. When the oysterman brings oysters in from the deep water and throws them over into fresh water, it is what they call "giving them a drink."

IS ARTIFICIAL STONE A NEW PRODUCT?—It is believed by many persons that the art of making artificial stones is prehistoric, and that the Pyramids were built of artificial blocks manufactured from the sands of the surrounding plain. In modern times a Frenchman named Coignet has accomplished some wonderful work with artificial stone. The most important and costly work that has yet been undertaken with Coignet's material is a section three miles in length of the Vanne aqueduct for supplying water to the city of Paris. Another interesting application of this material has been made in the construction of the lighthouse at Port Said, Egypt. It is 180 feet high, and resting upon a monolithic block of beton, containing nearly 400 cubic yards.

WHAT IS GLUCOSE?—Glucose is essentially the same as grape sugar, and glucose syrup is nearly identical with pure strained honey. It consists of 24 parts of carbon to 28 each of hydrogen and oxygen, whereas cane sugar contains the same amount of carbon and to only 22 parts each of hydrogen and oxygen. It is manufactured from the starch in corn and other grains by the action of dilute acids and alkalies, by a process too technical to be described here. Glucose is not unwholesome, but does not possess the same degree of sweetness as cane sugar.

THE AMERICAN WALNUT.—A writer in the *Gardener's Monthly* states that, when properly cured, the kernel of the American walnut is white and delicious, with a delicate flavor hardly surpassed by any nut. The nuts should be gathered as soon as they are ripe, and not allowed to remain in the hull. They should then be dried quickly.

SHAKE YOUR CARPETS OFTEN.—The oftener carpets are shaken, the longer they wear. The dirt that collects under them grinds out the treads. Do not sweep carpets oftener than is necessary. A broom wears them very much, When a carpet is faded, strong salt and water will often restore the brightness of the color.

THE MELLOWNESS OF OLD WINE, it has been found, is due to an increase in the proportion of glycerins contained in it more than to a decrease in the proportion of tannin which it holds. The orthodox *Churchman* says returning missionaries declare that unfermented wine was never known in Syria.

GOOD HEALTH.

How the Senses May be Deceived.

Immerse the forefinger of one hand in water at 104 degrees Fahrenheit, and then plunge the whole of the other hand into water with a temperature of 102 degrees Fahrenheit. The latter, although two degrees cooler will be judged to be the warmer of the two, from which it appears that the intensity of the sensation of temperature depends, not only more upon the relative degree of heat to which the parts are exposed, but also upon the extent of surface over which it is applied. From this cause a bath which is not uncomfortably warm when a few fingers are dipped into it, appears scalding hot when the whole body is immersed. The sense of temperature is, likewise, entirely at fault when required to determine which is the warmer of two substances, say a piece of iron and a piece of wood, for if they both have the same temperature, the iron will feel the hotter of the two, because of its being a so much better conductor. A slight difference of temperature, however, between two substances of like nature is easily discerned, and we may here describe a simple but highly entertaining trick which is founded on this fact.

The performer having placed his hat behind him, requests the people present to place in it three or four pennies. He shakes it up behind him, and then asks some person to take out a penny and closely examine it. He has then to pass it to the others for examination, the last one pitching it back into the hat again. The pennies are then re-shaken up, and the performer now, placing one hand behind him, picks out the penny which has been examined, although throughout the whole operation he has never seen it. When the experiment has been done some two or three times successfully all sorts of unlikely suggestions are made as to the way in which this feat has been performed, but very seldom the right one, which is exceedingly simple. The people in handling the penny which was selected from the others make it warm. It is, therefore, easy to pick it out from the others when it has been pitched into the hat again. This sufficiently demonstrates the fact that at ordinary temperature the sense of temperature as localized in the fingers is sufficiently sensitive to discriminate between several pieces of metal so as to say which is the warmest.

But for the extremes of hot and cold, touch is thoroughly deceived, a piece of frozen mercury giving a burning sensation like a red hot bar of metal. The touch which attains to such perfection in persons afflicted with blindness is readily deceived. This is shown forcibly by the experiment of Aristotle. Cross the index and middle fingers and run them over a marble placed on a table, with the eyes shut. Under such circumstances one has difficulty in avoiding the belief that he is dealing with two marbles instead of one. The idea of roundness which has been ordained by a complex judgment founded on the coalescence of several sensations, is here applealed to, but the usual conditions being reversed, we draw a wrong conclusion. The sense of taste may be likewise confounded by altering the conditions under which the gustatory operation is always carried on. Thus, if the nostrils be held firmly, it is impossible to distinguish between applying an onion or an apple to the tongue.

How Do You Lie?

Dr. Delaunay, an eminent French student, writes to the Paris Biological Society on the subject of dreams. He claims that the character of our dreams is very much determined by the position we occupy in sleep. The most general method of lying, perhaps, is on the right side, and this appears to be also the most natural method, for many persons object to lying upon the side of the heart, which, it has been more than once asserted, should have action during sleep. Nevertheless, Dr. Delaunay's statements hardly harmonize with this opinion. When one sleeps upon the right side, that is to say, upon the right side of the brain, one's dreams have marked and other unpleasant characteristics. These characteristics, however, are essentially those which enter into the popular definition of dreams. One's dreams are then apt to be illogical, absurd, childish, uncertain, incoherent, full of vivacity and exaggeration. Dreams which come from sleeping on the right side are, in short, simply deceptions. They bring to the mind very old or faint remembrances, and they are often accompanied by nightmares. Dr. Delaunay points out that sleepers frequently compose verse or rhythmical language while they are lying on their right side. This verse, though at times correct enough, is absolutely without sense. The moral faculties are then at work, but the intellectual faculties are absent. On the other hand, when a person slumbers on his left side, his dreams are not only less absurd, but they may also be intelligent. They are, as a rule, concerned with recent things, not with reminiscences.

SLEEPLESSNESS—In order to avoid sleeplessness, keep yourself free, as far as possible, from that fatal enemy of sleep, indigestion, by the strict adherence to those laws of diet which in these days of running after knowledge must be familiar to all of you. Take care that you abstain from those unhealthy and sleep-depriving heavy suppers; though there can be no harm in having a light meal of some plainly cooked nutritious food some little time before bed-time; in fact, in many cases of wakefulness in debilitated or even weakly persons, such a meal rather predisposes to sleep. Whatever is taken at the time should be easy of digestion and not likely in any way to irritate the stomach, and should be taken in a moderate quantity. Exercise, and exercise in the open air, is actually necessary for the preservation of healthy sleep, and among the women of our poorer classes, more especially those living in our towns, this is not thought of as it should be. If care and worry prevent sleep, I should advise some gentle occupation of the mind prior to retiring to rest—a game of chess, cards or backgammon, an hour's social conversation, or even a little reading when actually in bed, provided that it is nothing very exciting. A warm bath, again, is an excellent excitant of sleep, but must not be indulged in too often.

A NOVEL AND DELICATE SURGICAL OPERATION.—Dr. Axteile, of this city, is attending an important surgical case in Waterbury. Some six weeks ago, Michael Shea, while employed at the factory of the Scovill Manufacturing Company, had his hand caught in the straightening rolls. The member was frightfully mutilated, and amputation was at first thought necessary. With a forlorn hope the hand was kept, however, but it has obstinately refused to heal, the skin and flesh peeling off badly. Now the surgeons have decided to make an incision into the man's breast, form a pocket there and thrust his hand into it. There it will be kept for a week, when the flesh of the breast will have grown on to the hand, and then the hand will be cut away. The fingers, of course, cannot be fully restored, but the bare joints will be covered, and the whole hand practically restored to the man, who depends upon it for his daily food.—*Hartford, Conn., Post.*

DISINFECTING THE LUNGS.—Now that it is generally conceded that consumption is caused by germs which multiply in the lungs, a method of disinfecting them, which shall be harmless, has been sought for, but as yet without avail. The vapor of creosote, the oil of the eucalyptus, and carbolic acid have been tried, and, to some extent, they may paralyze or stun the germs and prevent their rapid increase; but as the passages of the lungs are delicate, and the vapor cannot be brought very near to them without injury, the good effects are slight. But there is one method which cannot fail to prove beneficial, and that is the inhalation of large quantities of fresh, pure air—the more of it the better.

THE TEETH OF MAMMALS.—In the majority of mammals the teeth are limited in number and definite in their forms. The number ranges from one in the narwhal to 220 in the dolphin. The average is 32, occurring in ruminants, apes, and man, but 44, as in the hog and mole, is called the typical or normal number, and this number is exceeded only in the lower groups.

INFLUENCE OF ARTIFICIAL FOODS ON COWS' MILK.—After experiments in 1883 and 1884, Messrs. A. Andouard and V. Dezaunay have concluded that pulps and other artificially prepared foods act injuriously on the milk of cows, but increase the quantity of butter without affecting its quality.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

SOUTH SPRING HILL.—Amador *Ledger*, Jan. 31: On Monday last we made a personal inspection of the improvements which have been recently made at this promising mine. First in importance is a new engine for hoisting purposes, purchased at the National Iron Works of San Francisco, at a cost of $5,000. It is supplied with solid cast-iron frame, and is in every respect a first-class piece of machinery. It is already in position, erected at an elevation of 10 ft above the platform upon which the old works stand. These works are said to be sufficiently powerful to meet all the requirements of the mine until a depth of 1000 or 1200 ft is attained. Everything is in position to start the new works, with a large quantity of flat wire cable on hand. The change will be inaugurated next Monday. The old works are now being run to their utmost capacity to get out a quantity of ore ahead so as to keep the mill running while the change is being made, which will take probably a week to complete. Connected with the boiler is a steam pump to supply water, also an injector, which utilizes the escaped steam, and thereby effects a great saving in fuel. A substantial building has been erected over the works, 100 ft long by about 40 ft wide, in which carpenter's shop, superintendent's office and changing room are conveniently located. Detached from this is a blacksmith snop. The new track from the mine to the mill is another noticeable improvement. It is 2000 ft in length, furnished with steel railroad iron, 16 pounds to the yard; 500 ft is laid on trestlework. A commodious ore bin, capable of holding 300 tons of rock, receives the ore from the mine. Immediately above the car-track the dump is supplied with a pair of chutes, operated by patent gates. The car is run under one of these, the gate is easily opened by one man, when the ore falls into the car by its own gravity, filling it in less time than it takes to describe it. The track is slightly up-grade to the mill, but one horse is able to haul the load without difficulty. The value of this track will be appreciated when we state that formerly it cost $250 to $300 per month to haul the ore by teams to the mill; now the cost does not exceed $30 or $40 per month. Underground the mine is looking as well as ever. The ore-body holds its own both in dimensions and quality. All the rock extracted so far has come from the 600-ft level —the only level at present in the mine. There is an air of thrift and good order about the works, which speaks well for the management. The company talk of adding ro more stamps to the mill the coming spring.

BUNKER HILL.—We are glad to be able to report this mine in a prosperous condition. The 40-stamp mill is kept running to its full capacity. A contract has been let to sink the shaft 100 ft deeper. Manual Costa was awarded the contract at $7 per foot, and commenced upon the job last week. Another contract has been let for making roo ft upraise, from the 600 to the 500-ft level. W. Perkins secured this contract, at $2.50 per foot, so we are informed. The work was commenced last Monday.

MISCELLANEOUS.—At the Medlan, the workmen are drifting on the ledge at a depth of 130 ft, encountering lots of rock, but whether of paying grade or not remains to be determined. The prospecting operations at the Keystone consist in running a tunnel west at a vertical depth of rooo ft from the surface. They are still a considerable distance from the point where the ledge matter is supposed to be. The face is in hard green-stone, and progress is necessarily slow. It will probably be some months yet before the ledge is reached. W. E. Stewart has got 80 tons of ore on the dump at the Lighthouse mine, near Butte City, and will commence crushing soon. Messrs. Nevills and Nichols have bonded the Moore mine, one mile south of Jackson, from Messrs. Bright and Newman for the sum of $15,000. According to the terms of the bond, $1,500 is to be paid on or before the 1st of April, the balance in one year's time. The bonders are not to have possession until the $1,500 is paid. Mr. Nevills left for the city early this week, and is expected back to-day or to-morrow. The Huntington roller quartz mill, at the Amador Queen mine in Hunt's gulch, was started Tuesday morning. It is supplied with Triumph concentrators. As both the mill and concentrators are new to this county we shall take an early opportunity of seeing them in actual working, and reporting thereon. Mr. Shugert informs us that the mill crushes 20 tons per day.

ENCOURAGING.—Amador *Sentinel*, Jan. 28: Wm. E. Stewart has been working the "Lightbouse mine" near the Mokelumne river, of late, and is meeting with most encouraging prospects. A tunnel is now run on the mine 63 feet, a lead of four feet wide showing in the face of the same. The slope which is now being worked is 60 feet long, and it is estimated that the entire body of ore in sight will pay $5 per ton, and it can be worked at an expense less than $2 per ton. A crushing of 150 tons of picked ore will shortly be made at the Matson mill.

WETZLAR.—Amador *Dispatch*, Jan. 28: The Wetzlar mine, owned by John Wetzlar and Martin White, still continues to produce rock of wonderful richness, and the proprietors are consequently happy. The Tellurium mine, near Pine Grove was sold at Sheriff's sale last Monday, to Lorenzo Arata, the price paid being $1,808.02.

Inyo.

BEVERIDGE DISTRICT.—Bodie *Free Press*, Jan. 30: In the gorges of the Inyo mountains, on the east side of the summit and just across from Owens Lake, is located Beveridge district. It, so far, has been mainly notable for having the Keynot mine—a property which has produced gold variously estimated at from four to five hundred thousand dollars. True, this amount has not been reported from the ores worked at the Keynot and Freetom canyon mills, but the aggregate sums taken out of the arastras and pounded up from the rich rock will reach close to the latter figure. The past winter down there has been so severe that communication across the Inyos has only been obtained by shoveling trails for ten miles through from five to fifteen feet of snow. Joe McDermott, formerly of Bodie and Benton, is now running the Freetom canyon mill and mines under great difficulties, but with increasing good prospects as the spring opens. A new strike of a big gold ledge in Hunter's canyon, near the steam arastra, is reported by the lucky owners—Messrs. Strauss and Miranda of Lone Pine—who talk strongly of putting up a five-stamp battery. Altogether the indications are good for this particular portion of our neighboring county's domain.

Mono.

NEW STRIKE AT THE SOUTH END.—Bodie *Free Press*, Jan. 30: For several months past Sutter, Barta, Kapff and Hoffman have been engaged in pushing a tunnel into Sugar Loaf mountain south of Queen Bee Hill and below the cottonwood wagon grade. They were stimulated to prosecute the work by the presence of a large quantity of porphyry and mixed occasionally with little stringers of quartz. At a point about 600 fect from the mouth of the tunnel a ledge four feet wide of free milling ore was struck tbe other day. The character of the ore is exactly identical with that of the Noonday and Red Cloud mines, except that it carries little or no base metal. It has a pure white, chalky appearance very much like Comstock rock, and will average about $35 per ton in silver and $4 in gold. Several assays were made showing $80 in silver and over $6 in gold. It has created considerable interest, as the conclusion is drawn respecting tbe South End and the advantage of resurrecting abandoned prospects.

Mariposa.

DILTZ MINE.—Mariposa *Gazette*, Jan. 31: Capt. Diltz came into town on Thursday and gave us an opportunity to interview him respecting his mine and its prospective outgrowth. We have from time to time referred to the hundreds of tons of ore already piled upon the respective dumps for milling purposes which has been taken from the main vein and the numerous strata and undergone the sluicing process of a wash during the rainy season when sufficient water could be obtained, and the great amount of gold realized therefrom. The extensively rich bank mining has induced ditches and reservoirs to be built with a view to ground sluicing principally, which has for many years paid so handsomely, that it has delayed the building of a mill as contemplated in the first instance. Outside of the true fissure vein, which of itself is abundant to justify the outlay of capital to erect mills with the necessary improvements to work the quartz, there abounds rich deposits of gold in the earth and vein matter. To show conclusively the extent of the mine and that it possesses a true fissure vein, five shafts of an average of 200 ft have been sunk at various points, which resulted most satisfactory to the owner. With a view to sinking another shaft the wash of tbe season thus far has been directed to uncovering the vein upon the south side of the hill where lies a large body of earth filled with quartz and other formations carrying gold in a variety of shapes. During the last two week Capt. Diltz has been using the limited amount of water which fell from the last rain to the best advantage. A new section of the vein has been uncovered which shows vein and vein matter, containing gold, some 25 ft wide and increases in width as it goes down. Much of the rock shows gold visible to the naked eye, with the earth and vein matter surrounding appearing richer in gold than ever before, since the Captain has owned the mine. Aside from the regular wash in the sluices, which have not been cleaned up, the Captain has, within the past two weeks, picked up specimens of pure gold, and of rock pounded out in a mortar, bas added to his fund near $3,000, a portion of which we had the pleasure of seeing. With a view to more extended operations in the future, two surveys for pipe lines, about two miles in length each have been made, which will convey ample water from an inexbaustible source for all purposes. This improvement will also open up acres of deep hydraulic mining in the same vicinity. These deep diggings have been known to pay as high as $12 a day to the hand when water could be had.

Nevada.

MACHINERY.—Nevada *Transcript*, Jan. 31: Geo. G. Allan has purchased the machinery from the old works of the Murchie mine and it is being hauled to his foundry. At the Pittsburg mine a small number of men are engaged in doing prospective work. A company consisting of H. G. Battey, B. F. Hartman, A. D. Sutton, M. Norton and A. Damon are running a tunnel in Canada Hill district to re-open the old Pillips ledge which is now known as the Caledonia claim. About 15 years ago the ledge was worked with good results to water level, when it was abandoned although good ore was left in the sbaft. The tunnel now being run will open the claim 90 feet below the old workings.

HORSESHOE MINE.—Grass Valley *Union*, Jan. 31: The shaft on the Horseshoe mine at Wolf creek, is being pumped out for the purpose of resuming regular operations. The heavy rains of December caused a suspension of work, but the company hope to be able to control the water during the remainder of the winter. When work was suspended there was good pay rock in the drift at the 100-foot level.

PENNSYLVANIA MINE.—Grass Valley *Union*, Feb. 3: A cleanup of 77 loads of rock was finished at the Omaha and Rogers' custom mills on Saturday, giving as a result a fraction less than $30 per load, not including sulphurets, which was very satisfactory. This rock was taken from the 175 ft level on both sides of the shaft. The vein on this level shows from 18 to 36 inches in size. The rock contains quite a percentage of high grade sulphurets. The prospects of the mine are considered as excellent, owing to the general good character of the quartz and the size of the vein. The mine is being worked regularly and intelligently under the direction of George Mainhart, who is an experienced and capable miner.

TO BE STARTED UP.—*Transcript*, Feb. 3: The last year the Manzanita hydraulic mine of this city was worked the clean-up was larger by several thousand dollars than during any season since it became the property of Owin Gowell & Co. When Sawyer's injunction was served (since which time no work bas been done) a fine body of gravel was struck which exceeded in richness anything ever seen in the mine. The owners bave been in a quandary to know what to do, but lately they have decided to work it by the drifting process and will commence operations as soon as the weather has become settled. A great many more men will be required to work the mine that way than by the hydraulic process, which will be a good thing for the town. It is believed that drifting will pay well in this instance, and if so, the Manzanita will be be exception to the hydraulic mines in the upper part of the country which have been closed down. A millwright says tbat judging from the number of applications being made for his services, there will during the coming summer be lively times in tbis and Washington mining districts. Three companies have talked with him about building quartz mills during the next six months, and he knows of still other claim owners who propose to make arrangements for crushing their own ore. Some miners have located a very rich quartz ledge near tbe site of the old Florida House, two or three miles north of the Mountain House. Quite a number of men are working in tbat vicinity with good results. It is rumored on the street that one of the big mines in this vicinity will soon be sold by its present owners for a large sum of money. There has been no talk until quite recently of the sale of the property in question.

Sierra.

THE YORK MINE.—Sierra *Tribune*, Jan. 31: One would hardly imagine that times were dull after going up to the York mine and looking around for a while. Everybody tbere is busy, and each man is at his particular occupation. Perfect order and system is noticeable, and nothing is left undone to make every dollar count to the advantage of the company. The new ten-stamp mill is running splendidly on good-looking ore. An upraise is being made on a pay chute 90 ft in from the mouth of the tunnel, and the tunnel is being driven ahead towards chute number two which is about 100 ft beyond the first one, as demonstrated by work further up the mountain side. The ledge is from 2½ to 3 ft thick and large quantities of ore can be extracted at a comparatively small cost. John Berry, of Nevada City, bas charge of the mill. John Skewes, of Grass Valley, is underground foreman and Jerome York is night foreman.

THE INCLINE.—*Mountain-Messenger*, Jan. 31: Tbe Extension incline or "slope" was connected with the tunnel on top, the last of last week, and the appliances for lowering and raising cars will be completed by to-day or to-morrow. It is expected that in a few days everything will be in good working order, and taking out of gravel resumed. The inclined plane is 260 feet long, the rise being one foot in four, making the perpendicular rise 65 feet. The drum is two feet in diameter, and a half inch steel rope will be used. The breaking strain of this cable is 6,000 pounds and a safe working strain is 2,000 pounds, which is just about what it will be called upon to stand, lowering two loaded cars at a time. Mr. Alfred V. Larson informs us that he, in connection with persons from Camptonville, has located an exceedingly rich quartz ledge in the vicinity of the old Florida House, two or three miles north of Dan Cole's. Several persons are now at work upon the ledge.

Trinity.

AS GOOD OR BETTER.—Trinity *Journal*, Jan. 31: Recent developments in the East Fork district, which is less than half-way between Weaverville and New River, show its mines to be fully as good if not better than those of the last named district. New finds are being made frequently, even at this season and the older ledges are showing up splendidly as work advances. Weather permitting we shall visit tbe East Fork mines soon and give the readers of the *Journal* such an account of them as their merits may deserve.

MORE DISCOVERIES.—Frank Moor was in town Tuesday from East Fork and informs us that during the past week two new and promising ledges have been found in that section. The first is located on Barney gulch and was discovered by John Day, and the other on Rich gulch was located by a man named Abbott. Both lodes are said to be well defined and prospect "way up." East Fork promises to become one of the richest and most extensive quartz district on the coast. It is said that more paying rock is now in sight in that district than was ever before known with a like amount of work. It is a splendid field for prospectors.

WATER THROUGH.—A note from Supt. E. M. Benjamin of the Hayes Red Hill gold mines informs us that the water of Canyon creek was put through the pipe, across the suspension bridge, to the opposite side of Trinity river at 27 minutes past 1 o'clock on January 27th, and that he soon expected to commence active operations. Suggestions are made relative to a pack-train loaded with bullion and a branch office of Wells, Fargo & Co., all of which we hope may be realized. The owners and managers of this property are to be congratulated upon the success attending their labors thus far.

BRUNSWICK.—Report has reacbed here that the Cannon Ball mill on the Brunswick mine in French gulch district was started up last Monday. As most of the stock in the mine is held in this county, lively times are anticipated as soon as dividends are declared.

DEADWOOD AND EASTMAN GULCHES.—Cor. Trinity *Journal*, Jan. 31: About one mile and a half above the town of Lewiston you approach the mouth of Deadwood, which runs in a northeasterly and southwesterly direction. At the distance of three or four miles from its mouth you enter into the extensive rich belt where is situated the various mines that have paid such enormous dividends since their discovery. It is needless for me to mention the progress of those mines that have so long been in existence and yielded bullion so fabulously, but speak principally of those that are young and recent in this new and promised land of quartz. John E. Gibson, is the owner of the extension of the Black Bear, which is leased by Wm. Blagrave, who is extracting as rich ore as ever was found in the original Black Bear. Next comes Frank Balleau. His ledge in the shaft looks immense and will soon be tapped by a lower tunnel. Perhaps some one would be anxious to hear from Billy Lappin, the owner of the Boston mine. He gets out about 20 tons of ore every season. The lode is about three feet in width and pays well. Otis J. Collopy is the owner of the adjoining location which looks encouraging in every respect. He has ceased operations until spring, owing to inconveniences attached to the mine. Dr. A. F. Lambeth, ex-Supt. of the Brown Bear mine, still resides in Deadwood. He is held here in consequence of a prospect in which he is half owner. The mine looks well in every particular, but Mr. Lambeth wishes to dispose of his share in consequence of soon being called to take charge of the well-known Saint Anne mine in Mexico. Traveling northward over the dividing ridge you enter Eastman gulch, the hills of which look rich with formation that greatly sympathizes with that of Deadwood. On Shooter gulch (a fork of Eastman) are located Hulbert & Newman, who bave very recently extracted ore that goes into the thousands. It is needless for me to mention in particular all the mines and prospects tbat abound in almost endless numbers throughout the white pine hills of Deadwood and Eastman gulch. But, in conclusion, I will say that our country is as yet unprospected and only time will tell the tale of millions hidden beneath our soil.

DEPTH.—Trinity *Journal*, Jan 31: The Brown Bear mine, in Deadwood district, which has paid handsomely for several years past, yielded its best rock at about 350 feet below the surface and they are now getting good ore on the 400-foot level. In the Barted mine, Deadwood, owned by McDonald Bros. & Franck, the richest rock was taken out from about 200 feet deep and a shaft from that level has been sunk 80 feet without any indication of pay giving out.

NEW RIVER.—*Times-Telephone*, Jan. 30: From letters dated at New River, and people who bave come from there within a week, we ascertain that either in the mines, on Happy Camp hill or at Berry's there was less than six inches of snow, and that it was melting very fast. Prospecting operations have been but little retarded and recent developments in some of the locations are of the most encouraging character. The Mary Blane, Uncle Sam, Ridgeway, Hard Tack and Mountain Boomer owners are particularly enthusiastic. George Dean, who is superintending operations at the Ridgeway, is moving the ore to be crusbed in the Mountain Boomer arastra. Other claims owned by citizens of Eureka, are beginning to attract the attention of those who desire to invest.

Tuolumne.

WORKING UNDER A DWELLING.—Tuolumne *Independent*, Jan 31: We learn that a party of Chinamen have purchased, of George Hale, the ground under his dwelling and the lumberyard buildings, in Columbia, for mining purposes. The price paid is $3,000, the privilege being reserved of leaving the dwelling undisturbed for three years. Success in pocket-mining on Brown's Flat still continues.

NEVADA.

Washoe District.

GOULD AND CURRY.—*Enterprise*, Jan. 31: All work below the Sutro tunnel level has been discontinued, and the tracks, air pipe and the like hoisted out. They are now cutting out a joint station on the 1000 level of the Gould and Curry or Bonner shaft. When completed the Gould and Curry will run a north lateral drift to the Best and Belcher south line, when the latter will continue it through its own ground. Superintendent Lyman says: "The 1000 level has never been prospected in any direction by the Gould and Curry or Best and Belcher companies."

HALE AND NORCROSS.—The west cross-cut No. 2 on the 2800 level is still being advanced in solid quartz, which is metal-bearing and of a most promising appearance in every respect. It is expected that the ore streak found in No. 1 cross-cut will soon be encountered. A drift is now being run from the Chollar main west drift on the 3000 level to connect with the bottom of the main winze. As soon as this connection has been made all will be open to exploration from the 3000 level to the surface.

OPHIR.—The water is fast draining out from the old Mexican shaft and the surrounding ground on the 500 level. The north lateral drift on the 500 level is being advanced rapidly. It is being run along the west wall and will be continued through the Mexican and Union Consolidated ground. The company continues to extract considerable ore from the 250 level.

BEST AND BELCHER.—A joint Gould and Curry station is being cut out at the 1000 level of the Bonner shaft, and is nearly completed. From this the Gould and Curry will run a north lateral drift to the Best and Belcher line, when the latter company will take the drift and extend it through their own ground.

COMBINATION SHAFT.—The new hydraulic pump on the 3000 level is now running very smoothly and well, thoroughly doing all the work required of it. The main west drift on the 3000 level of the Chollar has been stopped, and a branch drift started directly toward the bottom of the Hale and Norcross winze.

SIERRA NEVADA.—The mine has been dismantled below the Sutro tunnel level. Preliminary operations have been commenced on Cedar Hill in the old Sacramento ground, and work will be started at other points in the same locality.

SAVAGE.—The E-street tunnel is passing through the old stopes, but it is slow work, as the ground is a good deal caved. They expect to find ground containing low-grade ore that will pay for working.

YELLOW JACKET.—The old upper levels still continue to yield a large amount of low-grade ore, which is sent to the mills on the Carson river for reduction. Explorations are being made in various parts of the mine.

CROWN POINT.—A large amount of low-grade ore is being extracted and sent to the mills on the Carson river. A considerable amount of prospecting is being done at various points for the purpose of opening out new deposits.

CON. CALIFORNIA AND VIRGINIA.—Good progress is being made in the work of repairing the main drift on the 1550 level, and some preparatory work is being done at other points in the old workings.

MEXICAN.—A drift running north from the Ophir on the 500 level is nearly completed. The drift is for the purpose of exploring ground passed by in early days.

BELCHER.—They are extracting the usual amount of low-grade ore and shipping it to the mills. A large amount of good paying ore is still in sight.

UNION CONSOLIDATED.—A drift has been run north from the Ophir on the 500 level which will open up a large area of ground hitherto unexplored.

Bernice District.

A PROSPEROUS CAMP.—Cor. Reno *Gazette*, Feb. 2: Bernice mining district is creating a stir in this part of the country. Bernice is 70 miles to the southeast of Lovelock and is reached only by private conveyance. The Crown Prince contains three tunnels at a distance of 100 feet from each other up the hill, and averaging 400 feet in length. In these tunnels are 500 tons of fine ore ready to be taken out

without deadwork, and an estimate of how much more lies behind it cannot be made. We were shown the essaying receipt of Peterson & Co., of San Francisco, for eight bars of bullion; they ran from 902 to 961 fine. As 900 fine is mint coinage, we can form an idea of what kind of bullioo Beroice produces. The assayers claim it to be the finest silver shipped from Nevada. The five-stamp mill oow on the ground is running night and day, and the prospects warrant the owners erecting a ten-stamp in the spring. The Crown Prince employs a force of 70 men at present, and as this force can easily keep the machinery in motion, we would not advise any person seeking employment to go there for it.

Columbus District.

MOUNT DIABLO.—*True Fissure*, Jan 30: The north crosscut on the sixth level is now in 143 ft, and the west drift on the same level is in 91 ft. The west drift on the fifth level has been extended 10 ft during the week, and has shown 18 inches of $50 ore for the distance, the face still looking promising. The raise from this drift is up 57 ft and shows some $50 ore. A winze has been started from the fifth level, near winze No. 1 on a small streak of $60 ore. The intermediate drift between the fourth and fifth levels, that is being driven to connect with raise from the fifth level, has now 55 ft to go. Some $40 ore is being taken from the fourth level, and some ore of good grade is being stoped from between the third and fourth levels near winze No. 4. The stope east of the shaft, between the second and third levels, is looking well and giving some ore of high grade. The stope west of shaft, between the same levels, is yielding considerable $60 ore and looks promising. The various stopes in the upper part of the mine are looking about the same and are giving some ore of fair grades. The team began hauling ore on the 28th inst, and the mill will start up in about a week.

Cottonwood District.

NICKEL AND COBALT MINES.—*Silver State*, Jan. 31: The Cottonwood nickel and cobalt mines in Cottonwood canyon, Churchill county, a little south of the Humboldt line, are attracting the attention of French capitalists. The mines in that section, owned by George Lovelock, are bonded to San Francisco men, who are negotiating with Frenchmen for their purchase. One of these mines have been worked somewhat extensively, and some 65 tons of the ore sent to San Francisco sold for over $100 per ton. The ore is more valuable for the cobalt than for the nickel it contains, as cobalt is used for various purposes, and the principal mines of that ore are in New Calladonia, a French penal colony in the South Pacific. Yesterday Professors Keyes and Hirsh, two noted mining experts, arrived at Lovelock from San Francisco, and went to the mines to make a thorough examination of them.

Spruce Mountain District.

IN CAMP.—Eureka *Leader*, Jan. 27: Pat McBride who has for the past two months been at work in the new camp of Jasper, near the old mines of Spruce mountain, gives us the following information: The largest owner in the camp is Barney Harell, a wealthy cattleman, and with the help of Mr. Scherff, they have succeeded in opening up what promises soon to be a good camp. The mines are worked through two tunnels 700 feet in length. The ledge averages in thickness, from 12 to 14 feet, and the ore is of a medium grade, in appearance it is like the Richmond of this place. There is now on the dump at the mine 200 tons of ore, and up to a few days ago the company gave employment to 15 men at the mine. The distance from the mine to the furnace, is three miles, At the furnace there is 100 tons of ore ready to be smelted. The furnace is of 20 tons capacity, and gives support to quite a little town. The company has let a contract for the delivery of 50,000 bushels of charcoal and 500 cords of wood. It was the original intention of the company to have the furnace in operation the first of January, but the severeness of the weather prevented the supplies being furnished, and now the company will not start till the first of May.

ARIZONA.

HUMBUG.—Prescott *Courier*, Jan. 28: Representative Connell has a letter from Mr. Ensign, of Humbug mining district, in this county, in which it is stated that Smithline Bros. have 20 tons of $700 ore ready for shipment to Benson. Wager Bros. have arranged for the sinking of a 150-ft tunnel in one of their mines. Other owners of mines are taking out rich ore. Messrs. Church & Gray, mining engineers and assayers of Prescott, have engaged men to work a mine they own in Turkey creek districts. Tools and provisions were sent out yesterday. A note from Hon. A. W. Callen informs us of the fact that his men are taking out considerable gold near Walnut Grove. The Conger mill is crushing gold ore. A clean up will soon be made.

PLACER.—*Silver Belt*, Jan 30: John P. Chaffin and C. B. Philips have located a placer digging about three miles south of Globe and for more than a month have been engaged in taking out a ditch from Pinal creek, which when completed will be a mile and a half in length and carrying 30 inches of water. They believe so firmly that they have a rich claim, that they have hired men to assist in the work. It will probably be a month yet before the ditch is finished and sluicing can be commenced. Considerable gold has, from time to time been found in arroyos south of town.

CHIMNEY PEAK.—Arizona *Sentinel* Jan. 30: S. W. Fowler, of the Fowler mine Chimney Peak district, was in town last Monday on his way to Los Angeles in the interest of his mine. The Fowler mine as far as gone, shows up as well as any mine in the district, or in Arizona; is located about 21 miles northeast of Yuma, and the ore assays about $700 to the ton. Mr. Fowler has some specimens with him which he will have assayed at Los Angeles. Among other items he told us that the Rabbit mine, adjoining his, assayed equally as well. Mr. Fowler will return next Monday. He has Freeman Neahr associated with him, and they will develop the mine to its fullest extent before they will place it in market.

SILVER.—The Guadalupe mine in Silver district, is now being worked. Three men are constantly employed, and make about one shipment every two months to the Selby Smelting Company of San Francisco. The Guadalupe is owned by Paul Billeck, who is now adjoining in Yuma for a few days, Billeck & Vomoceli have discontinued chloriding at the Black Rock mine for the present. They have on hand 14 tons of galena ore which they will forward to the Selby Smelting Company in San Francisco, at once. Frank Vomoceli and Paul Billeck have re-located eight mining claims formerly belonging to the Castle Dome Mining Company, and are now prospecting them. Thos. Goodman was the lucky finder of gold bearing quartz about 12 miles back of Ehrenberg. The find is reported extraordinarily rich. Two ingots of silver bullion weigbing 305 pounds, and valued at $4,100, passed through this place for San Francisco last Wednesday. The bullion came from the Clip mine. A Yaqui Indian brought in $24.60 worth of gold dust last Wednesday the result of three days' work in dry placer mining, about four miles south of Gila City. The gold was sold at the rate of $18 per ounce.

OLD DOMINION COPPER CO.—*Silver Belt*, Jan. 31: Both of the company's furnaces have been in blast for a week and will continue to run as long as there is a supply of fuel on hand. There are now about 300 tons of coke in the bins at the smelter, and a large supply on the road, between Willcox & Globe, which will be arriving freely within a few days. All the ore from the Old Globe mine is now delivered through the tunnel, into the new bins, at least a quarter of a mile nearer to the smelter than formerly. By this change the company has been enabled to make a more favorable contract for the hauling of ore to the smelter. The new ore cars, six in number have been brought into use to fetch the ore from the mine. Three of them, with a capacity of two tons each, are fastened together and drawn by a mule to the trestle, where one man handles them and dumps the ore into the bins. Full shifts are now being worked in the mine, and the ore bodies look well. The prospect of a long run is certainly encouraging, as the Old Dominion Company is so important a factor in the prosperity of the camp.

GOOD RETURNS.—Lidolph & Co have received returns from 26 tons of Golden Eagle ore which was run through the Miami mill by S. Tidwell. The 26 tons yielded in gold $1,603.16. This is $61.66 per ton and is a remarkable result when compared with the battery sample which was $62. The Golden Eagle is one of the most valuable gold properties in this county. S. Klien & Co., will ship the bullion to-day to San Francisco.

COLORADO.

SPRINGDALE.—Cor. *News and Banner*, Jan. 30: This camp has been practically dead for the last five years. It is not really dead, but has been taking a long sleep, from which it begins to show signs of awakening. 'Tis said that every ten years brings a boom to a mining camp. Whether this is true or not, is immaterial. What we really do need is judicious development of the many promising mines, and prospects of the camp. Various causes have conspired against our mines. Owners unable to work their mines except in a small way, have held them at large prices; there has been much litigation; and there are no mills near by for the treatment of low-grade ores. There has been no deep mining done here; little ore except high-grade tellurium has been sold and most of the low-grade ore has gone into the dumps. In many cases the low-grade ore should be an important item of profit. Among the mines here which have been the largest producers are the Big Blossom, Ellen, Gladiator, Grand Central, J. Alden, King William, Rip Van Dam, Victor, Twin Blossom, Earl, Badger and Lily of the West. There is not a shaft on any of these claims that is more than 120 feet deep, and as near as I can ascertain some $40,000 has been taken out of their workings. There are many other claims, and various amounts of development upon them, but in my humble opinion $40,000 would more than pay for making every shaft, drift, adit and stope in Springdale.

AMONG THE MINES.—Georgetown *Courier*, Jan. 29: A new mining concentrator has been placed in the public ore market at Idaho. The Campbell smelting works at Idaho have shut up shop again, No funds to pay the workmen. About 15 men are employed in the Maine mine, nearly all of whom are in pay and some in big pay. The lessees on the Wolverine, who are driving the 500-foot adit ahead, have about 100 sacks of ore ready for shipment. Van Syckle & Co.'s lease on the Red Elephant is turning out some splendid ore, and is paying as well as any other on the mountain. Twenty-five or thirty men will be placed at work on the Summit mine in the spring. The work at present is confined to driving the tunnel. Between 200 and 300 pounds of float ore gathered near the Kirtley mine, was milled in Georgetown last Saturday, returning 1,670 ounces silver per ton, Husted & Co., on the Windsor lode, Empire, have between two and three feet of stamp-mill ore which runs well. The streak is improving with development. The new plant of machinery on the Joe Reynolds was put in motion last week. About 175 men are now at work on the properties and the production is steady. A contract is to be let on the Brittanica tunnel, Democrat mountain. The tunnel is in 375 feet and is run to cut the Muscovite lode. It is owned by Mr. T. W. Jones. Hensley & Co., lessees on the Range Line lode, Capital mountain, have a continuous vein of solid ore in the lower west level, from six to eight inches in thickness, which mills without sorting, 150 ounces.

IDAHO.

LOST RIVER NOTES.—Houston *Press*, Jan. 28: The Big Copper Mining Company are working quite a force of men, developing their property, and are taking out very high-grade ore. This property is showing up first-class and by spring there will be a large amount of ore accumulated on the dumps ready for the furnaces. The Grand Prize mine are pushing ahead with their work vigorously, and are extracting a fine quality of ore from the 130-foot level. On the Rio Grande gulch considerable work is being done on various mines by Jones, Ferguson and others and the mines in that section are looking well.

FROM BOULDER.—*Keystone*, Jan. 28: Messrs. Murdock and Stone, who went up to the Boulder mines Monday last, returned Thursday evening. They report that a number of relocations were made after January 1st, among them the Boston Run, formerly the Puzzler, was relocated by Chas. Schickran and John Hallett. They are at work on it, and it is already developing into a four foot ledge, and ten inches of clear galena. The Jessie and Ellen have also been relocated by the same parties. The Jessie has an eight-foot ledge of quartz and galena. The above named gentlemen will work all winter on their prospects. There are two men at work on the Belcher. A remarkable feature of the Boulder district is that there is no snow-slides above the mines, and never have been so far as known.

BULLION.—On Monday evening, four bars of Vienna mill bullion came in on the Vienna stage. They were numbered 235 to 238; bars 239 and 240 were on the stage following, and 241 last evening. The mill we learn from parties down in Vienna, is running with its same regularity, and doing well in the production of silver brick.

MONTANA.

FROM BANNACK.—Cor. *Inter-Mountain*, Jan. 27: Messrs. Howe & Selfridge are running a bedrock ditch at the mouth of Sage Brush gulch. They are now 20 ft deep, and expect to strike bedrock in another 100 ft. Rich tributary gulches were worked above them several years ago, and the prospects for another rich find are good. Beaverhead county is not half prospected, and in less than three years will prove to be one of the richest counties in Montana. S. H. Haps has 10 men working on Netta and Kent lodes, in Blue Wing district, and has out now ready for shipment over 400 sacks of good ore. The Bismarck Lode has been leased by Thomas Hancock & Co., and has a fine showing of right good ore. Cochran & Co, are hauling ore from their Lost Cloud mine, Elk Horn district, and have plenty of it. The Delmonte is a fine property and a steady producer of good grade ore.

BONDED.—Butte *Miner*, Jan 24: The Chattanooga is a fraction adjoining the Pacific Slope lode on the west and the Gambrinus on the east. The lead is a continuation of the Gagnon. The property is owned by Robt. McMinn, and was leased on Wednesday last to McNulty & Co. for 18 months, one-fourth of the ore extracted to go as royalty to the owners. The mine was also bonded for 8 months for $15,000 to the same parties. The main shaft is down about 90 ft, another down 45 ft and one about 14 ft on a 12-ft vein of ore, which assays about $19 or $20. The gold product of ore is about $7 per ton, the balance in silver and copper. This $19 assay is made from ore taken in the face, through rock and talc. The company will erect a new steam hoist and begin at once the sinking of a new double compartment shaft. The very richest specimens come from the mine, but so far no sorting has taken place. The Rock Island is owned by Steward & Hickey and has been prospected for some time. The main shaft is down 150 ft. A regular force of men are employed taking out ore and prosecuting development. They use a whim and will sink to the 200 ft levels. The average assay of ore now being extracted shows 60 ounces of silver. The Little Daisy owned by Mr. H. A. Kerns, of the New World mining district, is turning out some wonderfully rich gold, silver and galena ore. A tunnel has been run in 80 ft and will be driven to a full distance of 290 ft where it will tap the main vein at a depth of 250 ft. Three blind leads have been crossed in the 80 ft run, each going from 2½ to 4 ft in width and carrying the richest of ore, Mr. Kerns showed considerable of the ore yesterday and we find it abundantly covered with free gold which stands out prominently from the face. Sulphurets and galena are also readily discerned. Brittle silver and carbonate of iron is strongly noticeable in many pieces. Mr. K. has struck three other leads in the same vicinity and will open them all in the spring. Every one who returns from this new camp, whether successful or unfortunate speak in the highest terms of its splendid future.

NEW MEXICO.

GOLD HILL.—*Advance*, Jan 27: The Gold Hill claims show up as folllows: Powhattan, Hood and Doane, have a claim that runs $100 in gold, with two tons of ore on the dump. The Grover Cleveland, owned by Winters, shaft 10 ft, black sulphurets and chlorides, assays $800. The Homestead claim of McCone, Keister & Hargrave, with 13 ft of work, runs over $100 in gold and silver. Ringgold claim, McCone & Keister, have a 30 ft cut 8 ft deep that mill runs $78 in gold and $8.28 in silver. Winter's claim, owned by Clair, Classen and Kellum, have a 25 ft shaft and 1 ft ledge that runs over $100 in gold. Schneider, Hart & Co. own the Early Morning and Ruby claims. Shafts on each 6 ft deep, show rich metal that runs $200; ledge 2 ft and improving. The Reservation, owned by Sterling & Cunningham, has 2 shafts on it, respectively 18 and 8 ft. Assays in this claim run as high as $800 in gold and silver. There have been a dozen miners in from Gold Hill this week for ore sacks. There will be 1,000 tons of ore hauled here for shipment from Gold Hill in less than two months. The Yankee Girl, owned by Goodwin & Co., 20 and 10 ft each, with leads 1 ft in width, mill runs over $190. Have a carload sacked ready for shipment; ore rich sulphurets, chlorides and native silver. The Grand Tower, Lewis & Cottrell, near the pass between Lordsburg and Silver City, are sacking ore from croppings. The claim shows good mineral assaying from $100 to $1,000; ore manganese, horn and native silver.

GENERAL NOTES.—Silver City *Enterprise*, Jan. 31: The hoist and other machinery for the Old Man mine arrived in town on Saturday last and will be placed in position as soon as possible. An enlarged force of men will then be put to work on the mine. Williams brothers and E. G. Shields have a carload of first-class Sherman ore ready for shipment. The lower grade ore from this property will be concentrated at the works in this city when they start, if satisfactory arrangements can be made. It is reported that Capt. M. Cooney has perfected arrangements to erect a 10 or 20-stamp mill upon his property in the Mongollons. J. D. Caughran, president of the company, is now in Denver arranging for the purchase of machinery. Joe E. Sheridan on his new location on the Slayback, in the Mongollons, has six to ten feet of quartz that runs from $18 to $36 per ton in free gold is trying to make arrangements to build a mill of large dimensions to mill it. It is free milling and can be mined and milled for five dollars per ton, so that ten dollar rock will return a large profit. The Milwaukee company which has been operating in the Tres Hermanas, under the management of Mr. Fletcher, has at that gentleman's instance put up a furnace to reduce the ores of the camp. It has just been completed and is of the "Serpentone" pattern, being nothing more or less than the old-fashioned Scotch hearth, with an inclined reverberatory chamber leading upward from it to the stack, a distance of about 15 or 20 feet, as near as the writer can remember. The Hancock mine, in Tres Hermanas, which until lately was the property of Messrs. Meredith & Allman, of this city, has passed into other hands. E. G. Shields and Williams brothers are working five men on the Sherman mine and are taking from four to five tons of ore a day. This mine is probably one of the best showings in Grant county to-day. About 14 feet south of the main shaft on the tunnel level there is a body of fine chlorides or horn silver that will average $250 per ton. The ledge is about six feet wide, carrying horn silver. The late discoveries of additional immense ore bodies in the mines at Victorio have greatly increased the value of ore shipments from that camp. Both of the companies operating there are producing large quantities of a splendid grade of carbonate ore, and from the amount in sight it is safe to predict that the present shipments can be kept up for a long time. Never in fact since the discovery of mines has the ore outlook been so flattering. Vast bodies, many feet in hight, and from 15 to 20 feet thick in many places are exposed while the development work is adding fresh reserves to those now being drawn upon. Last year the product of the camp amounted to $275,000, but the yield for 1885 promises to reach if it does not exceed a half a million. For a place about which so little is heard Victorio is a marvel. The camp since its commencement as a producer of ore has excelled any individual camp in the county.

OREGON.

PLACERS AND QUARTZ.—Jacksonville *Times*, Jan. 31: T. J. Keatts and C. J. Armstrong have located a promising quartz ledge in Willow Springs precinct. Considerable prospecting is being done in this region, as our quartz interests are again attracting some attention. Ingram & Dean are still at work, though their supply of water has diminished perceptibly during the past week. D. L. Curtis has leased the mining ground he purchased of the late Sam Bowden, situated on Jackson creek, to a Chinese company. Oscar Swacker of Foots creek informs us that the miners of that section have done some work, but need more rain badly at present. W. H. Benner & Co. of Willow Springs district have their mines in excellent condition for an extensive run and are doing some work. Considerable mining is going on in the Sardine creek district. B. F. Miller's mines are being worked this season by parties from this vicinity. McCullough & Co. continue to take out rich quartz from their ledge in Willow Springs precinct. We were shown a very fine specimen of it last Saturday. L. D. Montgomery has purchased Chas. Baer's interest in Levens & Co.'s mines in the Coyote creek district. Considerable work has already been done there. A. W. Sturgis, the indefatigable miner of Forest creek, has done considerable work already. He informs us that he recently completed a new piece of ditch, which affords him more water, Newell DeLamatter of Kirbyville, informs us that the miners of Josephine county have had an excellent run so far, but that the water supply is slacking up in many places at present. No doubt a good report will come from the mines of that section this season.

UTAH.

REVIEW.—Salt Lake *Tribune*, Jan. 30: The week has been rather stormy, with unusual depth of snow in the valleys, but this has made very little interruption or delay in the chief thoroughfares. The shipments of ore and bullion from this city for the week ending Saturday, January 24th, were as follows: One car of refined lead, 22,056 pounds; 7 cars ore, 199,230 pounds; 25 cars bullion, 544,666 pounds; total, 33 cars, 765,952 pounds. The receipt of bullion and ore in this city for the week ending January 28th, inclusive, were $94,402.06, of which $70,171 was bullion, and $24,331 was ore, an unusually high percentage of the latter to the whole. The week before the total receipts were $99,381.08, of which $78,549.08 was bullion and $20,632 was ore. The unfortunate burning of the Hanauer smelter makes a material shrinkage in the output of bullion; but when it begins anew, with increased capacity, its effect in the opposite direction will be still more marked. The Horn Silver is still shipping its usual quantity of ore to the smelters, and making the average amount of bullion; but it is piled up at the works instead of being shipped. The product of the Ontario for the week was 24 bars, of the value of $17,251.21; total for 1885 to date, $125,574.98. The Ontario opens the year with a monthly dividend of 50 cents per share, payable on the 26th inst., in New York, amounting to $75,000. This is the 103d monthly dividend of 50 cents per share, and brings the total of dividends up to $6,125,000. The Germania smelter produced ten cars of bullion, $22,849.85 cents during the week. Silver Reef sent up $8,560 in silver bars, of which the Christy produced four, valued at $6,850 and the Stormont one, $1,710.

STAR DISTRICT.—Southern Utah *Times*, Jan. 31: The Martin Bros. were in from Star on Thursday. They report mining in that district active. There are more men at work and prospecting than for many years past. The Don is being actively developed by its owners. Mr. Campbell has six men at work on the Moscow, the mine he recently bonded, besides a force on the Red Warrior. The Martin Bros. are doing profitable work on some of their mines. It is now confidently asserted that Mr. Campbell will shortly erect a concentrator and leeching works in Milford. If such be the case, it will be the means of creating a mining boom for Star, equal to, if not greater, than that of '72 and '73. With the proper facilities for the reduction of ores, Star is capable of supporting more men than any other district in Beaver county, not excepting San Francisco district, the seat of the justly famous Horn Silver mine. Pluck, labor and a little capital are all that is necessary to bring the state of things about. Bowen, Ormond et al. are doing satisfactory work on their mine, the "Don," in Star district. They are taking out some very rich carbonate ore. Bingham, Utah, the past year, witnessed an output of 25,000 tons. It is now an assured fact that the Comet mine, in Copper gulch, will be thoroughly prospected the coming spring and summer. The French company who own it, we understand, have placed $75,000 to the credit of the working capital, but long before the above sum is expended, the public will be prepared to hear that the Comet has been developed into a veritable bonanza,

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

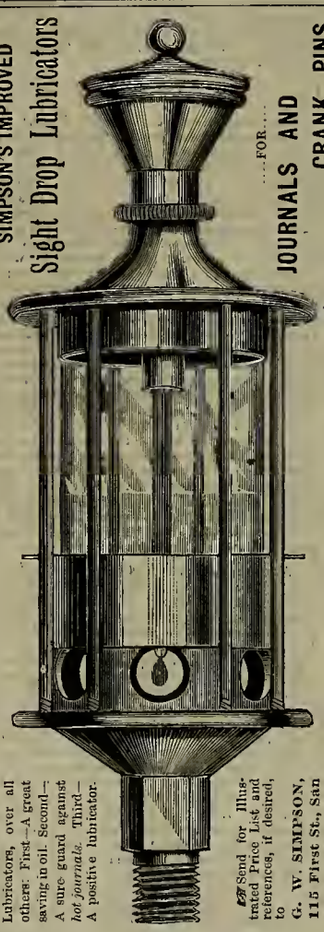
Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be disconnected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

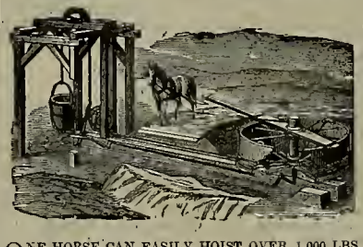
SIMPSON'S IMPROVED Sight Drop Lubricators FOR JOURNALS AND CRANK PINS.



I claim for these Lubricators, over all others: First—A great saving in oil. Second—A sure guard against *hot journals.* Third—A positive lubricator.

☞ Send for Illustrated Price List and references, if desired, to G. W. SIMPSON, 115 First St., San Francisco, Cal.

MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

The Silver Conventions.

When the "National Silver Convention" met at Denver on the 28th inst, there were over 1,400 people present, fully two-thirds of whom were delegates. Every county but two in Colorado was represented by large delegations and there were smaller delegations present from Utah, Wyoming, Idaho, New Mexico and Kansas. The first two days were taken up in organization business, and part of the meeting was rather stormy owing to the difference of opinion as to the permanent chairman. Governor Eaton was finally chosen. The majority report of the Committee on Resolutions was finally adopted and passed by unanimous vote. These resolutions are as follows:

The States and Territories of Kansas, Colorado, Utah, New Mexico, Idaho, Wyoming and Arizona in convention assembled at Denver, Colorado, January 28, 1885, adopted the following resolutions as a declaration of principles:

First—That we are in favor of the doctrine of himetallism as embodied in the laws of the United States previous to 1873, and we urge the re-enactment of those laws at the earliest practicable moment.

Second—That in the interests of trade and commerce we demand the free and unlimited coinage of gold and silver bullion at the present standard of coinage.

Third—We demand that Congress shall pass an act directing the Secretary of the Treasury to withdraw from circulation all one and two dollar bills, in order to give a larger circulation to the standard dollar.

Fourth—We condemn the Secretaries of the Treasury for their unlawful evasions of the provisions of the Bland hill, and demand that clearing-house balances and obligations of ths government be paid, without discrimination, in gold and silver or gold and silver certificates.

Fifth—*Resolved*, That it is the sense of this convention that the law amendatory of the national hank act be enacted, whereby said hanks throughout the United States shall keep not less than fifteen per cent of the legal reserves in national standard silver coin, and also the redemption fund of said hanks shall be in silver coin.

Sixth—That until Congress shall restore silver to its ancient rightful and constitutional equality with gold in respect to coinage, we demand a liheral construction and faithful execution of the provisions of the Bland hill.

Seventh—That the demands and recommendations about to be made are based on hroader grounds than any consideration of mere sectionalism or the protection of a particular industry; that there are well-nigh forgotten terms of that wise constitution and laws under which this nation has gained its place as the foremost people of the globe; that silver needs no such protection as is extended to the pampered industries of the East; that this question touches the dearest interests of every human heing in this hroad land, and that it involves the question of whether the deht-payiug medium of the nation shall be so changed as to increase the valus of notes, hond, mortgages and other fixed incomes, and depreciate the value of all other property and also involve the proper execution of our constitution and our laws.

H. C. Snyder, of Kansas, offered the following resolution, which was adopted:

WHEREAS, The material and commercial interests of the Southern and Western portions of this nation are of great importance to the prosperity of the whole nation, and

WHEREAS, The Secretary of the Treasury sways the financial power of the administration, and has seemed to possess power to almost nullify the acts of Congress, as is notably instanced in the manner in which the Treasury has been administered since the passage of the act known as the Bland silver bill.

Resolved, That the Silver Convention, composed of delegates from several States and Territories, of all political opinions and complexions, earnestly request President-elect Grover Cleveland to select some statesman for Secretary of the Treasury who will not be in the interests of the national banks and Eastern brokers, but will recognize the great interests of the South and the West in shaping the financial policy of the administration, and strive to promote the interests of the whole people instead of consulting the wishes of the magnates of Wall street.

A copy of the resolutions was ordered to he sent to President-elect Cleveland.

A committee appointed to consider a plan for a national silver association mads its report, which was adopted. It declares that the purposes of the association shall he the securing of such national legislation and aotion as will make effectual the recommendations and principles promulgated hy this convention upon the coinage of silver. The name of the orgauization shall he "The National Bimetallic Association." A preliminary committee of fifteen from the States represented was appointed to prepars a memorial address, embodying principles declared by this convention on the subject of the coinage of silver currency. It provides for a national committee, who are empowered to call a national convention, fix the basis of representation therein, and perform all the duties incident to their office. The preliminary committee is required to enter upon the discharge of its duties without delay. The convention adjourned siue die.

It was remarked that the great "Silver State" of Nevada was not represented at the Denver convention, hut that State has held a convention of its own at Carson, adjourning on Saturday night last. There was a good representation, and suitable resoltions were adopted. These we shall give in full in next week's PRESS. Immediately after adjournment the Nevada Silver Production and Reduction Association was organized by the election of the following named officers: C. C. Stovenson, President; Robert Briggs, Vice-President; A. C. Pratt, Secretary; Evan Williams, Treasurer; M. D. Foley, H. G. Parker, G. H. Thoma, Trustees; G. H. Morrison, T. J. Bell and J. Dennis, Finance Committee. Messrs. Foley, Liddle and Briggs were appointed a Committee on By-laws, whereupon the association adjourned, to meet at 1 P. M. on Saturday, February 7th. Thirty-one gentlemen signed the roll of membership. The initiation fee is $5 and the anuual dues $5.

Mining Share Market.

The stock market does not seem to have recovered from the announcement of the shutting down of all work in the lower levels of the north end of the Comstock. At the north end the Sierra Nevada Company expect to make a good thing from the ore veins possessed by the company at Cedar Hill. The Ophir, Mexican and Union Consolidated are running a drift on the 500 level, and intend to explore a large piece of ground that was neglected years ago. At the Best and Belcher and Gould and Curry they propose to explorea large tract of country on the 1000 level of the Bonner shaft. At Gold Hill and Crown Point, Yellow Jacket and Belcher mines are extracting ore sufficient to keep the mills on the Carson river busy.

Bullion Shipments.

Old Lexington, Jan. 27, $1,600; Alice, 27, $12,736; Lexington, 28, $19,568; Moulton, 28, $18,115; Alice, 30, $12,816; King, 31, $11,079; Alhambra mill, 31, $16,371; Barbers mill, 31, $5,733; Christy, 28, $1,950; Vienna, 28, $1,660; Crescent, 29, $2,800; Vienna, 29, $4,020; Christy, 30, $1,580; Wood River ore, 30, $3,447; Minnie Moore, 31, $3,200; Germania, 31, $4,533; Ontario, Feb. 1, $12,266; Germania, 1, $44,137; Stormont, 1, $3,250; Crescent. 1, $2,200; Idaho ores, 1, $3,900.

During the week ending January 31st, there were shipped from Salt Lake thirty cars of bullion, 660,588 pounds, and twenty cars ore, 549,480 pounds, making a total of fifty cars, aggregating 1,210,068 pounds.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will he called to this (as well as other notices, at times), by turning a leaf.

THE output of ths Drum Lummon mine at Marysville, M. T., is ahout $35,000 per week.

MINING SHAREHOLDERS' DIRECTORY.

HEALD'S BUSINESS COLLEGE, 24 Post St. S. F. Send for Circular.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING JANUARY 27, 1885.

311,235.—ROCK CRUSHER—A. G. & J. M. Dyer, S. F.

311,428.—HAND WEEDER—L. C. Hill, Myrtle Creek, Or.

311,351.—CORN PLANTER—G. H. Meyer, Santa Rosa, Cal.

311,272.—STEPLADDER—L. S. Tibbals, Mission San Jose, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPREADER FOR THRASHERS.—Geo. W. Gould, Yolo Station. No. 316,671. Dated Jan. 13, 1885. The object of this spreader is to effect an even and regular feed of the unthrashed straw to the separator. It consists in the arrangement and combination of various devices.

HOSE COUPLING.—Samuel R. Hackley, Crockett's Station, Contra Costa Co. No. 316,672. Dated Jan. 13, 1885. This hose coupling consists in a tapering male coupling, and a corresponding tapering female coupling, spring latches or dogs in the latter, an annular groove in the former, with which the dogs engage, a packing ring on the male coupling and abutting shoulders on each.

ICE MACHINE.—John C. Kilton, S. F. No. 311,013. Dated Jan. 20, 1885. This invention consists of a tank, within which the freezing medium is contained; a series of wedge-shaped chambers formed within the tank, so as to be surrounded by the freezing medium without connecting with it, these chambers being widest at the bottom, and having relief-pipes for expansion and the discharge of condensed water. Certain details of construction are also covered by the patent.

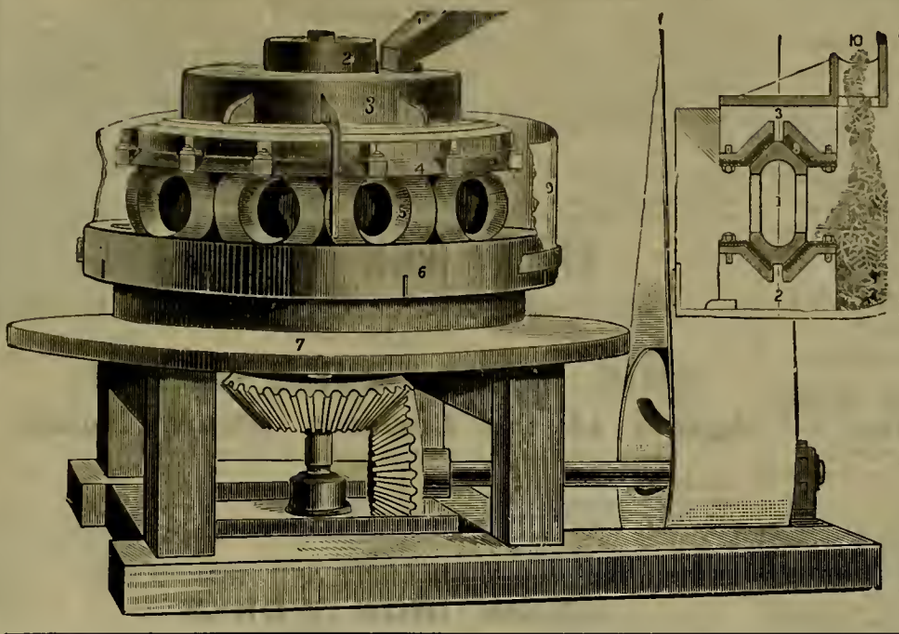
ROCK CRUSHER.—Aaron G. Dyer and James M. Dyer, S. F., No. 310,656. Dated Jan. 13, 1885. This is an improvement on cannon-ball crushers. There is a vertical rotating cone, supporting balls, grooved annular dies, a cylinder surrounding and resting on the cone and having its lower section diverging and corresponding with the exterior surface of the cone, and an independent guide shaft for said cylinder, arranged out of line with the cone-shaft in combination with a guiding chute or hopper, by which the material escaping between the cone and the cylinder is delivered between the balls and dies.

GUIDE FOR BORING DOORS FOR LOCKS.—Chas. F. Nichols. S. F. No. 316,710. Dated Jan. 13, 1885. This new guide for boring doors for locks consists in a frame having adjustable clamps for securing it to the door; in a laterally adjustable standard or rack-bar in the front of the frame, and in a vertically adjustable socket guide for the augur bit, said guide being carried by the rack-bar, and adapted by the lateral adjustment of the bar to the center of the bit, and, by its own vertical movement to direct the bit up and down; and in vertically and horizontally adjustable socket-guide on the side of the frame adapted to receive and direct the augur-bit to make the hole for the knot-shank and the key-hole. The object of the invention is to provide a simple and effective device for accurately boring the holes in a door to prepare it for the lock.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

HILL'S TRIUMPH ORE MILL.

THE KING OF Quartz Mills.



Awarded First Premium Mechanics' Fair, 1884.

Anti-Friction, Light Motive Power, Unequaled Results, A Low-Priced, Perfect and Economical Machine.

WORTHY OF INVESTIGATION.

SURE TO GIVE SATISFACTION.

F. A. HILL,

Inventor and Sole Owner

FIREMANS FUND

INSURANCE COMPANY OF CALIFORNIA.

Assets Dec. 31, 1884, $1,520,894.77

Losses Paid, Over $5,500,000.00

CASH ASSETS, INCOME AND NET SURPLUS, LARGEST OF ALL THE COMPANIES ORGANIZED WEST OF NEW YORK STATE.

By charging Adequate Rates for its Policies, it is enabled to furnish Solid Indemnity to its patrons. It has but about one-third as much at risk in San Francisco, in proportion to assets, as the average of the other home companies, and its popularity is attested by the fact that it does the Largest Business on the Pacific Coast of any Company, American or Foreign.

HOME OFFICE: S. W. Cor. California and Sansome Sts., San Francisco.

AGENTS IN ALL PRINCIPAL LOCALITIES.

HEINE PATENT SAFETY BOILER

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,

(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,

(Signed) W. S. TOWNSEND.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

HOISTING WORKS

Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

Adapted to all Requirements.

VOLUME XLXX. Number 7.

Drilling in Cement.

In La Salle county, Illinois, are beds of hydraulic limestone which are very regular, and the ore worked by the Utica Cement Co. is 16 feet thick. There are two beds, separated by 18 miles of sandstone, but the two beds are worked as one, the sandstone being first cut out and removed to prevent mixture. The rock is obtained entirely by mining underground. Tunnels are driven in the cement-rock, and the interior plan is much the same as a coal mine, laid off in rooms with walls between, connected with the main tunnels or entrances by cross-entries. The rooms are worked 45 feet wide, with 15-feet walls between, the main tunnel having side-walls 25 feet thick. The mining has all been done with pneumatic drills. Mr. Henry C. Freeman, of Alto Pass, Ill., was in charge of the development of the property and designed the plans. In a paper he read not long since before the American Institute of Mining Engineers, describing the method of working, he gave some interesting details of the drilling operations.

After some experimental work, the plan settled upon for mining was to cut out the sandstone and remove it; then blow down the upper or main mass of the cement-rock; and, lastly, raise the two feet of cement-rock below the sandstone. But all the drilling for the face of either a tunnel or a room was done before a shot was fired. The method of working a room and tunnel was the same, and by preference the tunnel was driven wide—about 20 feet—as a matter of economy, excepting at the entrance, which was kept narrow, that it might be readily closed against severe winter weather, and also to lessen the action of frost on the roof.

The drilling commenced anywhere in the face, after the drillers became skillful; but the system indicated a beginning always in the center of the face, a few inches above the sand-stone, —one, two, or three drills occupying the face of a room together. Usually it was divided between two. Two holes were drilled, two and a half feet apart, about two and a half feet deep, and directed obliquely downward and forward, converging so that the two holes would be about four to six inches apart at the bottom, and terminate in the sandstone near the base. Two more holes, four and a half or five feet deep, were drilled like the first pair, starting three inches horizontally from them, and converging as before. A third pair of holes, three inches from the second pair, went in seven feet, and sometimes a fourth pair were put in nine feet in the same manner. These holes were always blasted in pairs, and in the order given, the first pair making a wedge-shaped opening, which the second and third pair deepened to the regular depth of breast, which was usually seven feet for the standard.

The Burleigh drill was used. In the beginning of the work, the "tunnel carriage" which the manufacturers sent out with the drill was employed. It was an unwieldy affair, requiring nine men to move it about, though two (the driller and his helper) were sufficient to use it. The unsuitableness of this carriage led Mr. Freeman to design a totally different one adapted to the work. The accompanying drawings and description exhibit this carriage, which is still in use. As it was not patented, it is free for public use. This carriage suited the work perfectly. It is also adapted for any tunnel-work of ordinary width for a railroad, and down to seven or eight feet wide, by making the carriage specially for narrow work. This carriage, with its drill (weighing together one ton), was handled very easily, either on or off the tracks, by the two men who did the drilling, a pinch-bar being used to shift it into position.

In the accompanying cut, Fig. 1 is a side view, with one end shown partly in section. The drill (not shown in the drawing) is clamped to the long horizontal bar in the usual way. This bar moves up and down freely between the guide-posts of the carriage, being suspended at each end by a chain. A lever working in the ratchet winds or unwinds the chain at each end. The two stancheons shown in position support the drill when in action, and are themselves supported against the floor and roof, and made secure by the long jackscrews in the bottom. A wooden cap is usually laid on top next the roof. On the floor is an iron plate for the screw-head.

Sets of clamps at each end of the drill-bar inclose the two stancheons; and a short jack-screw in each end of the drill-bar is forced out against the stancheon. The drill-bar is then independent of the carriage, and the chain may be slackened. *A* is an end view of the drill-bar looking downward. It shows the lugs that serve as guides on the posts, and the attachment of the clamps, bolted on. A short jack-screw is omitted in the figure. *B* exhibits half of the bottom-frame, showing method of framing and attachment of the posts. The frame is of seasoned white oak, the stanchions of Norway pine. For a ten-feet ceiling an eight-feet stancheon is a convenient length. They are eight inches square.

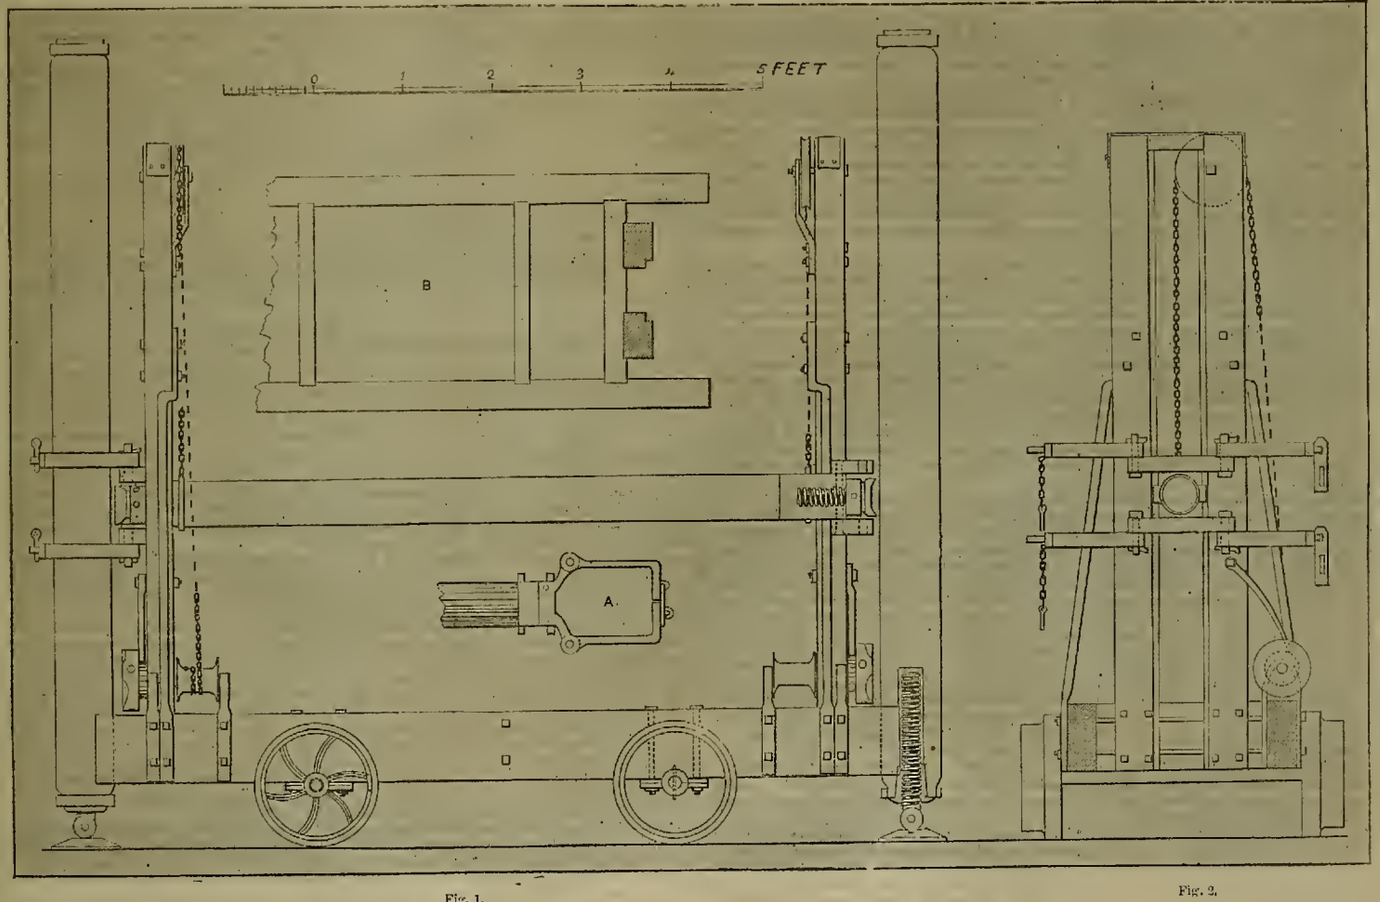

Fig. 1.

Fig. 2.

AN IMPROVED CARRIAGE FOR PNEUMATIC DRILLS IN MINING WORK.

Fig. 2 is an end view of the carriage, with the stancheons omitted and the clamps thrown open.

T rails were used; but as it was inexpedient to have a track close to the face, the flange of the wheel was broadened, so that the wheel had two treads, the lesser diameter to run on the rail, and the greater to run on the rock-floor. The construction of the track was unlike the common practice. Four by six-inch oak scantling, 14 feet long, was framed together by tongue and mortice, the six inch face flat, with three cross-pieces secured with wooden pins. These 14-feet sections were kept in stock, with a few half-lengths. It is a very convenient method for mine-tracks with light rail. The rail has a full bearing its whole length, and a lighter rail can be used.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

New Mexican Mines.

EDITORS PRESS.—Mining matters in New Mexico have decidedly advanced during the year 1884. The general dullness of business in the East has, of course, affected us all more or less. It has been difficult to raise capital for any new enterprise, and the sale of mining property has been well-nigh impossible. But all mines which produced in 1883 have maintained or increased their production in 1884, and many owners of properties, half prospects and half mines, despairing of getting capital wherewith to inaugurate extensive operations, have made the best of the small means at their command in the development of their claims. In consequence, the number of small ore producers has notably increased, and the grand aggregate of New Mexican production has been swelled very considerably. The Cooney mine, in the Mogollon mountains, which produced $30,000 in 1883 produced $100,000 in 1884, and this without additional investment and with the same equipment of a five-stamp mill with two vanners. The Lake Valley companies have produced at the rate of $150,000 per month for the year. The Billing smelter at Socorro, which produced $267,000 in '83, ran its total up to $1,098,000 in 1884, this great production being mainly from its own mine, the Kelly, in the Magdslena mountains. During the year the Cabinet Mining Company, of St. Paul, Minn., purchased first the Torrence mine in Socorro mountain and the Torrence mill, in the city of Socorro; later they bought the splendid Merritt mine in Socorro mountain, and, in my judgment, the best body of milling silver ore in New Mexico.

They are treating now 30 tons per day of Merritt ore, with a net product of $1,000 per day. The Mogollon mines in the neighborhood of the Cooney, encouraged by the success of that mine, have developed energetically. During the past year, the Silver Bar No. 1 North, (Peacock Mining Company) Silver Bar No. 2 North, (Silver Bar Mining Company of St. Louis) Bismarck, Ocean Wave, Blue Bird and other properties, have become small shippers of high grade ores.

The mines at Kingston and Georgetown, near Silver City and Lordsburg, all either maintained or increased their productions. The gold mines of Lincoln county, near this place, increased their production from $24,500, in 1883, to $114,250 in 1884. With good machinery this increase might just as easily have been trebled.

At Los Cerillos, Naciemento, Gallinas, the Ladrones, Tinitlan, Tres Hermanos, Floridas, Bonito, Nogal, Clifton, Grafton, Fairview and Chloride, 1884, was a year of patient and persistent development, and nearly all these camps were small shippers of high grade ores, and in the aggregate to a very considerable amount. The dull years of 1883 and 1884 have forced New Mexican mining on to a legitimate basis. Success has been achieved in the face of deficient capital, debt and doubt. The prospects for the future are therefore bright. New Mexico will not long appeal in vain for capital necessary to the development or extension of any legitimate mining enterprise. She has become a steady producer of the precious and superior metals, and in a very few years may be expected to take her place alongside of Arizona, as a large one.

The coal mining interest in New Mexico, more than doubled its output in 1884. The coke interest more than trebled its sales.

New Mexicans have every reason to feel encouraged, and I may hope at the close of the present year to be able to give still more potent reasons for faith in their future prosperity.

D. J. M. A. JEWETT.

White Oaks, N. M. Jan. 26th.

The Richmond Furnaces.

It does one good these quiet times to visit the Richmond works, and there see the hustle and activity going on. At present, the company is employing some 170 men, all of whom are busy as bees at their various stations. The works are about the most complete to be found on the Coast, and the several departments are conducted with the most practical precision, much to the credit of the foreman, Mr. L. W. Davis. Considerable of the ore being worked is conveyed from the mining sections over a narrow-gauge railroad to the ore-bins at the furnaces. If a piece of machinery at any time breaks, a like piece is generally recast in their foundry, thus doing away with the delay and general inconvenience usually incurred in having to send East or to San Francisco for a fac-simile of the same, and their machine, carpenter and other shops are well equipped with not only the necessary appliances for the speedy and accurate performance of work, but they are supplied with thorough and intelligent workmen.

The various ores received at the works are all scientifically sampled, and their exact properties ascertained by Foreman Davis, who then orders the requisite quantities of each fed to the furnaces, in order to secure a successful reduction of the same. The principal properties in the ores to be ascertained before feeding them to the furnaces, in order to have them advantageously worked, are the litharge, lime, quartz and slag.

At present, three furnaces are running at full blast, two of which have a daily capacity of 50 tons, the other 60 tons. Aside from the ore being shipped to them from the Richmond mine, the following outside properties have made shipments since the 15th instant as follows: From Adam Hill section—Silver Lick mine, 22 tons; Members, 11; Oriental and Belmont, 16½; Herculean, 5; War Eagle, 5; King Lear, 6; Red Bank, 3½. Prospect Mountain—Lord Byron, 98, Excelsior, 5½; Tiger, 2. New York Canyon—Tiger Lily, 6. Ruby Hill—Jackson, 54.—*Eureka Sentinel.*

Arizona as a Gold Country.

Much is said and written every day of our Territory as a silver and copper producer, but little is heard of the immense deposits of gold, in placers as well as in veins, within its borders; in fact the whole Territory is a large placer claim. From as far east as the San Francisco river, where at the present time hydraulic mining is carried on with great success, to the Colorado, the intervening country abounds in placer mines, and the only, but very serious drawback to obtaining their treasures, is the scarcity of water. If this could be obviated, our Territory could vie with California in its palmiest days in pouring into the markets of the world a stream of the yellow blood of industry and commerce (with which, in utility, the blue blood of nobility is nothing in comparison).

In the Santa Rita mountains, the well-known Louisiana gulch has yielded large amounts of coarse placer gold, the quantity of which is only limited by the water supply.

Look at the old placers in the Quijotoa country, so extensively worked by Yaquis and Sonorans some fifty years ago, all done by the dry-washing method, when the yellow dross was carried by the mule load into Mexico. These same placers can only be said to be half worked out, however. Not only in these old grounds, but also in all the flats and ravines, gold is found in largely paying quantities.

The only drawback is want of water, and it can be had by boring; if not in sufficient quantities in the mountains, an abundance can be obtained in the valleys, from whence it may be forced to the proper place. Every valley in Arizona has an underground river.

From the Quijotoa mountains westward to the Colorado river placer gold and gold in quartz is found. South of Yuma are the Picacho gold placers and gold-bearing quartz veins. Out of these placers many and many a hateau has been dry-washed by the Mexicans, yielding from one to six ounces and more.

At Gila City, on the Gila river, large deposits of fine gold have for years been known to exist. Further north, around the celebrated Vulture mine, placer gold is found all over the country, and has been worked by dry-washings. To the northwest is a long and wide gold belt, of which old La Paz, now Ereuburg, is the center, and the quantity of gold taken from them is astonishing.

Eastward again comes the old placers on the Hassayumpa river, of which the most prominent are those of Weaver district, and notably Rich Hill, between Antelope and Weaver creeks, where the gold was found, when discovered in 1863, to lie exposed in nuggets from the size of a pea to several pounds in weight on the bare rock, fully 500 feet above the surrounding country. To the east are the Castle Creek placers, from which much gold has been taken.

On Lyon creek, near Prescott, nature furnishes the gold-hunter with water sufficient for working at least part of the year, and he reaps a good compensation for his pains.

We still have the Black Canyon diggings, known to be rich in gold, and in fact all over our Territory nature has scattered gold with a lavish hand.

Were water facilities in proportion to the gold found, the world at large would soon cease to complain of the constantly-diminishing of the precious metal.—*Arizona Index.*

PROFIT ON MINES AND RAILROADS.—Of all the vast array of corporations whose stocks are listed on the Exchanges of New York with thousands of millions of capitalization, only the following twenty-two of the active stocks pay dividends of over $500,000 per annum, to wit: New York Central, New York and New Haven, Chicago and Alton, Rock Island, Burlington and Quincy, Canadian Pacific, Omaha, Missouri Pacific, Harlem, Oregon Railway and Navigation, St. Paul, Minneapolis and Manitoba, Plymouth Gold, Horn Silver, Northwestern, St. Paul, Lackawanna, Ontario Silver, Western Union Telegraph, Pulman's Palace Car Company, Pacific Mail, Delaware and Hudson, and Illinois Central. The mining companies maintain a fair proportion. The Plymouth Gold and the Horn Silver each pay 12 per cent yearly on their full capital, being a higher rate than is paid by any of the above companies.—*New York Journal of Commerce, Jan. 23d.*

The Manhattan Mine.

The Result of a Year's Work.

The annual meeting of the Manbattan Silver Mining Co (Austin, Nev.) was held last week and the following directors chosen:

A. K. P. Harmon (president), M. B. Pond (vice-president), M. Curtis, B. O. Paxton, E. G. Gibbs. John Crockett was re-elected secretary, and M. Curtis superintendent.

The secretary reported the receipts and disbursements for the year as follows:

RECEIPTS.

From 5204 tons, ass'y, $231 50, val, $1,204,752 88 @ 93.70 46 per cent	$1,128,909 91	
Royalties collected on dump ores	1,788 57	
Gain—Losses of previous years collected	212 50	
		$1,130,910 98

DISBURSEMENTS.

Mining Expenses—Lander shaft mines	$ 228,271 65	
Paxton Inc mines	147,362 75	
Isabella Inc. mines	27,943 79	
Ruby Inc. mines	33,014 30	
Frost compressor & pump shaft	46,063 69	
N. Star pump shaft	2,329 85	
London Inc. mines	2,819 52	
Silver Wedge mines	5,573 68	
Ward Inc. mines	3,087 35	
Low grade ores	9,120 43	
Lone Star mines	11,090 29	
Blue Inc. mines	18,561 31	
Bowman Inc. mines	4,273 48	
Great Eastern mines	3,362 61	
S. F. Tunnel mines	820 55	
Mining Prospect	4,776 98	
Improvements, real estate and properties	68,878 55	
Mining Expenses—reducing 5,204 tons @ $25,392 per ton	132,140 58	
Furnace Royalty on 4514½ tons @ $1 per ton	4,514 50	
Bullion Discount on Manhattan ores	182,175 29	
On custom ores (over collections)	2,408 00	
Custom ores—purchase of 471 tons	88,453 38	
Texas	15,633 69	
Interest	887 40	
Exchange	6,501 45	
Expense	6,324 87	
Insurance	2,823 84	
Mill repairs	10,924 84	
Losses	2,532 00	
		$1,072,002 60
Profit for year		$ 58,248 38

From the report of Melville Curtis, the superintendent, we make the following extracts:

During the year the mill was in operation nearly ten months, being shut down for March, April and a part of September. The amount of ore reduced was 5,204 tons, giving an average assay of $231.50 per ton, and producing $1,128,909.91 in bullion.

The improvements made on the property, etc., amount to $62,882.91.

The Austin City Railroad has hitherto delivered all wood, timbers, lagging, etc., at the mill, which is the terminus of that road. The cost of hauling from this point to the several mines was a very heavy item of expense, and it was determined to economise in this department by building an extension of the above named road to the mines. This was accomplished at an expense of $11,735.78, and now all fuel and mining supplies are delivered where wanted without breaking bulk. This effects a great saving, which will, in a short time, pay the cost of the road.

In order to complete the railroad system, a tramway was built from the Frost to the Lander shaft. This is 1,000 feet in length, with all necessary switches and side-tracks, surmounting in that distance a perpendicular height of 277 feet. It is operated by a steam donkey-engine, situated at the Lander shaft. The cost of this plant was $3,366.46.

Until recently, nearly all the work done in Lander shaft mines has been by day's pay. The Farrell ledge, on which much work was done previously, has been worked during the entire year, yielding a large quantity of rich ore.

The Oregon ledge, below 600 foot level, is being extensively worked. The 600 incline has been sunk to the 700 level; that level extended 567 feet west, and connected with the 600 incline, and is being pushed still beyond that point. A body of high grade ore was uncovered between the 600 and 700 foot levels, a large part of which has been stoped out, but considerable ground still remains to be worked. The product of this ledge for the year was 343 tons, giving an assay value of $107,991.18. On the North Star ledge, 800-foot level, a drift was run east 331 feet, but failing to find any bodies of ore, was discontinued. There was taken from this ledge during the year 50½ tons of ore; assay value $17,704.09.

The work performed in these (Lander shaft mines), including tribune work, consists of 87,275 square feet of stopes, or breasts, 2,996 linear feet of drifts, 1,658 feet of crosscuts, 885 feet of inclines and 323 feet of chutes.

The total product was 2,287½ tons of ore, assaying $262.72 per ton, and giving in bullion $561,034.98.

Most of the work done in the Paxton incline mines on company account was below the 1,500-foot level. The 1580 and 1680 levels were run east 147 and 437 feet respectively, and connected with the Lander workings. The greatest portion of this ground was stoped out, and leasers are now breasting out the remainder.

On the 15,000 level a cross-cut has been run south 315 feet, cutting the Alabama ledge at 100 feet. This crosscut will be continued until it reaches the Oregon ledge, which it will do at a point several hundred feet west of our present workings on the 700 of the Lander, and open a considerable quantity of ground which has never been prospected. The work in these mines (Paxton incline), including tribute work for the year, consists of 64,550 square feet of stopes, 3,044 linear feet of drifts, 485 feet of crosscuts and 259 feet of incline. The product was 1,151¾ tons, assaying $203,445.85 in bullion.

The machinery at the Frost pump and compressor shaft has hitherto been used only for compressing air to supply all the mines, but during the last summer heavy 10-inch Cornish pumps were added, doing away with the use of the steam pumps which were used at the North Star pump shaft. This has effected a great improvement, as these pumps handle the water from all the mines with ease and at less expense for labor and fuel.

The Ruby incline mines were worked entirely upon the tribute system. Much new ground was opened, with, in some instances, very good results. There yet remains a large amount of unprospected ground accessible to tributers. The work for the year was the extraction of 12,300 square feet of stopes, 1,078 feet of drifts, and the product 165½ tons of ore, assaying $341.56 per ton, and yielding $53,541.57 in bullion.

The Isabella incline mines, like the Ruby mines, were worked entirely by tributers. The work accomplished was 9,450 feet of stopes, 1,336 feet of drifts, and the product 129 tons; assay, $287.68; bullion, $34,852.14.

Low-Grade Ores.

The system adopted in the latter part of 1882 for working these ores has been continued since, with gratifying success, and is found to be the source of a reasonable profit, as well as bringing in for reduction a large amount of ores that were previously thrown away, and enabling us to run the mill more regularly. Of these ores there was worked during the year 667 tons, assaying $61.61 per ton, and yielding in bullion $39,050.63.

The custom ores are, as the name implies, ores purchased from outside districts, and from mines in this vicinity in which the company has no interest. They amount for the year to 471 tons, assaying $270.60 per ton, and giving a bullion value of $120,600.29.

Low Grade Ores.

A tour among the chloride delvers in Calico District cannot but impress one with the enormous waste of mineral now being committed. Every where in the sorting, anything which the miner thinks will not work $40 per ton or over is thrown upon the pile. He tells you that it does not pay him to ship ores of lesser grade, that the cost of shipping and milling eats up the product. Again there are immense ore deposits in the district in which no higher grade ores have been found, and are therefore left to bide a change in affairs. But the actual waste going on is so serious as to demand the immediate attention of mill men and capitalists. In its arrest there are sure fortunes to be made.

In Colorado, the Black hills and elsewhere are worked mines and ores which average much less that $20 per ton with profit to both miners and mill.

Some years ago it was established in a suit in Silver City, N. M., that the cost of milling the chloride ores of that district was less that $10 per ton under a guaranty of 90 per cent yield of the assay value. The cost of fuel and labor then and there was quite as great as it is here now. Since that time the improvements made by science and experience are such as to greatly reduce the cost of milling ores of every kind. To-day the Oriental mill is reducing the low grade ores of the King mine, together with the high grade at profit.

It is capable of demonstration that a complete mill with all the modern appliances, economically handled, can reduce at least the free milling ores of this region, at a cost much less than $10 per ton, and can make large interest on the capital required to be invested, while at the same time leaving the miners enough to pay them high wages.

In this connection it should be considered that here as everywhere else, the number of mines that yield any considerable quantity of very high grade ores is small compared with those which yield large quantities of low grade. In fact it is noticeable in every silver district in the United States that most of the "rich strikes" made on the surface and published in the papers are soon "lost to sight," and become generally "to memory dear" either to the finders or too credulous purchasers. There is not one such find in 500 as the King Mine of Arizona, which carries pure metal to great depth. Capitalists have therefore become chary of interesting in claims showing merely a rich surface streak from which the miner plucks a specimen and carries it in his pocket for exhibition with the vain endeavor of "placing" his claim until the pockets of his last overalls are worn out. There must he somethiug more in sight to lure investment.

We insist, that what Calico District wants more than anything else is cheap milling and cheap transportation, and saving of the countless tons in sight of low grade ores running from $20 to $50 per ton. "There's millions in it."—*Calico Print.*

MECHANICAL PROGRESS.

Scraping Surfaces to Fit.

There is no planer that planes planes. The best it can do is make a series of minute corrugations nearly parallel and nearly level. When a job of iron work comes from a planer, its planed surface is a series of longitudinal ridges traversed by cross chatter marks. Except in degree this description applies to all work done on the planer, whether the tool used was a roughing tool with rank feed or a finish tool with fine feed. Two planed pieces of cast iron laid face to face would present surfaces of contact very much like the plowed fields of clay soil, except in a less degree.

The first preparatory work to the scraping of surfaces to fit is testing with the straight-edge, both longitudinally and across, to determine if the surface is out of wind. Inequalities are coarsely reduced by a float or mill file and afterward with a finish file, the straight-edge being the guide. The finish file must be used with great care, for it is not its office to remove all the marks of the coarser file, or even to obliterate those of the planer tool; for both may present surfaces looser in texture than untouched portions, and thus be too quickly and unevenly cut away. All this preparatory work is to be done under the guidance of the straight-edge—the surface plate has no part in it; the straight-edge determines the lines of level, the truth of the surface, while the surface plate shows the quality of the surface.

A wash of spirits of turpentine put on with a rag is better than red lead to show surface. Soon as this is put on, place the surface plate on the surface of the filed work, and rub it back and forth. This will show the condition of the surface, which will be in blotches and dots. All these bright blotches and dots should be scraped down, the finer dots and lines less proportionally than the broader blotches, and another trial with turpentine and surface plate made, to be followed again by judicious scraping. It is not expected that working surfaces are to be as perfect as those of the test straight-edges and the surface plates; the surface of the work should be even, without elevations or depressions, and should test to a straight line in all directions.

Scraping to fit is a slow, patience-demanding job, but it does not require the absolute exactness of the testing tools. Some of the tests for these are remarkable. When two surface plates, thoroughly clean, are laid together, one may be moved over the other at a mere touch, as though there was a film of ice between; the reason is that there is really a film of air between the surfaces, and it requires some force and movement to displace this air layer, when the plates will adhere so that one may be lifted by raising the other. Let one straight-edge be laid on another, face to face, and then move one end of the upper one transversely back and forth as though it was mounted on a pivot. After a few attempts a pivot will be found at a point about two-thirds or three-fourths of the entire length of the straight-edge from the moving hand. But if these surfaces are left in contact for awhile, they require force to separate them. A test was made of balancing a straight-edge three feet long and weighing thirteen pounds on a human hair. It was placed on another straight-edge, and the hair introduced between the two faces near the center. The upper one was moved on the hair as a roller until the proper point was reached, when it remained balanced perfectly, so that light could be plainly seen the entire length of the straight-edge between the two surfaces, except where the hair separated them at the middle of their length.—*Scientific American.*

Telegraph Wire.

Many experiments have been made, and no little money expended, in the endeavor to find the most economical and serviceable wire for telegraph purposes. Copper, iron and steel have been tried with varied success. Wires of compound and combined metals have been tried. The conditions sought after are the greatest conductivity with the greatest tensile strength and resistance to operation. Cheapness is also a very important consideration. Some very important experiments have recently been made in Europe with a new composition, known as silicious bronze, to which allusion is made below:

Quite recently, according to *Engineering*, at the request of the Eastern of France Railway Company, M. Lazare Weiller has developed a new type of telegraph wire, possessing less conductivity than the former, but having considerably higher tensile strength, which allows the wire to be more tightly strained, while the posts may be placed at greater distances apart. This new wire has a conductivity of 80 per cent and a tensile strength varying from 34.09 to 36.82 tons per square inch. The physical characteristics of this wire are not given. The same party has also been experimenting with a silicious bronze wire, made more especially for telephone service, and for which tensile strength is not of so much importance. After many modifications of this wire he produced a quality which gave a conductivity of 42 per cent, and tensile strength of 52.06 tons per square inch. He now also manufactures a special type for wide spans, with a conductivity of 21 per cent, and a tensile of 69.84 to 85.70 tons per square inch. The extended use of silicious bronze for telegraph and telephone systems affords further experience as to its behavior in practice, especially as to the manner in which it resists the effects of wind and snow. The Consolidated Telephone Company have several systems, in all of which silicious bronze is wholly used, one of which has especially been subjected to the test of wind during the frequent and violent storms, which usually levy tribute in the shape of uprooted posts and broken wires. In one case this wire, with a span of over 1,000 feet, withstood a most violent storm, blowing directly across it. Its power of melting snow has also been proven to be very superior. In Vienna, telephone posts are frequently placed at 1,000 feet distance apart, and carry as many as 78 parallel wires. These wires are of silicious bronze. These important advantages explain clearly the reason of the rapid extension in the use of silicious bronze as conductors for telegraph and telephone systems in Europe.

PROGRESS IN SHIP BUILDING.—When the ship Britannia was built, 45 years ago, it was looked upon as a marvel of size and power. It measured 1,155 tons, was 207 feet long, and 850-horse power engines, carried 220 tons of cargo, 120 passengers, and ran 8½ knots an hour. The new Cunarder, the Etruria, measures 8,000 tons, is of great length, has 14,000 horse power engines, carries 5,000 tons of cargo, and 1,500 passengers, and runs 19 knots an hour. The writer well recollects, when about 55 years ago, a 1,000 ton ship was built in Maine for a cotton carrier, and sent in ballast to Charleston, S. C., for a cargo; her arrival there was considered a most remarkable event. While there she was visited by thousands of people, and was looked upon as a wonderful achievement of ship-building enterprise. The famous Liverpool packets, which 50 years ago supplied all the facilities for passenger traffic between New York and Liverpool, were generally from 350 to 450 tons measurement, and were then the finest specimens of mercantile naval architecture afloat.

THE BLAST PRESSURE IN THE BESSEMER STEEL PROCESS.—In converting the steel by the Bessemer steel process, the pressure of blast used, generally runs from fourteen to twenty pounds per square inch. Few works have engines of capacity and power sufficient to maintain a pressure of over twenty-five pounds while blowing a heat. On January 23d, however, while blowing a heat in their converting works, the Scranton Steel Company maintained with their engines a continuous blast pressure of fifty pounds to the square inch. On Thursday last, they went a step further and performed the feat of blowing a heat in each of their two converters at the same time. The heat weighed four and one-half tons each, and were blown in twelve minutes. So far as known both of these feats are without precedent at any Bessemer works elsewhere, and their performance shows the very unusual power of the company's engines.

IRON MASTS.—The general impression is that an iron mast is much heavier than one of wood of the same dimensions. In reality, however, it is lighter than wood. A 60-foot trunk of spruce or yellow pine 2 feet in diameter at the base weighs far more than the shell forming the modern iron steamship masts. The masts for the new American cruiser *Atlanta*, for instance, will be fine specimens of their kind. The mainmast is 2 feet in diameter at the base, tapering to 17 inches at the top, at which point the funnel will be fashioned square; its length being 68 feet 4½ inches, the foremast being two inches shorter. The method of construction is peculiar. Three T-shaped rods of steel the length of the mast to be made are affixed base outward in circular wooden frames, and around the skeleton thus formed, the ready shaped plates are riveted in place. The plates are 12 feet in length, and about ⅜ inch in thickness.

A PREDICTION.—Mr. Edison has achieved so many triumphs as an electrician, that the public will be disposed to believe him when he says: Electricity as a motive power will not be confined to household or factory purposes. It has already been successfully used (for experimental purposes) at Berlin, Paris, Portrush (Ireland), and by the writer at Menlo Park as a motive power on a railroad. These various experiments have proven the practicability of the electric locomotive, and indicate that it will be largely adopted in the future in place of the steam locomotive.

SEVERAL SMALL VS. A SINGLE LARGE ENGINE.—It is said to be quite common in many localities, for large manufacturing establishments to substitute several small engines, each running one belt for a single large engine. Where every belt is running, the single large engine is economical; but as the number of belts is reduced, the proportional cost of the large engine rapidly increases. Besides this, if the main engine gives out, the whole establishment is brought to a standstill, while with the small engines only the shaft connected with the particular one is affected. The saving, year by year, from this plan, is said to be very large.

HYDROGEN IN IRON AND STEEL.—Brustlein concludes, from a great number of observations, that iron and steel can be alloyed with nascent hydrogen at ordinary temperatures; that at a red heat this alloy is broken up, but that at the melting temperature of steel, it may again be alloyed with hydrogen with more or less energy.

SCIENTIFIC PROGRESS.

Liquefying Air.

Science has been able to liquefy even the lightest and most mobile of gases. One of the latest accomplishments in this direction is the liquefying of atmospheric air—reducing it to a condition in which it can both be seen and felt as a liquid. This result was first accomplished at Paris in December, 1877, by Messrs. Pictet and Cailletet, two French scientists. Since that time the experiment has been many times repeated and in various places.

The pressure and degree of cold required for this interesting experiment are both very great. The exact figures are not before us, but they are much in excess of that required for liquefying carbonic acid gas, which is 5,000 pounds to the square inch and 200 degrees of temperature below the zero of the centigrade thermometer.

There is no difficulty with implements of the proper strength to reach the pressure required, but to obtain the necessarily low temperature considerable skill and thought was necessary. The method employed is described as follows: The air to be operated upon is confined in a strong tube and placed under the required pressure, and that tube in turn must be contained within another to be filled with liquefied carbonic acid gas. These conditions being obtained, the liquefied carbonic acid gas in the enclosing tube is allowed to gradually escape, which in so doing absorbs a large amount of heat from the tube charged with atmospheric air, by which the temperature of the latter is reduced to 140° below zero. But even this is not sufficient, and the remaining work is accomplished by allowing a certain portion of the air already compressed to the desired degree to also escape. This, by a further absorption of heat, lowers the temperature sufficiently to liquify a portion of the remaining air before the pressure becomes too much lessened by that escaping. Thus it is that the property which gases in the liquid state or when highly compressed, possesses of absorbing great quantities of heat when the pressure is removed from them, makes possible the liquefaction of even the most refractory, and the artificial production of temperatures which are calculated to make the polar regions blush at their warmth.

The San Diego Society of Natural History.

This society, says the San Diego *Union*, has had a prosperous and useful existence of more than ten years. It has published many interesting and some valuable papers. Its meetings have been well attended. It has fostered and encouraged a scientific spirit among our people, even outside of its membership, and has succeeded in creating for itself a respectable place among the scientific societies of the country. To-day the society is out of debt and owns a library and museum, and a building adequate to its present needs.

The San Diego Historical Society a few days ago decided to unite with the San Diego Society of Natural History, and it is probable that the consolidation will be speedily consummated. This action will widen the influence and increase the usefulness of the society.

Mr. C. R. Orcutt, a member of this society, is publishing the *West American Scientist*, the only periodical of its kind on this coast, and though only two numbers have appeared, he has already met with encouraging success.

The society needs land, and will soon need a larger building for its growing library and museum. To meet these wants a building fund has been created and a committee of five has been appointed to raise funds for the purpose.

WHAT FOSSILS TEACH.—In a recent lecture Dr. P. H. Carpenter, of Eton College, mentioned the case of Greenland as an illustration of the manner in which the earth's history is read from fossils, those remains of by-gone life which in the middle ages were regarded as "sports of nature." Fossils of four climates, all warmer than the present icy one, are found in that country. Remains of the oak and the maple tell us that the climate was once very similar to that of England to-day, and the coal, found lower down, shows that something approaching tropical heat prevailed at an earlier period. The fossils of certain sea creatures appear on the land, and that Greenland once lay beneath the sea and that its water was temperate, while the coral, obtained still lower down must have grown when the waters were still warmer.

DRY ROT.—A study of the dry rot in the twigs of fruit trees has disclosed the fact that it is caused by a contagious and transmissible disease, in which, as in the dry necrosis of leprosy in man, the cells of the affected tissues suffer a degeneration into minute bacteria, whose germs are afterward disseminated by the rupture of the cell membrane. One diseased tree is capable of infecting a whole nursery. The old and young are alike liable to the ravages of the parasitic organism.

LUMINOUS PAINT AND EARTHQUAKES.—In the Philippine Islands, where earthquakes are frequent, small [illegible]allic plates, coated with luminous paint, are placed about the premises that at the first warning the inmates are quickly guided to the door, and thus to the street. In Manilla it is laid on in patches about the bedrooms and staircases, serving as guides for the door-handles and the stairs, night lights being especially dangerous. It is satisfactory to know that highly favorable testimony as to the practical value of this simple and inexpensive aid to safety has been and continues to be received from the places above named. The few critical seconds that by its aid may be most fully utilized are of the utmost importance.

DISEASE GERMS.—It requires a first-class microscope with the best accessories to find bacteria—and some dissecting scientists claim, a first-class imagination also. Bacteria are alleged to be germs of disease, and he who discovered them has been called as one of the greatest benefactors of mankind of this generation. A Philadelphia doctor now claims that he has invented a trap in which he can capture these infinitesimal germs as flies are caught in a fly-trap. This curious contrivance is the invention of Dr. W. H. Webb, of North Sixteenth street, who has upon many occasions in the dead hours of the night tested it in the streets, and has captured enough of these deadly germs to show that we breathe anything but a healthy atmosphere. He recently obtained permission from the mayor to set his trap in the gallery of a crowded hall, and the result was appalling. He declines to explain the details of his invention in advance of the publication of an article upon the subject, which he is writing for a medical journal. As soon as this appears he purposes to send specimen traps to prominent European and American scientists, so that the value of his discovery may be fully tested.

THE BIRTHPLACE OF THE MONSOON. In the plains of India at the commencement of the monsoon, storms occur in which the lightning runs like snakes all over the sky at the rate of three or four flashes in a second, and the thunder roars without a break for frequently one or two hours at a time. Yet it is very rare that any tree or animal is struck by the electric current. The explanation of this is the great depth of the stratum of heated air next the ground, which keeps the clouds at such a hight that most of the flashes pass from cloud to cloud, and very few reach the earth.

VISIBLE SPEECH.—A remarkable example of the facility with which deaf mutes may read the motions of the lips was given in public by a young lady of 17 who was entirely deaf. Her teacher stood between the gaslight and the wall, thus outlining his profile distinctly. His pupil stood behind him and read from the shadow on the wall the words that he uttered. Here we have a new illustration of the effect of special training—minute differences of form and expression of the mouth being instantly detected where the ordinary observer sees no definite change.

THE BED OF THE SEA.—Some of the researches lately made by English explorers in regard to deep-sea beds have led to the belief that there are no rough ridges, abrupt chasms nor bare rock, and that the sea bottom at great depths is not affected by currents or streams—even by those of the magnitude of the Gulf Stream—its general appearance rather resembling that of the American prairies, and it is everywhere covered by a kind of mud.

INFLUENCE OF PETROLEUM CANS ON THE COMPASS.—It is now claimed that refined petroleum in tin cases exerts an influence on the compasses of a vessel equal to the same amount of iron or steel. The masters of the German ship *J. Weisselholm* and the schooner *Maggie Dalling* have made written reports confirming the above, and in the latter case the captain claims that his vessel went ashore through an error caused by cased petroleum.

TORPEDOES AND IRONCLADS.—A series of experiments has been conducted at Spezzia, Italy, to ascertain the effects of torpedoes on a keel vessel of the type of the ironclad *Italia*. Her steel plates were displaced and bent, and the water entered her compartments, but she maintained her position. The result is regarded as showing that the effect of torpedoes is overrated, and that they are insufficient for the defense of ports.

M. NIAUDET has recently been experimenting with some success on the reduction of chloride of sodium (common salt) into its components by means of the electric current. It is to be hoped that he has discovered an economical means of separating this body into its elements, as both chlorine and metallic sodium are of very great value in the arts.

GLACIERS IN SWEDEN.—By examination and measurement during the last two years, Dr. Svenonius has found the glaciers of Sweden to number about a hundred, with a combined area of only nine Swedish square miles (about 400 English square miles). The glacial area of the country had been previously estimated to be more than three times as great.

HUXLEY AND DARWIN.—Huxley's acceptance of Darwinism is given in these words: "I adopt the theory of Darwin under the reserve that proof should be given that physiological species can be produced by selective crossing."

SAN FRANCISCO:
Saturday Morning, Feb. 14, 1885.

TABLE OF CONTENTS.

EDITORIALS.—Drilling in Cement, 105. Passing Events; Smelting Carbonate Ores; The Ironworkers' Strike; "Concentrates," 108. Dakota Tin Mines; Northwest Coast Iron Works; California Mining Appliances for Russia, 109. Mining Bill, 116.

ILLUSTRATIONS.—An Improved Carriage for Pneumatic Drills in Mining Works, 105. The Albion Iron Works, Victoria, B. C., 109.

CORRESPONDENCE.—New Mexican Mines, 106.

MECHANICAL PROGRESS.—Scraping Surfaces to Fit; Telegraph Wire; Progress in Ship Building; The Blast Pressure in the Bessemer Steel Process; Iron Masts; A Prediction; Several Small vs. a Single Large Engine; Hydrogen in Iron and Steel, 107.

SCIENTIFIC PROGRESS.—Liquefying Air; The San Diego Society of Natural History; What Fossils Teach; Dry Rot; Luminous Paint and Earthquakes; Disease Germs; The Birthplace of the Monsoon; Visible Speech; The Bed of the Sea; Influence of Petroleum Cans on the Compass; Torpedoes and Ironclads; Glaciers in Sweden; Huxley and Darwin, 107.

ENGINEERING NOTES.—Elevated Railroads said to be Unsafe; Wear and Tear of Ships; Aerial Navigation by Night; New Orleans in Danger; A New Siege Gun; Asphalt in Concrete; Steel Cars, 111.

USEFUL INFORMATION.—The Philosophy of an Open Fire; A Repeating Match; The Study of Finger Nails; Iron for Building Purposes; New Skating Surface; Copying Manuscript; Cable Roads, 111.

GOOD HEALTH.—Wanted—A Sanitary Inspector for the Villages; First Aid to the Injured; The Hair; The Brain and the Teeth, 111.

MISCELLANEOUS.—The Richmond Furnaces; Arizona as a Gold Country; The Manhattan Mine; Low Grade Ores, 106. The Nevada Silver Convention; Bodie's Yield, 110.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 112-13.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 116.

Business Announcements.

Partner Wanted—J. Pettinger, S. F.
Dividend Notice—Plymouth Con. G. M. Co.
Patent Right for Sale—Strong & Co., S. F.

Passing Events.

The local topic of interest is the strike among iron workers in the San Francisco foundries. The shops are practically closed pending negotiation between the employers and the workmen. The subject is referred to at length in another column.

The telegraph reports that miners are on a strike in the Wood River country, and resist the replacing of $4 men with $3.50 men. The cut in wages has extended to the Sawtooth country, and most of the miners at Vienna quit work on the 1st instant, refusing to take less than $4 per day. The strikers have notified miners through the press not to go to Wood River in search of work.

There is also trouble among the miners in Tuscarora, Nevada, the owners of the Navajo-Independence, desiring to cut down wages $1 per day. The employes refused to submit to a reduction of $1 per day, but expressed a willingness to accede to a cut of 50 cents. A telegram to that effect was forwarded to the management in San Francisco, but they decided if the reduction could not be obtained to close down until it could. The mill has closed down.

The Legislature has made an appropriation of $10,000 to have California properly represented at the New Orleans Exposition.

The news from the war in the Soudan has attracted great public interest this week, the death of the famous General Gordon being greatly regretted.

Smelting Carbonate Ores.

They first began successfully to smelt carbonate ores of copper in Arizona about 1873, when Messrs. Lazinski, opened the Longfellow mine, at Clifton. The ores consisted of carbonate and oxides of copper, associated with peroxide of iron and manganese. They worked with a crude Mexican furnace, then reverberatory and then put up a water-jacket furnace. It is estimated that they produced 20,000,000 pounds of copper, while they owned the mines, and this, when their nearest railroad was 700 miles distant, and coke had to be brought 80 miles. The Arizona Copper Co., a Scotch organization, now own these mines, and have an extensive plant, capable of turning out 30,000 pounds of copper a day. There are five furnaces, of the water-jacket pattern. When they were smelting in the copper, water-jacketed furnace, ore from the Longfellow, which contained rather an excess of base oxides of iron and manganese, it was found that when the charge contained an excess of manganese over iron, the slag was thick and the copper separated imperfectly; but the ferruginous slags usually made with about 50 per cent of protoxide of iron, and 10 per cent of manganese, did not contain over one per cent of copper. The ores carrying on an average only about 14 per cent silica, and the slags less than 30 per cent silica, the resulting coke copper was impure, nearly 10 per cent of iron entering it. These analyses are from the report of A. W. Wendt.

At another smelting works on the San Francisco river, the opposite error was for a time committed of running with a far too acid charge, the resulting slag from which was carried as high as 53 per cent of silica. As a consequence all the iron manganese and other valuable bases entered the slags, leaving the copper cake almost absolutely pure; but the silica had in addition to draw upon the copper, of which three per cent and over entered the slags. When charcoal was used by the Longfellow smelters the consumption was one to four and a half of ore. With three quarters coke and one-quarter charcoal the consumption of fuel dropped from one to seven. With coke, the Detroit Company is smelting over nine of charge with one of Welsh, or patent coke. These figures were compiled by Mr. James Douglas, Jr.

At the Copper Queen smelting works, at Bisbee, the production of a very pure copper cake and at the same time a tolerably clean slag has been obtained by a judicious furnace mixture. The furnace is supplied from a large body of oxidized ore in limestone. At the surface the ore consisted of crystalline masses of carbonate of copper and calcite, in which concretions of copper carbonate, calcite, oxide of iron and manganese were imbedded. As depth has been attained, crystalline carbonates have ceased to be the principal product, but they still occur in a soft argillaceous ore carrying a high percentage of copper as a carbonate and oxide. This constitutes the bulk of the deposit, and carries nearly enough silica to satisfy the lime, iron and manganese of the ore itself, which is thus almost self-fluxing when mixed in proper proportions.

The furnaces are of the well-known water jacket pattern. The furnace is fed alternately with Trinidad coke and ore, the coke being to the ore as one to six. When Cardiff coke is used its consumption is only one to seven and a half of ore. Throughout the mine traces of sulphur exist, which enter the cake, but no copper sulphide is found, nor is the lime a sulphate, as might be expected were the ore derived from a sulphide oxidized in place. The coke runs from 975 to 98 per cent. In 1882 the mine yielded 4202 tons of cake copper, equal to 4052 tons of refined ingot. In 1883, the yield was 7,950,000 pounds of copper. The statistics of this mine from the commencement of work up to March, 1884, show the following figures: Ore mined, 90,021 tons; ore milled, 89,586 tons; black cop per bullion produced, 12,050 tons; total value of product, $3,368,878; total expenses, $1,384,974; dividends, $1,225,000; average yield of ore in black copper bullion, 13 45-100 per cent; average yield of bullion when refined, 90½ per cent. They use about 6,500 tons of coke per year, 3,600 cords of wood, and employ about 180 men.

SOME prospectors claim to have discovered a tin mine in Douglas county, Or.

The Iron Workers' Strike.

For some months past business has been very dull among the foundry and machine shops in this city, and the larger foundries especially have felt the depression. Competition with Eastern-made machinery has reduced the volume of business and lowered prices, and the general prevailing dullness of trade has contributed to the depression. The proprietors of the larger shops posted placards informing the men that a reduction of 15 per cent would be made in wages, beginning on Monday last. The machinists, boiler-makers, moulders, etc., refused to accept the reduction and left the shops. The shops so far affected are the Union, Fulton, Risdon, National, Pacific and Empire. The committee of three appointed by the Moulders' Union visited the shops where the reduction notice had been posted, and informed the proprietors that the men would not go to work unless they received the old wages. Nearly all of the proprietors explained to the committee the cause of the cut, and in almost every case stated that they decided upon it reluctantly. The committee, on the other hand, stated that the reduction had been made without conference with the men, and that they had but one course to adopt, and that was to strike. Irving M. Scott suggested to the committee that the men appoint a committee of conference to meet the proprietors to adjust the matter.

Meetings have been held by the machinists, iron moulders, boiler-makers, pattern-makers and blacksmiths, to discuss the situation. They have agreed to stand by each other and hold out for the old prices. At the machinists' meeting resolutions condemning and protesting against the proposed 15 per cent reduction in wages were read and approved, and an invitation extended to all machinists and iron workers to sign the roll of the permanent organization. A rule was adopted requiring all who signed to deposit $1 as an initiation fee, the monthly dues to be 25 cents. The roll of shops was then called, the members of the various establishments coming forward and signing their names. A large number of unattached machinists also signed.

The proprietors of the Pacific Iron Works sent out an invitation to the various representatives to meet on Wednesday and discuss the matter of controversy. The meeting was held at Mr. Rankin's office at 3:30 o'clock, and lasted nearly two hours. The moulders were represented by their committee, composed of Samuel McKee, Charles Hawkins, James de Succa, H. R. Luke and Felix Gunn. The employers were represented by Ira P. Rankin and A. P. Brayton of the Pacific Iron Works, J. O. B. Gunn of the Union Iron Works, Richard Savage of the Empire, Daniel E. Hayes of the Fulton, and W. H. Taylor and Joseph Moore of the Risdon. The proceedings assumed the form of an informal conversation, no offer of compromise being made or hinted at on either side. The conversation was pleasant and entirely without acrimony.

On the part of the employers it was stated that the proposed reduction was justified by their inability compete with Eastern manufacturers at the present rates of wages. The manufacturers had found it impossible to compete with the Eastern houses for the trade of Arizona, New Mexico, Mexico, Montana and Idaho. They were frequently invited to estimate on work for those Territories, which they considered neutral ground, but, owing to the high rate of wages prevailing here, they were unable to do so, and to-day San Francisco did not get more than 10 per cent of that trade, although there was no longer any unjust discrimination in freight rates to those points in favor of Chicago and St. Louis as against San Francisco. They claimed that they had been losing money, and that the reduction was a necessity.

On the part of the men it was admitted that if these statements were true there would be no injustice in the action of the proprietors, but they did not admit that the statements made by the employers were borne out by figures. After about two hours spent in fruitless discussion, the conference adjourned without any action. It is reported that the large iron works which had time contracts on hand, under which they were liable to penalties for non-completion of the work within contract time, have secured extensions of time in anticipation of the possibility of a long suspension.

The proprietors of the shops insist upon the 15 per cent reduction in the wages of all the pattern-makers, moulders, machinists, blacksmiths and boiler-makers in their employ. The journeymen accordingly, to the number of about 1,000 or 1,500, are all out on a strike and the shops are comparatively vacant, containing only a few apprentices and the foremen. For a time it was believed that a compromise could be effected by the employers limiting the reduction to 10 instead of 15 per cent, but these terms are not acceptable to a majority of the men, who declare that they will resist to the last any attempt of the "bosses" to lower wages. The Iron Moulders' Union is a branch of the National Iron Moulders' Union of Cincinnati, that claims a membership of from 15,000 to 20,000. The status of the strike has been telegraphed to the National Union, and the men are sanguine of receiving substantial pecuniary aid from their brethren in the East should the struggle between the employes and the employers be continued for any considerable length of time. The proprietors, on the other hand, feel that as business is exceedingly dull, they can afford to close the shops for a time if necessary. Efforts are being made for a compromise, but at this writing no conclusion has been reached. A few boys are working at some of the shops, but most of them are closed down.

"Concentrates."

[Written for Press by "F. W. S."]

IF you want a mine, develop your prospect.

NEVER build a mill till you've got an ore producing mine.

STICK to one claim and develop it systematically.

SUBSCRIBE at once for your local paper. In addition to this take a journal that is devoted exclusively to mines and mining, as such a paper keeps you posted on mining laws, new and successful methods, and through its columns the attention of capital is attracted toward your camp and your mine.

IF a stranger visits your camp looking for investment, don't frighten capital away by asking a dozen prices for a good-looking prospect hole. Always remember a prospect is not a mine.

MINES are not found—they are made, by thoroughly developing a prospect.

THERE are too many men with more sand than sense superintending and working mines now-a-days. There are exceptions, of course. Some seek in Colorado that which only exists in California, and *vice versa*.

MEN thoroughly conversant with the formations and ores of a district are the best to superintend a mine.

ALWAYS arrange your selections of ledge and vein matter for assays; don't pick out the rich and leave the poor. Further investigation will reflect bad on yourself and the entire district.

DO not misrepresent a mine; it not only hurts yourself, but the camp as well.

ENCOURAGE and assist legitimate mining. Do not appoint a bank clerk or store-keeper as a superintendent of a mine or mill.

MINING SUPERINTENDENTS do much to help or kill a camp. A practical man in charge of a property should be encouraged.

TRY and post yourself on the formations of your district. Do not work on the "by guess and by gosh" system.

GO DOWN deep on a vein before starting a long tunnel to tap it. Be sure that the ore is of such grade and quantity as to justify you in taking chances on a long tunnel through hard rock.

TAKE a pick handle to all cranks who come around with "whang doodles," "indicators," and such spiritualistic rackets.

SIT down on all booms. If big strikes are made and paying mines opened, there will be no trouble to dispose of them all to men of wealth. Money will develop the camp and its inhabitants; not the rabble who follow a boom will reap the benefits.

Dakota Tin Mines.

For many years search has been made by prospectors to find paying mines of tin in the United States. A deposit of tin was found in San Bernardino county, in California, but for some reasons, though a little tin was produced, the mines have never been worked in a manner to put their product on the market. There has been a sort of mythical idea that the Government would give a reward for the discovery of tin mines, but our Government does not offer such aids to any industry. When a man finds a mine of any kind he can take possession of it, and for a nominal sum patent and get a Government title to the property.

Tin has finally been discovered, however, in Dakota, and in quantities that promise to make the mines there very valuable. Through the kindness of Mr. Mark R. Hydliff, of Bear Gulch, D. T., we have received a box of specimens of ore and a small block of the tin, which may be examined by the curious at our editorial rooms.

The little bar of tin is from Nigger Hill, where the mines are located. There is also a small bar of stream tin, similar to that found in Cornwall. There are also specimens of ore from the following claims: Swansea, Ohio, Crow Dog, Grace, Commercial, Rough and Ready, Boston, Grant, Michigan, Morning Star and Dakota. The samples are much alike, and are all distinguished by carrying considerable mica. Mr. Hydliff sends us a description of the mines, which is as follows:

The Bear Gulch section of country lies in the northwestern corner of the Black Hills, about eighteen miles west of Deadwood, D. T., and about ninety-five miles north of the south line of Dakota, and is composed of four mining districts—Iron Creek district, Potato Creek district, Rawlins district and Hurricane district, the latter being in Wyoming Territory and adjoining Rawlins district on the west, and separated by the Territorial line. This section of country from the time of the discovery of gold in the placers, for a few years was one of the best producers of gold in the Black Hills, but the mines, which had the advantage of plenty of water, were worked out, cutting the production down. But a new source of wealth is looming up in the tin, and tin mines of Nigger Hill and vicinity. In washing the gravel of the placers for gold, a very heavy, dark-colored mineral was encountered, which the miners called "iron-rock" or "black sand," but a little over a year ago was discovered to be stream tin ore, cassiterite or black oxide of tin, and carrying from 60 to 75 per cent of pure tin. There are about fifty miles of gulches in this section, which will produce an immense amount of stream tin ore when worked with a proper system for saving the ore. Until the spring of 1884, the stream tin was considered a nuisance, and cast away with the tailings, but when the season opened, the miners in working for gold, out of curiosity, saved what tin they could conveniently with the common sluices and riffles, and made so as to get rid of the tin as much as possible, and about four tons of the ore was collected and shipped, two tons going to England and the balance going to different points of the United States, all to be tested and experimented with; and all returns give a remarkably pure oxide of tin.

On the discovery of

Stream Tin in the Gulches,

Prospectors were induced to search for the source, and it was soon found in the immense granite ledges that are plainly traceable through the country. The ledges are true fissure veins, from two feet to three hundred feet in width, with slates and porphyry for wall rock. The granite is composed of very coarse crystals of quartz, feldspar and mica, and carries the tin ore in fine particles, invisible to the eye, disseminated through the rock, also in coarse cubes and crystals, and quite free from base minerals, and assaying as well, if not a little better, than the stream tin. The tin ledges also yield an average assay of about $8 per ton in gold and good trace of silver, and with proper reduction and concentrating works, the tin and precious metals can be readily saved, as the rock is free milling, and tin ore does not interfere with amalgamation. The area of the belt is about 6x8 miles, partly in Wyoming and surrounded by lime and sandstone. The prominent tin mines and those which show up the best for the small amount of development are those of the several groups situated on the divide between Bear and Sand creeks, of the Nigger Hill group situated on the summit of the divide.

The Rough and Ready is developed by an open cut, exposing the ledge for 50 feet across the vein, showing good tin ore and assaying eight dollars per ton in gold and good trace of silver.

The Mines.

The Giant has a tunnel 300 feet and shaft 60 feet, showing good veins of tin ore, and carries milling prospect in gold. Morning Star has a shaft down about 10 feet in a fine body of tin ore. The Michigan is developed by a tunnel 65 feet in ore, improving on depth, with porphyry hanging and footwall. The Ohio, the north extension of the Michigan, has a good body of ore with porphyry hanging and footwall. West of the Ohio is the Indiana, and east of the Ohio, the November, both promising locations. On the eastern slope of the divide, towards Bear Gulch, are the Modoc, with slate walls and fine tin croppings: Crow Dog, with shaft 35 feet deep, slate walls, and assaying two and a quarter per cent of tin ore, $7.60 in gold and $1.60 in silver per ton. The Sontag ledge is eight to nine feet in width, with slate walls and showing the same characteristics as the other locations.

Steptoe is looking well and has a slate footwall with porphyry hanging wall.

The Spearfish is developed with open cut and is a very wide ledge with porphyry hanging wall and slate footwall. It also carries good prospects of gold and silver.

The Mono and Soho are each developed by by two shafts and show tin in each of the shafts, the walls being slate. Between Mace and Wyoming gulches is the Swansea consisting of four locations. The Swansea No. 1 is opened by a shaft 12 feet deep, carries tin and gold, and has slate walls running into porphyry. Swansea No. 2 has two shafts 14 feet deep, trap rock hanging-wall, carries tin and gold—about five per cent of tin. Swansea No. 3 has a shaft 25 feet deep; vein three feet wide; slate walls, and carries gold and tin. Swansea No. 4 has a shaft 12 feet deep, with slate walls, and carries gold and tin. Northerly on the same vein is the Boston group, embracing five locations.

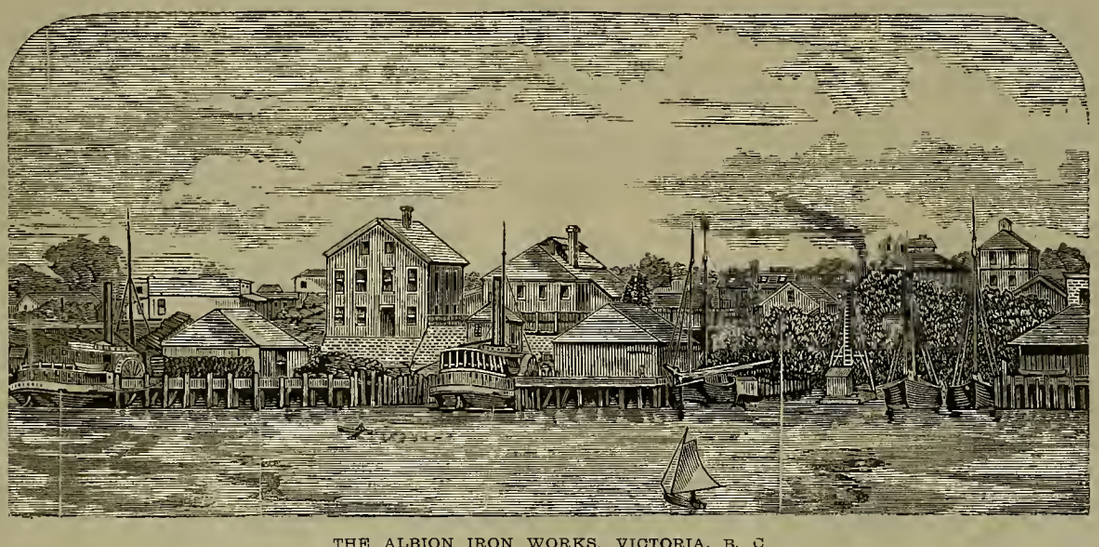
The Boston is opened by a shaft 25 feet, with slate walls and carrying a fair average of from four to five per cent of tin ore to the mass. The Commercial, another fine vein, also carrying from four to five per cent of ore has slate walls, and is opened by a shaft 25 feet. The New York, Atlantic and Pacific are three promising locations of the same group.

The Grace is a promising tin mine with a large body of tin ore, and good prospects of gold ore obtained by pulverizing and washing with the pan. There are also hundreds of other locations with but little or no work upon them, which might prove good properties should pains be taken to explore them. The locations mentioned are thought to be fine prospects by all experienced experts who have visited this section of country.

Northwest Coast Iron Works.

On this coast, notwithstanding our abundant mineral resources, in one respect we are somewhat lacking, and that is in the matter of iron. In California there is only one deposit of iron being worked. In Oregon and Washington, and in British Columbia some iron ore is being worked also, the Oswego works of Oregon shipping some pig iron to this port. Within the past two years, however, our northern neighbors have been looking up their iron interests, and in addition to opening a few mines, several iron working establishments are now at work. That of the Albion Iron Works at Victoria, B. C., is one of the oldest and best equipped on the coast north of this city.

These works occupy about three acres of space.



THE ALBION IRON WORKS, VICTORIA, B. C.

They front directly upon the harbor, and have extensive wharves and commodious store-houses. The machine shop is 250x50, two stories, and fitted with machinery of the most approved kind.

The company manufactures steam engines of every description, fish-canning machinery, etc., and can complete the largest work required. In the pattern room all the patterns required for the works are made. The brass finishing shop contains all necessary machinery. The blacksmith shop, boiler house and foundry are also completely supplied. In the stove foundry are turned out more than 30 different kinds of stoves, for kitchen, parlor, hall and other purposes. About 100 skilled mechanics are employed.

These works have supplied the iron for bridges on the North Pacific Railway west of the Rockies, and are now under contract to supply all the iron work necessary to complete or equip the British Columbian section of the Canada Pacific Railway. The works have recently completed two pair of powerful hoisting engines with drums 96 inches in diameter for the Wellington Colliery. The stove department has become quite an important part of the business, turning out 40 stoves per day.

FILTERING APPARATUS.—Trials are being made this week on the upper floor of 23 Stevenson street, of the filtering apparatus of Juan Macay. This appliance is intended for use in the solving process of working ores, by which the filtering may be hastened and better results attained. On the completion of the tests we shall publish the results together with a description of the machine. Persons interested in machinery of this character may see the apparatus at the address given.

California Mining Appliances for Russia

Mr. Michael Shostak, a mining engineer who was sent by the Russian Government to Australia and to this country to examine the methods of gold mining, has completed his investigation, and this week returned, by way of New York, to St. Petersburg to make his report. He spent several months both in Australia and in California. While here he visited the centers of the gold mining industry, examining the quartz mill machinery, and the appliances used in hydraulic, drift, cement and placer mining. In a conversation with him a few days since, he expressed himself as much pleased with what he saw here, and stated his determination of ordering from California a number of the mechanical appliances which he saw at work.

In some few things he thinks the Russians are ahead of us. He thinks their puddling machine for washing gold gravel is superior to anything we have where there is not enough water to hydraulic. He is of the opinion that it could be successfully applied in our drift mines. Mr. Shostak has promised to send us a detailed description with drawings of the best Russian puddlers, when he arrives home.

He was much pleased with the plant he saw at the Spring Valley gravel mine, and the mills in Nevada county. He was not very favorably impressed with our hydraulic mining system, on account of the percentage of loss, though he recognized, of course, what enormous quantities of material could be removed. But in his country the government enforces a rule that certain percentages must be saved or the mines are taken from those working them, after fines for the first offence. One appliance he saw here he says will be of great benefit to Russian gold miners, and that is the Cranston gravel elevator. He will order a number of these. The Pelton water-wheel he will also introduce. He says that in Russia they use elevators and endless belts for handling their gravel to great advantage, and saw several places here where they could be used beneficially and dispense with horses and men. In his report to the Russian Government, Mr. Shostak will describe in detail all the appliances he saw here, and he is convinced that many of them can be introduced in Russia to the benefit of their mines. He has ordered copies of the MINING AND SCIENTIFIC PRESS to be forwarded hereafter to the Mining Department of the Russian Government, in order that they may see what improvements are being made in the methods and appliances of gold mining.

ORE STEALING.—A dispatch from Dagget, San Bernardino county, dated the 11th, says: Owing to claim jumping and ore thieves, William Raymond and J. S. Doe, owners of the Garfield and Odessa group of mines, have closed down, throwing over 100 miners out of work. Thieves have been carrying off ore by the sack for 80 days, using the shot-gun to protect their thievish operations. The country is full of tramp miners. They are carrying a high hand on all sides. James L. Patterson, superintendent of the Garfield, has resigned and is about to leave the country, owing to the numerous threats to take his life. Sheriff LeCyr is keeping the shooters quiet, but they are liable to break out at any hour. The jumpers and ore thieves of the Nellie Gray are in jail in San Bernardino, being unable to give bonds.

THE DIVIDEND this month of the Plymouth Consolidated mine, Amador Co., Cal., is the twenty-first consecutive monthly dividend of $50,000, or $1,050,000 in all.

THE Massachusetts Legislature has refused to allow a woman preacher of Nantucket to perform the marriage ceremony.

The Nevada Silver Convention.

In last week's PRESS the resolutions adopted by the Denver Silver Convention were given, and mention was also made of the Nevada Silver Convention which met at Carson. The committee on credentials found the following entitled to seats in the convention:

Eureka County.—E. Robert (M. D. Foley, proxy); H. Johnson (M. D. Foley, proxy); R. K. Morrison (M. D. Foley, proxy); J. C. Powell (M. D. Foley, Proxy); R. Sadler, F. Rohhius, Alex. Fraser (D. E. Bailey, proxy); W. Arrington (D. E. Bailey, proxy); Henry Rieves, S. J. Beehee, George Mullins (W. J. Penrose, proxy).

Churchill.—Charles Kaiser, W. H. A. Pike, L. Alleu (W. Marsden, proxy); W. W. Williams (J. W. Furgerson, proxy); C. S. Kellogg (C. Kaiscr, proxy).

Ormsby.—D. A. Bender, Robert Logan, A. C. Ellis, T. D. Edwards, George H. Morrison, Evan Williams.

Esmeralda.—W. M. Seawell, J. M. Jones, A. B. Turner, T. H. Wells, A. Farriugton.

Nye.—N. S. Trowbridge, George Ernst, R. C. Langworthy, George E. Clark, Patrick Downey (A. Maute, proxy); T. J. Bell.

Washoc.—Jerry Schooling, R. L. Fulton, C. C. Powning, B. F. Leete, H. H. Beck, J. H. Whited, A. H. Barnes, W. N. Knox, C. S. Prehlc.

C. Harlow, William Garrard, Robert Harper, Wells Drury, S. P. Davis, M. D. Noteware, Otto Greenhood and all members of the Senate and Assembly.

A number of gentlemen spoke concerning the silver question. Among them Col. H. G. Shaw, editor of the *Virginia Enterprise*, Hon. Wm. Woodburn. Senator Briggs, Mr. Ernst, Geo. Morrison, of Ormsby, Mr. Dovey, Chas. F. Becknell, Mr. Fulton, of Reno, Mr. Bell, of Nye and others. A committee was appointed to embody the views of the convention in writing and the committee reported the following resolutions:

WHEREAS, The agitation in financial circles against the continued coinage of silver in the United States has assumed so serious an aspect as to menace not only the silver mining industry of the country, but to depreciate the prices of all agricultural products, to greatly increase the burdens of the debtor class and to greatly lower the wages of every class of labor; therefore, we, the people of Nevada, in convention assembled at Carson City, January 31, 1885, do hereby declare as our deliberately-formed conviction, that the said agitation is based upon glittering fallacies, false premises, perverted figures and distorted facts. As evidence of the justice of our position, we submit the following self-evident propositions, to the truth of which we challenge successful contradiction:

First—That while the United States of America includes only four per cent of the population of the globe, it annually produces one-third of the gold and one-half of the silver product of the civilized world.

Second—That to paralyze the silver industry in the United States is to rob the world of one-ninth of its total gold product, that being the proportion of the world's gold crop harvested from American silver.

Third—That owing to the hostile legislation, both in Europe and the United States, against silver as a monetary metal, its natural function as a medium of exchange has been greatly though not irretrievably impaired, and its twin metal, gold, correspondingly inflated, thus diminishing the volume of the entire specie for the business of the world.

Fourth—That Great Britain, while sustaining the single gold standard at home, is one of the principal silver-using nations of the world, and is interested in depreciating the bullion value thereof in order to facilitate her vast commerce with her Indian possessions. With cheap silver in the London market she is enabled to buy wheat in Calcutta at a lower rate than she can import breadstuffs from the United States. With the American government co-operating in the pernicious work of depreciating silver, our surplus bullion seeks the London market and becomes, in the hands of foreign capitalists, a weapon to annihilate American agriculture. Thus are our own products turned upon us to degrade and cheapen American labor.

Fifth—The annual addition to the stock of silver and gold in existence is proportionally smaller than the annual increase of population, wealth and exchange.

Sixth—The ratio of the production of silver to the production of gold continues practically unchanged; therefore, be it

Resolved, That this Convention heartily indorses the resolutions of the late Silver Convention held at Denver, Col., and is as follows:

The States and Territories of Kansas, Colorado, Utah, New Mexico, Idaho, Wyoming and Arizona, in Convention assembled, adopt the following resolutions as a declaration of principles:

First—That we are in favor of the doctrine of bimetalism as embodied in the laws of the United States previous to 1873, and we urge the enactment of those laws at the earliest possible moment.

Second—That, in the interest of trade and commerce, we demand free and unlimited coinage of gold and silver bullion at the present standard of coinage.

Third—We demand that Congress shall pass an Act directing the Secretary of the Treasury to withdraw from circulation all one and two dollar bills, in order to give a larger circulation to standard dollars.

Fourth—We condemn the Secretaries of the Treasury for their unlawful evasions of the provisions of the Bland bill, and demand that clearing-house balances and obligations of the Government be paid without discrimination in gold and silver, or gold and silver certificates.

Fifth—Resolved, That it is the sense of this convention that a law amendatory of the National Bank Act be enacted whereby said banks throughout the United States shall keep not less than fifteen per cent of legal reserves in national silver coin, and also that the redemption fund of said banks shall be in silver coin.

Sixth—That until Congress shall restore silver to its ancient, rightful and constitutional equality with gold in respect to coinage, we demand a liberal construction and faithful execution of the provisions of the Bland bill.

Seventh—That the demands and recommendations about to be made are based on broader grounds than any consideration of mere sectionalism or protection of a particular industry; that they are the well-nigh forgotten terms of the wise Constitution and laws under which this nation has gained its place as the foremost people of the globe; that silver needed no such protection as is extended to the pampered industries of the East; that this question is touching the interests of every human being in this broad land, and that it involves the question of whether the debt-paying medium of the nation shall be so changed as to increase the value of notes, bonds, mortgages and other fixed incomes, and depreciate the value of all other property, and also involve the proper execution of our Constitution and our laws.

H. C. Snyder, of Kansas, offered the following, which was adopted:

WHEREAS, The material and commercial interests of the southern and western portions of this nation are of great importance to the prosperity of the whole nation; and,

WHEREAS, The Secretary of the Treasury sways the financial power of the Administration, and has seemed to possess the power to almost nullify Acts of Congress, as is notably instanced in the manner in which the Treasury has been administered since the passage of the Act known as the Bland Silver bill; therefore,

Resolved, That the Silver Convention, composed of delegates from the several States and Territories, of all political opinions and complexions, earnestly request President-elect Grover Cleveland to select some statesman for Secretary of the Treasury who will not labor in the interest of national banks and Eastern brokers, but will recognize the great interests of the South and West in shaping the financial policy of the Administration and strive to promote the interests of the whole people, instead of consulting the wishes of the magnates of Wall street.

Resolved, That the suggestions of the Secretary of the Treasury in his late annual report to the President, that the accumulation of standard dollars in the vaults of the Treasury of the United States has resulted in great inconvenience to that Department, and that because of such fact the further coinage of silver should cease, are not worthy to be considered in connection with the prosperity of the people engaged in the production of silver, nor in connection with the proper solution of the question of the currency of the Republic; but to meet such alleged inconvenience and to promote and maintain the prosperity of the thousands who have embarked their all in the production of the precious metals in our country, upon the faith of past legislation, this convention declares that it is in favor of the enactment of such laws as will authorize and require the issuance of silver certificates for all domestic silver bullion of the required fineness, which may be deposited at the United States Mints after the same shall have been parted and refined and the value thereof stamped by the Government upon such bullion, such value to be expressed in standard dollars of the weight of 412½ grains, as now required by law, and such bullion value to be estimated and determined at the ratio of $129.29 per ounce of fine silver. Such bullion to be kept by the Government on deposit for the redemption of such silver certificates, which shall be a legal tender for all debts, public and private. That it is to the interest of trade, commerce and the permanent credit of the United States that the paper currency of this nation should be represented by its equivalent in gold and silver in the United States Treasury at a date as early as practicable.

Resolved, That we believe that the recoinage of the subsidiary silver coin, so that it shall carry the same proportion of silver as is contained in the standard dollar, would result in the purification of our silver coinage and in the advantageous use of much of our unemployed silver.

After recording the foregoing resolutions, each one of which elicited loud applause, Colonel Ellis delivered a graceful and eloquent address, during which he recited with much vividness the various aspects of the war against silver.

A motion by Lieutenant Governor Laughton was carried, urging the immediate organization of a permanent association and the reference to it of other matters of the work of preparing a memorial to be submitted to Congress.

The Committee on Resolutions reported without recommendation two resolutions offered by Mr. McMillan, of Humboldt. One was urging the Legislature to re-establish the office of State Mineralogist, who shall be a graduate of some reputable school of mines or metallurgical college; also recommending that a mineral reduction works be established in connection with the University for the accurate and successful treatment of ores in quautities of one ton and upwards, which reduction works shall be under the management of the State Mineralogist, who shall hold his office four years, and that in connection with said reduction works a mining bureau be established for the dissemination of data connected with the reduction of silver. The second resolution was as follows:

That our representatives in Congress be requested to use their influence to have created a committee to revise the existing mining laws of the United States, and, if possible, so revise these laws that hereafter a person's title to a mining claim of any kind shall consist in actually using and in the continuous working of said claim, that when said work has not been done for a period of sixty days such claim shall be considered abandoned.

Both these resolutions were referred to the permanent organization.

Mr. Dennis offered the following resolution, which, after considerable debate, was referred to the permanent organization:

Resolved, That this convention favors such modification of the bullion tax law in this State as will reduce the tax burden uniformly and equitably upon all classes of ores, thereby affording equal relief to the mining industry in all parts of the State.

Bodie's Yield.

Statistics Covering a Period of Eight Years.

The Bodie *Free Press* gave a brief report of the bullion shipment as shown by Wells, Fargo and Co.'s books, but owing to portions of shipments that were recorded in previous tables on the last of December and in the express books on the 1st of the new year, the output for the past year does not foot up quite so heavy. The grand total, however, is the same. The *Free Press* says: We take pleasure in again presenting a showing that will be a surprise to many who predicted that the bottom had been knocked out of the district. It is our candid opinion that new developments will bring the camp to the front for eight years more of prosperity; that in the past season we have experienced the worst. Even should all else fail, we have a low-grade proposition that must eventually make bright the many homes of those who are not here merely for their health.

Standard Consolidated.

On the 19th of last March 15 stamps that were employed on Standard ore at the Bulwer-Standard mill closed down, and on the 2d of May the "Old Reliable," the Standard mill, was silenced for the first time since its erection. About the 5th, 15 stamps were again employed at the first named mill and the remaining 15 stamps were run on Bodie Consolidated ore. The 30 stamps continued crushing ore from the two mines till about the 10th of July; then the Standard Consolidated ran the entire mill, using one-half (15 stamps) for working tailings until December 5th. Owing to the frost, the working of tailings was discontinued, but 15 stamps continued crushing ore until about December 15th, after which the mill was closed down. On the 16th of the new year, present month, it resumed again, working 15 stamps on ore. The pumping machinery of this mine was stopped when further prospecting on the lower levels ceased, consequently at the present time there is about 300 feet of water, from the 900 to the 1200-foot levels. Although it has proved a dull season for the Standard and brought about the first assessment, yet it is folly to presume that the bottom is knocked out. Its record of disbursing four and one-half millions of dollars among its shareholders ought to be a sufficient guarantee that the mine will be kept in order and further developments prosecuted as long as the present low-grade ore (of which there is a large quantity) continues to pay the hulk of the expenses. Should cheaper facilities for milling be in any way devised, there cannot be any doubt but that the mine will continue work for as many more years, with the chance of striking new developments at any time. Worked as cheap as the Syndicate, the low-grade ore now in sight would probably more than pay expenses.

OUTPUT OF STANDARD CON. MINE IN 1884.

Total	$9,936,507.29

The Syndicate.

The Syndicate mine bids fair to prove the old reliable in every sense of the word. Although working for years upon low-grade ore of a character that other mines dare not handle and would cast over the dump, yet it has constantly added better facilities for ex raction and milling and has steadily increased its yield. Her output in the past year is something to be proud of, and Superintendent R. K. Colcord has proven conclusively what can be accomplished by careful management and close calculations. There were extracted 14,096½ tons of ore, all of which was reduced, yielding an average of about $11.29 per ton. The cost of reduction, etc., amounted to $8.03 cents per ton. The mill run steadily the entire year, with the exception of 60 hours—24 of which was on the Fourth of July.

BULLION OUTPUT OF SYNDICYTE MINE IN 1884.

Total	$494,534.84

The Bodie Consolidated.

The year 1884 has added one more memorable peg in the annual list of excitements, to which this mine has been subjected. By careful reference to the tables, it will be seen that she made her maiden effort—the biggest of all—in 1878, and in the following year done even better than in 1884. Then followed several years of prospecting with a moderate yield of bullion, and a few assessments, after paying dividends to the extent of $1,295,000. One year ago the stock ran up from 80 cents to $16 and over. A large quantity was taken in the town of Bodie, and the general opinion prevailed that the manipulators would allow it to reach the old-time figure of $75, before the stock was watered. While the hears appear to have got the best of it and continued hoss of the situation, the present management deserve credit for withholding $100,000, with which to further prospect the mine. Several large dividends were declared with apparent recklessness last season, but after the first excitement was over, the stock continued firm, with very little fluctuation. Fifteen stamps were employed in the Bulwer-Standard mill, on Bodie ore, from about the 5th of June till the 20th of July. The little Bodie mill down the canyon was employed until the first cold water shut off the water supply. The following tables will show what part the Bodie Con. played in keeping up the record of the district:

BULLION SHIPMENT OF THE BODIE CON. MINING COMPANY FOR THE YEAR ENDING DECEMBER 31, 1884.

ENGINEERING NOTES.

ELEVATED RAILROADS SAID TO BE UNSAFE.—The N. Y. *Herald* has an article on the danger threatening the elevated roads from the weakening of the iron supports and girders from the crystallization of the iron. It says that engineers and scientists are making the subject more a study, and experiments during the past 14 years substantiate the theory that the best of iron, when subjected to a continuous strain, will lose its fibrous qualities and show a crystalline arrangement of the molecules and becoms as brittle as castings. All authorities agree that the enormous strain to which the elevated track is subjected will cause the iron to crystallize and that the process cannot be detected by any outward signs. Theodore Cooper, the builder of the St. Louis bridge, said to a *Herald* reporter: "No man can say if there will or will not be a horrible smash-up on them some day. I do not care to express an opinion. Undoubtedly the structure is too light. It would have been much cheaper to have built it stronger in the first place, to say nothing of the safety. The road is being strained just twice as much as it was intended to be." Other engineers express similar opinions.

WEAR AND TEAR OF SHIPS.—If a vessel is strictly first-class and is well cared for, she will hold her rating 12 years. Then she must be carefully examiued, and if found in good condition her rating may he continued four years longer. But you will notice before the end of the twelve years that the captain don't carry on sail as he did the first trip. Even with a fair gale the topgallant-sails come in, and the mainsail will possibly be clewed up. If the ship has nged pretty fast, as she will under a captain disposed to drive her, the chances are that the captain gets out of her into a new ship again. A new man takes the old ship, and she drops out of the trade to 'Frisco or China, and carries guano or coal. When a ship has carried cargo for 15 years, even under favorable circumstances, she is an old ship. She is like an overworked man, she totters on her way. In a heavy sea she is longer rising on the swells, for she has somehow lost her buoyancy. Last of all she goes into the lumber trade, and there wallows her way from port to port, until some day her bones are laid upon a lee-shore, or she fails to rise when a heavy wave strikes her.

AERIAL NAVIGATION BY NIGHT.—Those enthusiasts who are sure that we shall soon be navigating the air as comfortably and regularly as we now traverse the sea, will find small comfort in the recent statement of a famous aeronaut, who asserts that no halloon has ever gone over a second sunset. The moment, he says, the sun goes down the gas condenses, and you get through the night better than the day. But the next day, in the presence of the sun, the gas expands and you mount to great elevations; but every mount the halloon makes cripples its power, and it is only a question of hours, if not of minutes, how long you can keep up. If an aeronaut could have 48 hours of night, he could travel a great distance. Unhappily for him it is not always night, and ws must even worry along with daylight and ordinary means of travel awhile longer.

NEW ORLEANS IN DANGER.—Capt. Eads, who has recently made an inspection of the situation, now declares that within two years the Mississippi is likely to be deflected from its present course past New Orleans down the Atchafalaya directly to the Gulf. Only a tough clay bar across Old river intervenes, and that is being rapidly swept out hy the current. The *Times-Democrat* calls earnestly upon Congress to do something immediately to avert the disaster to that metropolis, planting interests of Southern Louisiana, as well as the commerce of the great river. That paper asserts that an expenditure of only $12,000 to $15,000 is necessary to obviate the more imminent danger.

A NEW SIEGE GUN.—Experiments have lately been made by the Freuch Government with a new kind of siege gun of prodigious power. It is described as made of steel, and nearly 30 feet long, and the tube is strengthened with ten coils of plated steel wire one millimeter, or 1-69 inch in diameter. The composition is such that the cannon, after a few discharges, becomes elongated hy three millimeters. The weight of this gun is 50 tons, and it projects a shell weighing 297 pounds, capahle of penetrating armor plates nearly six inches thick at a range of seven and one-half miles.

ASPHALT IN CONCRETE.—A writer in a French contemporary records the very successful use of a concrete for foundations, made partly with asphalt. It is said that the slight elasticity or hard, rubber-like flexure of minute range of this material makes it superior to the hard foundations for engines and machinery where masonry or concrete is nsed. It acts to a small but useful extent as a moderator of shock.

STEEL CARS.—It has been proposed to furhnis the railroads with grain cars huilt entirely of steel. It is said that more grain can be earried with less wear and tear.

USEFUL INFORMATION.

The Philosophy of an Open Fire.

The normal temperature of the human body is 98 degrees Fahr. If it rises much above, or falls much below that, death will ensue. But the human body is a furnace in which the process of combustion is continually going on. Therefore, in order to preserve the normal temperature, the body must continually give off a certain amount of heat. By the laws of radiation, a heated body parts with its heat, more or less rapidly, in proportion to the low or high temperature of bodies near it. Thus, if a hot body be placed near a cold body, the hot body will radiate heat rapidly. If the hot body be near a cold body, the hot body will radiate heat rapidly. If the hot body be near a body less hot than itself, but still hot, it will part with its temperature slowly.

Let us apply this to a room. If you are sitting in a room near a cold wall, you feel what you think is a draft. It is not necessarily a draft. The side of your warm body turned next the wall, parts with its heat rapidly; and you experience a local chill. If you hang a piece of carpet against the wall, the draft is no longer felt, because it checks the rapidity of the radiation. Now, the chief source of heat in the open fire is its radiant heat, and as it warms the walls of the room and the furniture, it takes off any sensation of chill from them, although the air may be comparatively cool.

You must next hear in mind that the proportion of radiant heat, to the total heat given out hy a heated body, depends on the temperature of the body. Thus, with a red-hot piece of iron, or a flame, the great part of the heat given out is radiant heat, whereas, with a body heated to from 150 degrees to 200 degrees, like a hot water pipe, a comparatively small portion is radiant heat. Therefore, when you heat a room by means of hot-water pipes, or hy means of warmed air, the walls do not get warmed in the same proportion, and although the air may feel warm, the walls may remain cold, so that the heat of the hody may he radiated to the walls and give the sensation of chill. The comfort of the open fire is due to the warmth it imparts to the floor, the walls and the furniture. The air of the room is warmed, not by the rays from the fire, hut hy the warmth imparted by those rays to the various objects. Therefore, the air of the room is somewhat cooler than ths walls. Now, there is, undouhtedly, greater exhilaration produced by breathing cool air than hy breathing warm air. This is readily accounted for. One cubic foot of cold air contains more oxygen (because it is condensed) than the same volume of expanded warm air. It is thus desirable that air admitted to a room should not exceed from 55 degrees to 60 degrees temperature, for comfort in breathing.

A REPEATING MATCH.—A match that will strike several times over is certainly an ingenious invention, though it might not prove to be exceedingly useful. Such a match has recently heen invented. The Russian Department of Commerce and Manufacture has awarded a patent to the inventor of a means of so impregnating wood with a certain chemical that, when dried, the matches made from this prepared wood can be used several times over, thus effecting a saving of, it is claimed, at least 75 per cent. A further saving of matches is proposed to he accomplished hy an electric gas lighter, another novelty recently introduced. It consists of a tiny electric hattery which can he attached to a gas burner. The hattery is connected with a little reservoir of inflammahle material, sufficient in quantity to light 60,000 gas jets. One only has to turn on the gas, raise the lighter to it, touch a spring, and the gas is lighted. A man might consider some time hefore he concluded to go to the expense of having the electric lighter fitted up in his parlor, but it would certainly he hetter to expend a few dollars in this way, all at once, than to waste whole harrelsful of profanity as ths result of falling over things in the dark in the usual fruitless search for the match-hox.

THE STUDY OF FINGER-NAILS.—The study of finger-nails, the shape and color of which are said to indicate certain traits of character, is a new occupation. Long and slender finger-nails denote imagination, love of art, and laziness; if long and flat, they are the sign of prudence, good sense and grave mental faculties; if wide and short, of anger and rudeness, controversy and obstinacy; a healthy color signifies virtue, health, happiness, courage and liberality; dry and hrittle nails are signs of anger, cruelty, quarrel, culminating even in murder; curved in the shape of claws, hypocrisy and wickedness; soft, feebleness of mind and body; and, lastly, we are told that short nails, gnawed down to the flesh, signify silliness and dissipation.

IRON FOR BUILDING PURPOSES.—When it is considered to what an enormous extent iron is now used for building purposes, it is somewhat surprising to he reminded hy the death of Mr. Daniel D. Badger, of Brooklyn, that he was the first person in this country to employ it on a large scale in the construction of houses. Mr. Badger early in life established a foundry and rolling mill in Boston, and in 1842 erected in that city the first huilding in the world with exterior columns and lintels of iron. So doubtful were those for whom he built it of the success of this undertaking that they exacted a guarantee that if the iron so used proved unsuited to the purpose, he should substitute other material at his own expense. But he was not required to make the substitution. On the coutrary, he soon had more orders than he could fill, and gained fame and fortune hy his ingenious discovery. Mr. Badger died at the age of 78 years.

NEW SKATING SURFACE.—A new skating surface called "crystal ice," has been invented by Dr. Calantarients, of Scarborough, England. Considering that, after all, ice is merely a crystalline substance, and that there is no lack of substances that are crystalline at ordinary temperatures, Dr. Calantarients experimented with a variety of salts, and after a time succeeded in making a mixture consisting mainly of carbonate and sulphate of soda, which, when laid as a floor by his plan, can be skated on with regular ice skates. The resistance of the surface is just equal to that of ice, it looks like ice, and indeed when it has been skated on and got "cut up" a little, the deception is quite astonishing.

COPYING MANUSCRIPT. The following is a simple way of obtaining copies of writing without the use of a copying press: Mix white sugar with the ink, one and one-half drachms of sugar to one ounce of ink. Use this with an ordinary pen, and place over the writing a moistened sheet of unsized paper; lay both leaves between two layers of cloth; put the whole under a piece of board large enough to cover them; then put a heavy weight on the hoard for a few seconds, and an excellent impression will be found on ths copying paper.

CABLE ROADS.—A leading advocate of the cable railway system declares that its main advantages over the whole method of propulsion by horse-power are as follows: First, increased speed; second, the ahility to provide transportation to the full requirement of the public, even during what are called commission hours; third, cleanliness; fourth, absence of noise caused by the clatter of horses' hoofs; fifth, freedom from snow blockades in winter; sixth, superior construction of the cars and tracks.

GOOD HEALTH.

Wanted—A Sanitary Inspector for the Villages.

[Written for PRESS by I. H.]

The circular issued last summer by the San Francisco Board of Health was so full of wise and timely suggestions that in reading it a dweller in the country was tempted to envy the residents of the city. For, with all our superior advantages for health and length of days, there is one thing we lack—the sanitary supervision which becomes a necessity wherever human heings congregate in towns and villages.

So many dangers threaten the public health in the crowded precincts of the great cities that health officers and sanitary inspectors are appointed for the common defense. But away from these central points every man does what is right in his own eyes; and until the general intelligence of the people shall reach a much higher level than it touches at present, this entire license must he the source of many evils.

I have known a pretty and attractive country town, where, throughout the summer months, the principal street was filled with a noisome and disgusting odor whenever the wind blew from a certain quarter. It suited the convenience of the hutcher to have his slaughter-house in a central locality, and to feed a number of hogs upon the refuse in an adjoining yard. And while the whole community suffered from the nuisance there was no authority which could he invoked to ahate it. As a people we are very jealous—and rightly so—of any needless interference with our liberties, hut in cases like this a strong hand to deal with the offense and the offender would he a great hoon.

The highest medical authorities have declared that the much-dreaded scourge of cholera will inevitably reach our shores within the present year, and in view of this fact some precautions would seem to he necessary for us all. And country villages and farm-houses, which are not exempt from attacks of typhoid fever and diphtheria, need scarcely hope to escape the ravages of this foreign foe.

Impure drinking water is universally conceded to be a fruitful source of disease, an active agent in its dissemination, and in this respect the people of the rural districts are in a deplorable condition. Attention has already been drawn to this subject in the columns of the PRESS, hut it will bear further discussion, particularly at the present time.

A state of things exists among us, and passes unnoticed, because it is so common, which would fill us with horror and disgust, if it had been first discovered among the inhabitants of China or Ethiopia. A man huys a village lot, and proceeds to huild a house and establish a home for his family. His first step is to dig a well, and this he must do, for there is no other water supply. If he strikes an underground stream at a depth of 15 or 20 feet, he considers himself fortunate.

The next thing is to make a deep pit (the deeper the hetter), over which the privy is placed within a stone's throw of the well; and the comfort and convenience of his household are supposed to be secured.

All goes on happily for a time. But one day a mysterious fever breaks out in the family, or a sudden visitation of diphtheria, and it may be that more than one little coffin is carried out at the door. Yet, the sorrowing father never puts this and that together, or asks himself how far he is responsible for the calamity which has befallen him. One of the worst features of the case, too, is that the innocent must suffer with the guilty. It is of little moment that a man may be too enlightened to tolerate such a plague-spot on his own premises, if his neighbors on either side of him persist in poisoning the air and the water.

Is there no remedy? Will not some one in authority try to create a proper public sentiment in this matter? Would it not even be worth while for our Legislatures to spend an hour or two in the discussion of the public health, and perhaps to appoint a public health officer for the country districts? Something like sanitary commission might easily be organized in the smaller towns and villages, and empowered to examine and report upon matters affecting the general safety. Suggestions from such a source would probably carry some weight, and might avail to ward off the threatening danger. It surely seems a matter of importance. Six months hence, it may he too late.

Walnut Creek.

First Aid to the Injured.

Dr. Francis H. Tirrell, in his late lecture, medical series, before the Young Men's Christian Association took for his subject "First Aid to the Injured." The lecturer pointed out the desirability of making one's self efficient for emergencies, and explained that in the larger Eastern cities societies are formed for the purpose of enabling people to render assistance in cases of emergencies or accideuts. They were called the "First Aid te the Injured," and he had been requested to organize such an institution in this city. If it was established lectures would be given on hemorrhage, the treatment of the apparently drowned or suffocated, first aid for those suffering from shock or collapse or kindred subjects. He pointed out that in cases of emergency or accident nothing was so important as to have some one with coolness and information to assume command. Bystanders should leave room for breathing and action; the sufferer should be placed in a comfortable position, with the head raised a little; then an investigation should be made to ascertain what is wrong, and to decide upon the course to be pursued. Next send a written message for a doctor, so that he may come provided with the necessary appliances. In the meantime preparations should be made, but whiskey or hrandy should not be administered in large quantities, for their effect often misled ths doctor. Suggestions were then made in relation to the treatment of those who had fainted or suffered from a suspensiou of circulation, the care of those seized with an epileptic fit, the course to pursue in cases of apparent drowning, the temporary care of cases of dislocation and fracture and excessive hemorrhage. In the latter cases he explained that pressure should be promptly applied in front of the hend of the elbow, in the armpit, behind the knee or just helow the groiu, as the case might be. This pressure could be made with the finger, a knotted handkerchief, a bandage or other means of pressure upon the main artery.

THE HAIR.—Prof. Wilson, of England, is high authority on the hair. He condemns washing it, and advises, instead, thorough hrushing. This promotes circulation, removes scurf and is, in all respects, hetter than water.

Cutting the hair does not, as commonly thought, promote its growth. Most of the specifics recommended for haldness, not excepting petroleum, are mere stimulants and are seldom or never permanently successful. Some of them give rise to congestion of the scalp. When a stimulant is desirahle, ammonia is the best. It is safe.

For falling out of the hair, Dr. Wilson prescribes a lotion composed of water of ammonia, almond oil and chloroform, one part each, diluted with five parts alcohol, or spirits of rosemary, the whole made fragrant with a drachm of oil of lemon. Dah it on the skin, after thorough friction with the hair brush. It may he used sparingly or abundantly, daily or otherwise.

For a cooling lotion, one made of two drachms of borax and glycerine to eight ounces of distilled water is effective, allaying dryness, subduing irritahility and removing scurf.

Both baldness and grayness depend on defective powers of the scalp skin and are to be treated alike. What is needed is moderate stimulation, without any irritation. The following is good; rub into the hare places daily, or even twice a day, a liniment of camphor, ammonia, chloroform and aconite, equal parts each. The friction should he very gentle.

THE BRAIN AND THE TEETH.—The French medical journals have recently been discussing the relation of teeth to the brain, and their conclusions are of considerahle importance to brain-workers. It seems to have been clearly established that excessive and prolonged mental labor causes the teeth to decay by consuming the phosphates which would otherwise nourish the dental structures.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador *Sentinel*, Feb. 7: The Amador Con. mine has finished sinking and reached a depth of 1500 feet. They are now running a cross-cut north and have encountered some very good rock. The Lincoln is still running and hoisting rock from the 100-foot level.

EUREKA.—Cor. Amador *Ledger*, Feb. 7: Sinking at the Eureka was finished several days ago. A drift has been run east a distance of 30 feet, where a body of quartz was encountered, the extent of which is as yet unknown. They have cut into it six feet, without getting through it. Judging from the general appearance of the rock, those that are well posted on such matters consider it of good paying quality, although the result of actual milling alone can settle this point beyond dispute. Slowness is still the order of the day at the Mahoney. There is about 100 feet of water to be taken from the shaft yet, and as there is only one pump running, it will be some time before the bottom is reached. The company have been at an outlay of something like $10 per day for many months and really nothing has been accomplished.

LAMBING.—The Lambing mine has started up again, employing about 20 men. To persons interested in mining a visit to this locality is exceedingly interesting, illustrating what pluck and determination may accomplish. About 30 feet of the surface is first removed, exposing the gravel bed, which is said to be exceedingly rich. Supt. Lambing will put on about 75 men some time during the montb.

REDEEMED.—Amador *Dispatch*, Feb. 7: The money was received a few days ago from Boston to redeem the Kelly mine, which was sold at sheriff's sale several months ago, and it is presumed that the Company will resume work in a short time. W. G. Anderson, of the New York mine returned from below last Sunday whither he went to purchase iron for laying a track at the mine. Work at the mine is progressing with a vim and the prospects are very encouraging.

Calaveras.

MILL STARTED.—Calaveras *Chronicle*, Feb. 7: The gravel mill on Tunnel Ridge, owned by Veith and Company, was started last Saturday and we look for good results.

Inyo.

COLUMBIA MINE.—Inyo *Independent*, Feb. 7: At the beginning of the year Frank Silva made a relocation on the Columbia mine, at Darwin, a claim on which a good deal of work had been done some years ago, but which had been abandoned in the interval. Silva began work at some distance from the old shaft, and after clearing away some loose stones and earth, struck a vein of good ore. He now has a new shaft down about 40 feet, and at that depth the ledge is two and a half feet wide, and the ore is of good quality.

WHITE HILL MINE.—Alexander, Barnes & Kehoe are loading cars with ore from their mine, the White Hill, in Beveridge district. The ore will be sent to Selby & Co., San Francisco. Mr Alexander reports the mine looking well. He says, "If it keeps up its lick we're all right."

LUCKY JIM MINE —Mr. J. S. Corman has men at work in the Lucky Jim mine, at Darwin. A good supply of ore has already been got out, and the furnace will soon be started for a run.

El Dorado.

TUNNEL.—Georgetown *Gazette*, Feb. 7: Mr. Clark is still engaged in extending the tunnel in the Graves mine at Volcanoville. Some two years ago an attempt was made by a company to discover the extension of the rich ore chimney taken out to a depth of some 80 ft several years ago, by running a tunnel, but the company failed to tap the ledge. Since that time Mr. Clark has done considerable drifting to the right and left in search of the lost lode, without success. Recently he got it into his mind that the tunnel had not been driven far enough ahead, made a careful survey of the distance, which strengthened his opinion ,and now the energetic miner is driving the tunnel ahead with a vim.

Mariposa.

HORNITOS.—Cor. Mariposa *Gazette*, Feb. 7: Every week some new diggings are found, and new quartz veins discovered, still no mine in the county has been entirely developed. While the days of '49 are for many others, a thing of the past, the millenium is still to come for us. Gold is daily brought into our village, and not later than last week a pocket of nearly $2,000 was struck within the town limits.

Nevada.

CHAMPION MINE.—Nevada *Herald*, Feb. 5: A crushing of nearly 30 tons of quartz from the Champion mine has just been completed at the Deadwood mill, and the results, we are informed, were very satisfactory. There was a large amount of sulphurets saved, which is valued at $125 per ton. All operations at the Champion have been suspended, to await the outcome of the lawsuit now pending between the Champion Co. and the Wyoming Co.

NORTH STAR MINE.—Grass Valley *Union*, Feb. 7: The steam pump which is in use in relieving the North Star mine of water, has been throwing a large and almost constant stream for several months and has finally cleared the 500 level, which is the most extensive opening in the mine and held a great body of water. Yesterday the work of putting in a 16-inch plunger pump from the surface to the 500 level was commenced, which will take about one week to put in place. This pump, which is a massive affair, will be permanent, taking water from a tank at the 500. Below that level the steam pump will be used in draining to the bottom of the mine, after which a 12-inch pump will be used to force the water up to the tank on the 500 level. After the big pump is in place the work of pumping out the lower levels will go on much more rapidly, as the openings are not so extensive. In the course of two weeks a force of tributers will be put to work in the stopes of the 500 level, and as the other levels are drained the number of tributers will be increased, so that it is expected that several hundred men will be engaged in taking out rock in the course of a couple of months. The hoisting and pumping works of the North Star are of the most complete and substantial character, and the engines powerful enough for all demands that will be made upon them. Everything about the mine is put up for the permanent working, as the amount of ground yet to be opened up will require many years.

DUMP WORKERS STOPPED.—*Tidings*, Feb. 7: For a long time past a crowd of young boys have been picking out the quartz in the waste rock from the old dump of the closed-down Eureka mine, and having it crushed at the custom mills. Some of the ore taken from this old dump would go as high as $28 per ton. The boys would take every piece of rock that had a stringer of quartz in it, would accumulate a load of it and then have it hauled to the mills. By this means the boys did a great deal toward supporting poor families, and were perfectly delighted with their prospects. Some of them asked our reporter, months ago, not to speak of their success, for they were afraid of being stopped. We kept this secret faithfully. But a change has come over the spirit of the boys' dream. Some person here has informed Mr. Robert F. Morrow, the San Francisco capitalist, about the dump-pickers, and as he has the management of what is left of the Eureka, he has ordered the boys to cease their work or else pay a percentage for the gold.

Sierra.

A GOOD CLAIM.—Sierra *Tribune*, Feb. 4: The Belmont ledge at Poker Flat is proving itself to be a veritable bonanza. Poker Flat can lay claim to one of the richest quartz ledges ever uncovered in this county. The Belmont was located a number of years ago, and at various times since, considerable work has been done upon it. Last Thanksgiving, however, the parties discovered gold in the rock of sufficient quantities, to warrant them in pushing ahead work with renewed energy. The more work they did on the ledge the better prospects they obtained. A few weeks ago they commenced pounding out the ore in a hand mortar, and in three days took out $1,500. It is not known how much they have taken out in addition to this amount, but it is stated to be quite large. Two tunnels have been run on the vein. The upper tunnel is in 40 feet, and the lower one about 100 feet. Fifteen feet from the mouth of the upper tunnel a shaft has been sunk to a depth of forty feet, and it is from there that the ore has been taken. Only the very rich specimens have been pounded out in a hand mortar. The balance of the quartz has been placed in a dump, and as the ledge is from three to four feet in width, considerable ore must have necessarily been taken out in sinking the shaft. The whole vein shows very rich rock, and the owners cannot be mistaken in placing the value of that already in the dump at a high figure. The upper and lower tunnel are about ninety feet apart. The ledge is easily traced for a long distance on the surface. About one-quarter of a mile distant from where the Belmont Co. are working (on the opposite side of the creek), another party has recently obtained some fine prospects on the same ledge. It is the opinion of experienced quartz miners who have examined the Belmont workings, that the rich chimney now being worked is a permanent thing, and will extend down to an indefinite depth. The width of the pay chute at present being worked is not yet known, but work is being driven ahead in both tunnels night and day. It is the intention of the parties to erect a suitable quartz mill in the spring, and a site is now being cleared for that purpose. The lucky owners of the Belmont are P. R. Gardner & Son, M. Barth, J. Haas, M. Bowers and Fred. Herman.

DRIFTING RESUMED.—*Mountain Messenger*, Feb. 7: The B. M. Extension Company, which stopped drifting three weeks ago, in order to finish its incline, finished that work last Sunday, and on Monday put on 40 men. The incline is 260 ft in length, with a pitch of 1 foot in 4, making the perpendicular rise 65 ft. The upper part of the incline for a little more than half the length, has a double track, while the lower part has only a single track. At the junction of the double and single track there is an automatic switch, which is set by the descending loaded cars. The drum is two feet in diameter and is 25 ft from the head of the incline. Two steel ropes, half an inch in diameter, and each 300 ft long are used, unwinding from the center of the drum towards the ends. The break used is an ordinary strap-break, having a compound lever attachment, making it automatic to the extent that it will, by its own weight, hold two loaded cars on the incline. The whole outfit worked smoothly from the start, two loaded cars being lowered in about 30 seconds. The double shaft through which gravel was at first taken out, has been utilized by placing in one of the compartments an air-blast. The air which comes in through 6,000 ft of 11-inch pipe, is taken by this air-blast down the 60-foot shaft, and forced up and on into the drifts and tunnels, bring the works, so far as ventilation is concerned, for an indefinite period within the last mentioned distance of daylight. Over three inches of water is now falling in the shaft, which amount will be increased as more ground is opened.

FOREST QUEEN.—This quartz mine, owned by Dr. F. M. Biber, one-quarter of a mile up Slug canyon, is being thoroughly prospected by A. N. Whitelaw and Geo. Fries. The first ledge was found 30 ft in from the mouth of the tunnel. Width of second ledge is 4 ft. The main tunnel is in 120 ft, blasted through red serpentine, striking the ledge between slate and serpentine. A very good prospect was obtained last week. The ore averages about $25 per ton.

BALD MOUNTAIN.—The Bald Mountain Company has discovered some exceedingly rich ground in the bottom of the lava channel, where it crosses the original channel. Prospects of $100 to the pan have been obtained. How much of this rich ground there is cannot yet be determined, but in all probability there is enough to warrant running a tunnel for. The company is now enlarging the single-track incline, to enable it to work to better advantage. The perpendicular depth reached is about 30 feet. Empire Co., at Howland Flat, employ 45 men, and cleaned up 76 ounces last week. Gravel averages two and three dollars per carload. From 70 to 80 ounces are taken out every week. Work is being prosecuted on the Lilliput gravel claims, situated in the main ridge near Milton. These claims were located come years ago by Aaron Bechtel, since deceased, and partially developed by him, but have since mainly passed into the hands of Mr. Holdsworth. Wm. Hanley and H. H. Noble, of the Rainbow mine, came up from below last Sunday. The lower tunnel in this mine has reached the ledge, which gives promise of being as rich as it was in the shaft above. The work of connecting the tunnel with the works above has been commenced.

Shasta.

SUNNY HILL.—Shasta *Courier*, Feb. 7: Sunny Hill, which lies five miles west of Ono, will be a lively mining camp ere six months roll by. Messrs. Patten and Day have bonded some of the mines and are at work now. The mill will be here this week, then shortly, we hope, Wells, Fargo & Co. will have bullion to carry from this place. The superintendent F. W. Day, is an assayer, and thoroughly understands the working of ores containing base metals. H. Caswell, the foreman of the mines, is an experienced man at that business; so with Day as superintendent and Caswell as foreman, we are satisfied, if the ore is to be found, they will make it pay. J. E. Spencer is in Frisco and will return shortly with a mill for his mine; then Sunny Hill will boom.

San Bernardino.

CALICO CROPPINGS.—Calico *Print*, Feb. 8: Considerable improvements have been made on the Occidental mine within the past two or three months. A large ore bin has been made at the southwest end of the mine, above which is a canvas structure in which the ore is assorted. A car track over 1,000 feet long has been laid around the west side of the hill from the north, which terminates at the assorting platform. Ore is taken from the numerous openings and run over this track to the main dump. Four tunnels, ranging from 70 to 300 feet, penetrate the hill from the west and south. Sinking and drifting is progressing at various points, from which fine ore is being extracted. Nothing less than $100 ore is taken to the mill. Frequently rich pockets are discovered that yield thousands of dollars. The extent of the ore bodies is not known. Work is now progressing on a belt of ore 400 feet wide by 600 feet in length. This mine is fast developing into a first-class property. Work is still progressing in the Garfield mine with most satisfactory results. Great caverns have been made in excavating the rich deposits of ore. Between two and three thousand feet of openings have been made in the mine. Several tunnels have been driven in, the longest of which is 1,300 feet in length. The lowest depth is 460 feet, from which point rich ore is taken. The extent of the ore bodies in this mine is immense, and it will require an ordinary life-time to exhaust the mineral, if it is possible to exhaust it. Over 2,000 tons of ore that milled from $100 to the ton and upward have been extracted. It is reported that the King mine is about to erect new hoisting works, preparatory to more extensive operations towards developing the large ore-body believed to exist in the lower levels of the mine. In the mean time it is probable that a diminution of the working force may take place temporarily, and night work be shut down for a short time. But there is everything to justify the belief that, when the proposed improvements are completed, the out-put of the King will eclipse anything heretofore shown in that wonderful ore deposit. J. S. Collins, of Daggett, gave us the following item in regard to mines in which he is interested. In January, 1884, Collins, Carlysle and Garnett relocated the Oriental No. 5 mine adjoining the King, and called it the Jersey Lily. They leased it to Wm. Hale, who commenced work last December. The ledge is from six to eight feet wide and runs towards the King. The ore on top assays 109 ozs. That which has been sacked will not $150 to the ton. The work of breaking down and following the vein on the wall is progressing. These parties also located another claim between the Jersey Lily and King called the Olio. It has a 20-foot shaft, a tunnel in 20 feet and several tons of ore on the dump that assay from $80 to $300, and will average about $90. J. S. Collins, Tom Lee and Wm. Sullivan have located the second claim on the west of the Sue, north of Lone Star. Tunnel is 30 feet in ore. Assays from 50 to 400 ozs. Have been working since December 20, 1884. Sinking is still progressing in the Bismark at a depth of over 100 feet in the midst of a broad ledge of rich ore. A long tramway and chute, and a large ore bin are being built at the south end. Preparations are being made to develop the mine on a large scale.

Tuolumne.

JUMPER.—*Union Democrat*, Feb. 7: The Fitzgerald Brothers have re-opened the Jumper mine, situated about two miles south of Quartz mountain. Considerable wealth has already been yielded by the Jumper, and the boys, having an encouraging prospect, feel confident that there is still money in it. The new steam pump at the Eagle mine is working satisfactorily, and the mine has been drained of water. As nothing now stands in the way, the work of development will be vigorously prosecuted. Some very good rock is being taken out of the 367 ft level of the Lamphier mine. The chute is looking well and gives promises of continuity. The mill will be started up for another run in two or three weeks. Operations on the Riverside mine, about 15 miles above Columbia, have been resumed under the direction of James Barron. A considerable force has been put to work, and prospecting will be conducted by means of a diamond drill.

Trinity.

WATER.—Cor. Trinity *Journal*, Feb. 7: Miners are now all at work with a good supply of water. More storm is promised and is needed to keep up the supply. There is very little snow on the high mountains.

NEW RIVER.—Cor. Trinity *Journal*, Feb. 7: Mild winter so far; not much doing in the mines. The Eureka public are wide awake; hope they will get good returns for the capital invested. Their principal mines are represented as follows: Ridgeway, Geo. Dean, Supt.; Golden Gate, bonded for $11,000, W. W. Webb, Supt.; Hunter & Hoo-che-noo, bonded, J. McCormick, Supt.; Syndicate Company, E. McDonald, Manager. When grub gets plenty and weather permits, all will be at work. Hard Tack is working a few men; arastra running and good clean-up anticipated. Ridgeway has some men to work; about 80 tons of ore on the dump; going to put up a mill in the spring.—T. Baker of the Tough-Nut, says his arastra will be completed before spring; they have about 70 tons of ore on the dump which will go $100 to the ton. Mary Blane is all right; will start as soon as weather permits. Grover Cleveland, owned by A. Powell, C. H. Anson & Co., will be one of the boss mines of New River; they don't blow the horn and don't care about selling; it is "whole hog or none." By the way, allow me to give a hint to your placer miners. Our richest quartz mines are on Slide creek and tributaries, H. S. Soule, before winter sets in, made as much as $6 per day on the top gravel, not getting to bed-rock. F. M. Kerby also placer mined last summer with good results; he did not get bed-rock. The creek from mouth to top has never been worked, except by the two parties just mentioned. It is supposed to be 15 or 20 ft to the bed-rock. I am no judge of placer mines; those who are, say it is a good show, perhaps a fortune for those who have bone and muscle to back them. The ax, hammer and saw are all the go. Lumber, $60 per 1,000, enough can't be had at that. Thanks to A. E. Yocom & Co., their saw-mill will be completed in four weeks. Three towns started—New River City, Larcineville and White Rock. Stores, hotels, saloons, etc., are going up in all three.

BULLYCHOOP.—Cor. Shasta *Courier*, Feb. 7: Commencing with Bullychoop district, which lies mostly in Trinity county, but supplies are purchased at this place, bids fair to be one of the richest mining districts in this section. Haskin Bros. and J. E. Enright have found an exceeding y rich body of ore in the Little Gem mine, of which they are the owners. Joseph Henry and Davis Bros. are running a tunnel which will tap the Pound Cake ledge at considerable depth. The Bullychoop M. Co. took out quite a lot of ore during last summer. Several other good mines in the district, but are not being worked this winter.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Feb. 7: The water is fast draining out from the old Mexican shaft and the surrounding ground on the 500 level. The north lateral drift on the 500 level is being advanced rapidly. It is being run along the west wall and will be continued through the old Mexican and Union Con. ground.

GOULD AND CURRY.—Work below the Sutro tunnel level has been discontinued. The new joint station on the 1000 level of the Bonner shaft is nearly completed. When finished explorations will be made in ground never before prospected.

BEST AND BELCHER.—The joint station on the 1000 level of the Bonner shaft being completed, the Gould and Curry will run a north lateral drift to the Best and Belcher line, and the latter company will extend it through their own ground.

CROWN POINT.—A large amount of low-grade ore is being extracted and sent to the mills on the Carson river. A considerable amount of prospecting is being done at various points for the purpose of opening out new deposits.

YELLOW JACKET.—The old upper levels still continue to yield a large amount of low-grade ore, ore, which is sent to the mills on the Carson river for reduction. Explorations are being made at various parts of the mine.

SIERRA NEVADA.—Preliminary operations have been commenced on Cedar Hill in the old Sacramento ground and work will be started at other points in the same locality.

HALE AND NORCROSS.—The connection having been made in the Combination shaft on the 3000 level, the Hale and Norcross will start in immediately on the work of exploration.

SAVAGE—E-street tunnel is passing through the old stopes and they expect to find ground containing low-grade that will pay for working.

UNION CON.—A drift has been run north from the Ophir on the 500 level, which will open up a large area of ground hitherto unexplored.

COMBINATION SHAFT.—The new hydraulic pump on the 3000 level is doing all the work required of it, and could easily do more.

CON. CALIFORNIA AND VIRGINIA.—Repairs in the main drift on the 1550 level are being made.

BELCHER.—They are extracting the usual amount of low-grade ore and shipping it to the mills.

MEXICAN.—A drift running north from the Ophir on the 500 level is nearly completed.

Indian District.

RICH ORE.—*Silver State*, Feb. 7: L. F. Dunn, who has had two men at work all winter, prospecting in Indian district, has struck some very fine ore, with a good prospect of finding a large body of it, in the Illinois mine. The ore contains chloride and ruby silver, and resembles the rich ore found in the Moonlight mine, which adjoins it, years ago, which was worth over $3,000 per ton.

Eureka District.

SOME OF THE PRODUCING MINES.—Eureka *Sentinel*, Feb. 8: The Bowman, which is now worked by tributers, shipped 11½ tons of ore to the furnaces recently. The Marguerita, another Adams Hill property, shipped 4½ tons of ore to the Richmond furnaces last Thursday. Several tributers are working in the General Lee, on Adams Hill, and on Friday last made a shipment of 7½ tons of ore. In the Dunderberg mine, on Prospect mountain, 14 men are employed. Thirty and a half tons of ore were shipped since the 31st ultimo. The King Lear, on Adams Hill, which belongs to Messrs. Whittenburg & Spencer, shipped 30 tons of very good ore to the furnaces the other day. The Silver Lick, on Adams Hill, which was leased some time ago by some Cornish boys, is producing good ore. Twenty men are at work in the mine. The Phœnix, on Ruby Hill, which mine is owned by a San Francisco company, made a shipment of 8 tons of ore to the furnaces during the past week. The Massachusetts mine, in New York canyon, is said to be a very promising property. From it were shipped during the week 7 tons of ore to the Richmond furnaces. The Oriental and Belmont mine on Adams Hill, which is worked by Messrs. Ball & Poplin, shipped to the Richmond furnaces the past week 10 tons of good milling ore. The Eldorado, one of the Ruby-Dunderberg series on Prospect mountain, is looking well. Mike Moran, who has a lease in the mine, shipped 7 tons of ore to the Richmond furnaces recently. The Hamburg mine, on Prospect mountain, the property of a San Francisco company, also shipped 89½ tons of good ore to the furnaces during the same time. Fourteen tributers are at work in the mine. The Lord Byron continues its shipments. Some 26 men are employed in the mine, but only one shipment of 8½ tons of good ore was made from

it the past week. The assay value of the ore, we understand, was over $100 to the ton. The Mimbres, a property on Adams Hill, which has produced about $20,000, made a shipment on Thursday last of 5½ tons of good ore. The mine has an immense ledge of mineral, from which shipments will doubtless be made for many months to come.

El Dorado District.

MILL RUNNING.—Pioche *Record*, Feb. 4: The mill of the Southwestern Company at El Dorado continues to run steady. The mill of this company has been hammering away for months crushing ore, and the prospect is that it will continue so for months to come.

Hiko District.

EXAMINING.—Pioche *Record*, Feb. 4: Matt. Cullen and Pat Kyan, of Salt Lake and Frisco, passed through town on Thursday afternoon on their way to Hiko to examine a mine there in which Eugene Howell is interested.

Jackrabbit District.

QUIET.—Cor. Eureka *Sentinel*, Feb. 7: Having been over in Lincoln county recently, I thought I would let you know how things appeared there to a wanderer. The county is at present very dull, as her mills and mines are, with a few exceptions, closed down, but her people are hopeful of a revival of matters generally at an early day. The town of Bristol, some 23 miles north of Pioche, is very quiet at present. Why it is so I cannot understand, as the town has fine facilities for reducing ore, and there is a jacket furnace of 20-ton capacity, also a 20-stamp mill, complete in every respect, which cost the owners $85,000. Both mill and furnace are idle, and the town is almost deserted. The business houses are all closed, with the exception of two hotels.

Mount Cory District.

TUNNEL.—Walker Lake *Bulletin*, Feb. 5: The tunnel of the Snow Bird mine is in 175 feet and is now just in the ledge. George McKenzie has sold his interest in the Snow Bird mine to Ed. Kinney. The North Star mine is getting better every day. Men are at work running for the ledge on the Silver Brick. Gallagher is working a force of men on Blanchard's mine, the Welcome. The tunnel is 375 feet and in 20 or 30 feet more the ledge will be cut. It is very rich on the surface, and a number of people will be happy if it holds out in quality. Prospectors are still coming here and everybody is looking for good times.

Mineral Hill District.

MILL CLOSED DOWN.—Cor. Eureka *Sentinel*, Feb. 6: After a long and successful run the mill at this place was closed down yesterday for want of wood, and will remain idle for six weeks or, perhaps, longer, much depending on the weather and state of the roads in the mountains. The company failed to secure a sufficient quantity of wood to carry them through the winter, and the snow is too deep in the mountains to think of getting it now. Quite a force of choppers are busy cutting, and as soon as practicable the contractor will commence delivering his new contract of 500 cords. During the stoppage some necessary repairs will be made about the mill and the machinery, and it is expected that when again started the mill will run uninterrupted until next winter. In addition to a successful output from the tailings, the battery crushed about 250 tons of ore from the Hill.

Sylvania District.

SALE.—Candelaria *True Fissure*, Feb. 7: A sale of a big base metal mine in Sylvania district was recently made to George Storey. The consideration was $10,000.

Santa Fe and Silver Star District.

INCREASED MILLING FACILITIES.—Candelaria *True Fissure*, Feb. 7: The season is near at hand when the yearly operations, during the pleasant weather, will again commence on many small mines in this vicinity and at other points not far distant from the railroad. This will be particularly true of the mines in Santa Fe, Silver Star and the mining districts south of here. The mills at Belleville will soon be prepared to do any amount of reduction of such ores as may be taken out, and the railroad company will make a freight rate that can be but satisfactory. In addition to this, the fineness of good work in the mill mentioned is an established fact, and there will be no need to go outside of the county or away from the railroad to have this work done quickly, effectively and well.

Sylvania District.

BASE METAL.—Walker Lake *Bulletin*, Feb. 7: Sylvania mining district, near the south end of Fish Lake Valley, has many valuable base metal mines. Its lead-silver ores are easily worked, and some time it will be a lively place. It is rumored that George Story recently purchased one of the claims for $10,000 and intends to erect a furnace.

Taylor District.

AT WORK.—Cor. Eureka *Sentinel*: When I got back to Taylor I thought it a lively camp indeed, as work is being actually prosecuted in the Argus Company's ground, or group of mines. The ore improves in quality of grade, and it now exceeds $100 per ton. With their splendid mill and other improvements, the members of the company ought soon to be millionaires, as their ore is within 50 feet of the surface and is worked to the best possible advantage.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, Feb. 6: North drift 150-foot level, has been driven the past week 32 feet. No other work in progress at present.

INDEPENDENCE.—South drift, 400-foot level, has been extended a total distance of 1,002 feet. Crosscut east, same level, has been advanced 23 feet.

NAVAJO.—Station for No. 1 winze, on the east lateral vein, 350-foot level, has been cut out, and the work of sinking the winze to connect with the 650-foot level has been commenced. During the coming week, work will be suspended underground to permit the replacing of a few sets of timbers in the shaft and new sills under the gallows frame, and then the pumps will be started to drain the 630-foot level. Mill has closed down, pending the settlement of the question of reduction of wages.

Willow Creek District.

RICH STRIKE.—*Silver State*, Feb. 7: From parties who come from Willow Creek, we learn that a rich strike has been made in the Emma mine. Mike Leonard and Thomas O'Neal, who leased the mine about two months ago of S. W. and F. M. Ruse, of Winemucca, H. H. McColly, of Willow Creek, have been working along steadily, and now they are taking out ore that has been assayed and found to go as high as $455 per ton. That mine is liable to make some parties rich.

ARIZONA.

TOMBSTONE NOTES.—Tombstone *Epitaph*, Feb. 5: Rumor is rife of a possible heavy consolidation of two fine Cochise county properties. The Little Devil under skillful chloriding, has wreathed its management with angelic smiles. Very high-grade rock was discovered in a south drift from the main shaft of the Independence a few days since. Galena ore in large bodies, samples taken for average from which assayed 84 ounces, has lately been discovered on the eastern slope of the Chiricahuas. You may be credulous, but within the past two months two tons and a half of ore have been sacked from a supposed small mine in this camp that will go $12,000 per ton. Not such a bad county this, if you only catch on. From a gentleman from the lower San Pedro we learn that the owners of the gold properties between Williamson's ranch and Lee's spring (up in the oak openings, ten miles from the San Pedro, elevation 7,000 feet) have just cause for much joy.

BISBEE.—In that gem of copper bonanzas, the Bisbee Queen, a strike was made some four days since of high-grade copper ore on the 500 level, south of the main incline, but how immense is yet to be determined, as since the strike no waste has been encountered in running the prospecting drift.

DOS CABEZAS.—The gold mill at Dos Cabezas is reported to be turning out gold bullion in such style as to indicate a healthy feeling in that section, and cause proper development of the numerous gold-bearing ledges to be found in that district. S. W. Wood, as a mill man, is the right man in the right place.

PUMPING.—Tombstone *Epitaph*, Feb. 4: The great interest now in the big mines here is centered in the pumping machinery. The extensive foundation for the Grand Central pumps has been completed and a large force of men is now employed in putting up the machinery. Mr. E. B. Gage, superintendent for the company, is exercising personal supervision, and the work is said to be, by old miners, the most secure ever erected on this coast. They are putting in the double-line 14-inch pumps with 20-inch sinking pumps. The machinery is said to be by men of experience the most complete that has ever been erected in the Territory. At the Contention mine, of which Mr. S. H. White is superintendent, the machinery for the pumps is now all in and will be ready to start up when the pumps and other machinery of the Grand Central are in position and in working order. The Contention has a double of 12-inch pumps with an 18-inch sinking, with a 500 horse-power and works a cataract, called by engineers a Davy cut-off. When these pumps start up it will create a demand for miners that will give employment to a great many more men than are now employed in this camp and will make Tombstone the liveliest city on this coast.

THE CENTENNIAL.—*Silver Belt*, Feb. 7: On Monday last, we visited the Centennial mine, in company with Superintendent W. E. Spence, and found the report of a rich strike having been made, verified by an inspection of the property. We first descended the main shaft to the 60 foot level. Evidence of pernicious mining done, under a former management, is everywhere observable on this level. There is still considerable ore in this part of the mine, of fair grade, which would pay if milled on the ground. The levels below are filled with seepage water, which, it is thought, can be taken out without much difficulty, and will probably be done soon. The Superintendent expressed the belief that rich ore would be found in the 216 level, which is the extreme depth of the mine. In several stopes between the 60 foot level and the surface there is good ore in sight. Ascending to the surface we were next shown where the recent strike was made. To the northeast of the main shaft on the side of the hill, where the ledge cropped out, a shaft has been sunk about 30 feet, following the dip of the vein, at an angle of about 90 degrees. A tunnel was run from the side of the hill to connect with this shaft at the depth of 12 or 15 feet. The surface indications were not misleading as good ore was struck before work in the shaft had progressed many feet and the vein has widened and the ore has grown richer as depth was attained. It is now about three feet wide and the pay streak—ore that will assay more than 100 ounces—is two feet in width. Some of the ore is very rich. The ore is being sorted and sacked as fast as mined. There is every reason to believe that the ledge is a large one as its trend is in the direction of the stopes, north of the main shaft in which there is good ore. On the opposite side of the aroya in an old tunnel, a cross-cut is being driven with a view of cutting the ledge which is distinctly discernable on the surface.

COLORADO.

GEORGETOWN MINES.—*Courier*, Feb. 5: A mill-run from the Seven-Thirty last Saturday, returned 678 ounces per ton. A ten-inch vein of ore was struck in the Irishman lode, in the Horse Shoe, last week. A mill-run from the Snowdrift last Saturday returned 228 ounces for first-class and 67 ounces second-class. Vivian & Co. and Pope & Co., lessees on the Baltimore, have each had some large mill-runs during the past few days. Five or six excellent shipments were made from the Terrible last week, the ore milling from 50 to 500 ounces per ton. A shipment of ore was recently made from the Saxon mine, which returned 3 7-10 ounces gold, 59 ounces silver and 28 per cent lead. The Victoria tunnel has passed through the body of quartzite and indications point to the near approach of the lode—probably the Cashier. We understand that Col. Baldwin, the new superintendent of the Terrible mine, is doing extensive work in cleaning, improving and placing the mine in condition for future operations. A. G. Elliott has leased the Stover lode, in Cascade district and commenced sinking the 40-foot shaft to greater depth. He has a good streak of ore which mills well in gold and silver. McNulty & Co., who are working the East Rogers through the Junction tunnel, have drifted west on the lode 300 feet and have a quantity of scattered mineral which runs 130 ounces silver per ton in one class. The lessees on the Vulcan mine have some splendid lots of ore ready for the mill. Dalin & Co. made a good shipment this week, but the returns have not yet been made. The mine is said to be looking well. Al. Lyons and Ed. Thompson are still cross-cutting in the Georgetown tunnel for the hanging wall of the Griffith lode. They have run a distance of 15 feet and yet no signs of the wall appear. A drift has been started east on the foot wall. Work has been resumed on the Talisman lode, an extension of the Boulder Nest, owned by F. Huet. The adit, which is in 300 feet, will be driven an additional 50 feet. In the breast is exposed two feet of ore, the character of which is copper and iron pyrites and galena. McVeaty & Co., lessees on the East Rogers, had $2,800 mill-run last Saturday. The first-class returned 490 ounces and the second-class 332 ounces silver per ton. They are working through the Edgar tunnel and have about six inches of mineral throughout a distance of 200 feet in the stope. Cochran & Co. are working in the breast of the 100-foot adit on the Maine mine, and have about three inches of good ore. Lane & Co., 100 feet east of the Cochran lease, also have about the same amount of ore, which mills over $500 per ton. Young, Tallman & Co., working on No. 2 level, are in good mineral. Another car-load of ore was shipped from Conway & Co.'s lease on the Silver Bank level of the Pay Rock mine this week. These lessees are taking out immense quantities of ore. The ore vein is a very large one and is holding out splendidly. The first-class ore runs as high as 500 ounces, and the second-class 150 ounces silver per ton.

GOLD STRIKE IN LEADVILLE.—*Herald*, Feb. 7: Probably the largest gold strike in the history of Leadville, if not of Colorado, was disclosed last Wednesday by the lessees of the Nellie S, on Printer Boy Hill. The ore body which consists of heavy red and dark blue talc matter, was encountered on January 15, but it was kept very quiet until recently. One hundred and thirteen pounds of the talc matter thickly charged with free gold was delivered to the Ore Stamp mill and on Wednesday last a gold button weighing 21¾ ounces, and valued at $388, was returned to the lessees, H. C. Rose, C. D. Coleman and Wallace M. Mercury. This would give it a valuation of $7,760 per ton. The red sand after several assays, shows an average of 31 ounces of gold to the ton, or $558. The ore body was exposed in an upraise and about 25 feet from the surface of the hill. The miners are wild with excitement, as it is regarded as the most important strike in years. The property is owned by Lieutenant Governor Peter Breene.

IDAHO.

THE MCLELEN STRIKE.—Wood River *Times*, Feb. 7: A gentleman who visited Bullion yesterday, to verify the *Times'* report of a big strike in the McLelen lode, returned last night. He states that the vein now shows 18 good inches of solid galena ore, which assays 400 and 438 ounces per ton. The second-class stuff adjoining goes 250 ounces, and all kinds will probably average all of 200 ounces at the sampler. The McLelen is undoubtedly a continuation of the Mayflower, which it joins at the north end but shows up even richer than that famous mine at the same stage of development. Nick Millich, the lessee, who is working 16 first-class miners, will realize quite a snug sum from his lease, as he can, within five or six weeks, if the vein continues to show ore as it appears it will do, begin extracting at the rate of $10,000 to $20,000 worth per month.

THE BULLWHACKER INCORPORATED. The Bullwhacker group, on Deer creek, has been incorporated in Philadelphia, and operations at the mines will be resumed early in the spring, and vigorously prosecuted. The Bullwhacker shows a continuous ore vein for over 100 feet.

MONTANA.

MOUNTAIN VIEW.—*Butte Miner*, Feb. 4th: The shaft on the main vein is now down 638 feet. Two levels have been run on the 500 and two on the 600. The south vein averages 100 feet in width, and the main ore body is 30 feet. Work is being done at present on the north vein. On the 500 a body of rich ore 17 feet wide has been struck. It averages from 26 to 50 per cent copper, and is shipped East. The chute is over 300 feet long so far as prospected. Ten thousand tons of second and third-class ore lays on the dump, but the first-class is all shipped East for treatment. The mine is working 16 men, and is hoisting good ore daily. Charles Larable is the owner.

THE CUSTER.—Mr. Geo. Fitschen has just received his certificate of battery assays for eight tons of ore shipped to the Amazon mill at Boulder, from the Custer mine at Basin. The property is owned by Fitschen, Peter Pfeifer and Charles Smith.

THE ZELIA, situated on the hill just east of Centreville, is working 12 men at present. The mine is owned by Wartenweiler and Kellog, and is under lease to Melvin & Kirmil. The shaft is down 100 feet and 2 levels have been run, one 200 feet west and the second 40 feet east. The men are extracting good ore from the four-foot vein, which is being milled.

CHIEF JOSEPH.—This mine, owned by Stewart Lowry & Co., has been leased to Reynolds, Edwards Maddern, Job and Holman. Eight men are employed on the claim, and rapid development is going on.

WILD BILL.—The ore is exceedingly rich—far more so than any other body ever found in the mine. The new vein tends more north and south than the other veins, and has every indication of permanancy. It is rich in copper, and at present the only ore raised comes from the new find.

RISING STAR.—The new hoist is approaching completion. In the mine the men are sinking from the 400 foot and drifting from the same level, but no ore is being raised.

THE JOSEPHINE.—Gold and silver property has been bonded to the Chrystal Mining Company, of San Francisco, for three months, $50,000. The company have also leased the mine for six months, and will begin work as quickly as the machinery can be erected. The mine is in Pipestone district, about four miles from the warm springs, and is owned by McBride, Headley & Co.

THE LITTLE MINER has been sold to San Francisco parties, providing the mine proves up as represented. The purchasers will arrive this week and examine the property thoroughly.

THE GOLD HILL LODE, owned by the Chris Weibold estate, and handled by Henry Weibold, has just been bonded for $20,000 to the Gould & Curry Co., of San Francisco, for one year. The same company also have a lease on the mine for the same length of time.

HARRIS AND LLOYD TUNNEL.—This property is bonded to C. C. Tripp, of San Francisco. Active work in the tunnel will be resumed about the middle of the present month. Work was commenced in November last, but owing to the depression in copper, the work ceased.

THE BELL is running a full force of men in the smelter. The rich ore coming from the mine at the rate of 100 tons per day cannot be handled at the smelter, and the company have been compelled to hire the old Parrott smelter's calciners. Three of the roasters were started up a few days since, and two more of the calciners will be started this morning.

NEW MEXICO.

GOLD HILL.—Cor. Silver City *Enterprise*, Feb. 6: Miller & Gibbons are on the eve of starting up their arrastra. They are now packing their ore to same so as to give it a fair test. Black & Parks are packing ore preparatory to shipping from the Golden Chief to the flat, where it is loaded on wagons to be delivered and worked at the Pinos Altos mill by Place & Johnson. Samuel & Henry have their shipment ready from the Bilk. Teams are now loading but did not learn the destination of the ore. Derbyshire & Clark are about to move to camp Lewis, where they have an extension of the Grand Tower, the property of Messrs. Lewis & Cottrell, which is daily looking better. Snyder & Snowden are piling up good ore on the dump of the Fraction, which appears to be of an excellent quality. George Goodwin's claims, the Yankee Boy and Dunderberg parallel, are producing some as fine ore as can be found in the country. He has ore that averages $1,600. There are no less than 13 claims preparing to ship ore, which certainly speaks well for a six months old camp. There is one of the best openings for reduction works here and an investment that with proper management could be made to pay a good per cent; it need not lay idle a day. Would like to see some mill men come into our camp and see for themselves that we are making no idle talk.

COW SPRINGS.—The Cow Springs mining district is attracting much attention in mining circles just now. The Carlisle company have $200,000 worth of tailings on hand, which will be treated at an early day. A shipment of 15 tons of ore from the Graphic mine at Cook's Peak, owned by Hudson & Taylor netted over $100 per ton to the owners. Regular shipments from this and other claims in Cook's Peak district are being made to the Kingston smelter, where this ore was treated. Messrs. Forbes & Elliott, owners of the bonanzas known as the Brush Heap and Andy Johnson mines, at Kingston, were in town this week and stated that three car-loads of ore are shipped weekly from their property, netting them $50 per ton. They are making more money than they readily spend hence their trip to New Orleans and the East. Colonel Amos Greene is now working ten men on the Galatea mine, which adjoins the Violar in the Pyramid district. This propertyas well as the Colonel, has a history that would be very interesting reading for some people. It is intimated that Louisville people will be let in on some of the Colonel's bonanzas in this country. E. A., better known as "Dutch" Henry, one of the locators of the Old Man mine, is reported to have struck it rich again in the San Francisco mountains. He writes that he has placer mines which he is working, and that pay $5 per day to the man, besides several good locations in the mountains. He will probably not be as lavish with this stake as with the last.

UTAH.

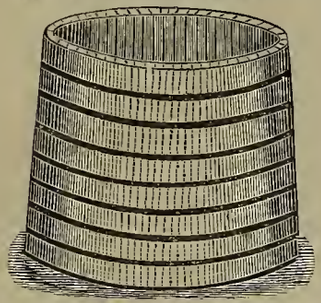
REVIEW.—Salt Lake *Tribune*, Feb. 6: The shipments of bullion and ore for the week ending Saturday, January 31st, inclusive, were as follows: 30 cars bullion, 660,588 lbs.; 20 cars ore, 549,068 lbs. Total, 1,210,068 lbs. The receipts of bullion and ore at the banks of this city for the week ending February 4th, inclusive, amounted to $122,401.31, of which $99,942.87 was bullion, and $22,458.44 was ore. The week previous the receipts were $70,071 in bullion, and $24,331 in ore. The receipts of bullion, exclusive of ore, for the month of January, were $378,644.56. The Ontario shipped during the week fifty-one bars of bullion, assaying $33,980.61. Total for year to date, $150,555.59. The Horn Silver furnaces are still turning out bullion in quantity and quality about as usual, but no shipments are made; the bars are piled up at the works. The Silver Reef district yielded $11,010 in silver during the week, of which the Christy supplied three bars ($5,930), and the Stormont four bars ($5,930). The Germania smelter turned out twenty-two cars of bullion ($48,671.26). The Crescent yielded ore to the value of $8,230 during the week.

STAR DISTRICT.—Frisco *Times*, Feb. 5, The Martin Bros. were in from Star on Thursday. They report mining in that district active. There are more men at work and prospecting than for many years past. The Don is being actively developed by its owners. Mr. Campbell has six men at work on the Moscow, the mine he recently bonded, besides a force on the Red Warrior. The Martin Bros. are doing profitable work on some of their mines. It is now confidently asserted that Mr. Campbell will shortly erect a concentrator and leaching works in Milford. If such be the case, it will be the means of creating a mining boom for Star, equal to, if not greater, than that of '72 and '73. With the proper facilities for the reduction of ores, Star is capable of supporting more men than any other district in Beaver county, not excepting San Francisco district, the seat of the justly famous Horn Silver mine.

UNION COMPANY.—The claims of this company adjoin the Crescent on the north and work is being done on them at present by Mr. David Avery who has a contract for sinking a shaft on them.

CRESCENT.—A visit to this celebrated property showed everything to be in fine working trim. The mine is still keeping up its record for being the largest producer of ore in the camp. There are at present some 90 men employed in the mine and it produces over 60 tons of first class ore and some 50 tons of concentrating ore per day. The first-class ore is shipped by teams to the sampler and the second-class is placed on a dump by itself at the end of the tramway where it will be handy for loading on the tram cars when the track can be used.

WATER TANKS.



Our well-known Water Tanks are made by machinery, from the best of materials, and shipped to all parts of the country. Each piece numbered. No skill required in setting up.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

SANBORN'S

New and Economical Chain Pulley.

[Invented by C. SANBORN—Patent allowed 1884.]

The engraving herewith illustrates a new lifting apparatus of that kind, in which great power is necessary, and which will stand and hold the load at any point where it is left. As the engraving shows, there is a pulley over which the lifting chain passes, and upon the same shaft two gear wheels, so fixed that their teeth alternate—that is, the teeth of one wheel correspond with the spaces of the other. The pulley on the right, over which the endless actuating chain passes, is fixed to a shaft, which has short crank arms formed upon it, corresponding with the gear wheels and with the size of their teeth, so that when the shaft is rotated the crank arms or pins engage the teeth of the gear wheels, one after the other, and thus advance the chain pulley. This device also forms a perfect lock when left at any point.

The hoisting-chain pulley, placed between the large gear wheels, brings the weight right under the supporting hook and balances the machine. The operator may stand on one side and haul on the chain, and need not be right under the apparatus. The device is simple, compact, strong and effective, and is quite ingenious in design. These machines have lately been put on the market, and are made here. The invention evidently improves, in a large degree, the construction of differential chain pulleys, makes them less in cost, weight, wear and repairs, and easy of handling and operating. The new device is worthy of the attention of manufacturers and all users of such articles. The size for a half ton lift weighs only about 30 pounds. Sample pulleys (for 1,200 lift), manufacturing rights and territory, will be sold on favorable terms. Apply to the SANBORN PULLEY CO., care this office.

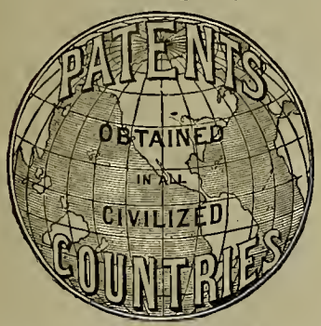
Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Mining Bills.

Very little has so far been done by the Legislature of interest to the mining community. In fact very few hills of any kind have been passed, though the session has not much longer to run. One hill, introduced in the Senate by Cross, of Nevada county, allows corporations to build dams and other works to restrain and impound mining debris. Places for the deposit of such debris may be condemned and taken by such corporation in the mode provided hy law for taking private property for public use Under tbis Act corporations shall act through their president, with the consent of at least two-tbirds of the stockholders. Each subscriber to such "articles" shall give a description of the water rights and ditch property owned by him or the corporation which he represents, and all subsequent subscribers shall give a like description; and such descriptions shall he duly recorded in the office of the county recorder in the county in which the property is situated; and such record shall he notice of the liens and rights of the corporation and the creditors thereof.

Rather a curious feature of this measure of Mr. Cross' is the provision that the uumber of shares of stock in such a corporation shall be equal to the estimated number of miner's inches of water which will probahly be discharged from the mines into the stream above the point where the impounding works are. Each subscriber of stock in the corporation shall take such a number of shares or stock as the numher of inches or units of measurement of water appropriated by him or the corporation he represents, to he used above the impounding works, hears to the whole capital stock of the corporation. Companies formed under the Act may levy such assessments as may he necessary to construct and maintain restraining dams, hut 10 per cent of all assessments must he paid into the State treasury, to be invested in State or Government honds to constitute a sinking fund to keep tbe dams in order in case the company should hankrupt. Provision is also made for fiue and imprisonment of persons who shall discharge into the stream above the works, rocks, stones, sand, gravel or earthy matter.

During the week the Assemhly has passed the bill to maintaiu the State Mining Bureau, hy which a regular appropriation is made by the State, and the institution does not have to depend, as now, on the proceeds of the tax on certificates of mining stock. The commissioner to the New Orleans Exposition proposes to spend $2,500 of the $10,000 which has been voted by the Legislature, towards exbihiting the State minerals at New Orleans. It is not, however, certain that they will he moved from here.

In the last number of the PRESS we gave the various bills concerning water rights which have been introduced. We also gave the Reddy bill providing for two shafts in mines for the safety of miners.

The following is the so-called "slickens" bill, which is now occupying the attention of the House, and which will cut a prominent figure in the legislation of the session:

SECTION 1. The State Treasurer is hereby authorized and required to pay all warrants outstanding and unpaid in their order, as drawn hy the State Controller, in accordance with "An Act to promote drainage," approved April 23, 1880, upon the construction fund of Drainage District No. 1, and all warrants drawn upon the State drainage construction fund, out of each fund respectively; provided, that if there is not money enough in said funds to pay all of said warrants, theu he shall pay the remainder of said warrants unpaid out of any money in the general fund not otherwise appropriated.

SEC. 2. The State Controller is herehy authorized and required to draw his warrants for all claims against Drainage District No. 1 that have been heretofore audited and allowed by the State Board of Drainage Directors; also all claims against the State drainage construction fund that have been heretofore audited and allowed hy the said State Board of Drainage Directors; and the State Treasurer is herehy authorized and required to pay the same out of any money in each fund, respectively; provided, if there is not money enough in said fuuds to pay all of said warrants, then the State Treasurer shall pay the remainder of said warrauts unpaid out of any money in the general fuud not otherwise appropriated.

SEC. 3. All persons having claims for work done or materials furnished under the provisions of "An Act to promote drainage," approved April 23, 1880, are authorized to present their claims to the State Board of Examiners. All claims so presented shall be itemized, and verified by the claimants, his heirs or assigns. The State Board of Examiners shall audit and allow said claims, either in whole or in part, or reject the whole, as they may deem just and proper, and certify the amount so allowed to the State Controller, who shall draw his warrant in favor of each claimant for the said amount upon the State Treasury. The State Treasurer is authorized and required to pay the same out of any money in the general fund not otherwise appropriated.

SEC. 4. The sum of $43,108.26 in the State Treasury to the credit of the State drainage construction fund, and the sum of $21,048.75 in the State Treasury to the credit of the construction fund of Drainage District No. 1, and the sum of $190,000 in the State Treasury not otherwise appropriated, is hereby appropriated to pay the warrants mentioned in Section 1 of this Act, and those authorized to he drawn in Sections 2 and 3 of this Act.

SEC. 5. This Act shall he in force and take effect from and after its passage.

Comparative Safety in Mines.

The result of rather a curious competition among mines has just heen announced. Some ten years ago, in Belgium, a memher of the Association of Engineers from the school at Liege founded a prize to he awarded to the managers of the fiery colliery in which the least numher of deaths from explosion should take place in ten years. To this end, he gave the sum, of 5,000 francs, which, with the accumulated interest, now amounts to ahout 8,500 francs. To this sum the Government added 5,000 francs.

Last year a jury was appointed to decide the question and they have, after thorough investigation presented their report. The prize has now been presented, the fortunate colliery heing that of the Nord de Charleroi, No. 3 pit. The second prize was gained hy the Ougree, and the third hy the Grisenil collieries. In the awarding of this prize, the difficulties to he encountered in prosecuting the operations of mining were to be taken into account. The conditions of the competition excluded all pits in which fewer thau 250 men were employed in underground work. Ninety collieries entered the list as competitors, but only one-half of this number kept up the minimum number of underground hands. The deaths from explosion during the deccenial period were two for No. 1, four for No. 2, and nine for No. 3. These numhers gave per 1,000 men employed 0.59, 1.03, and 1.33 respectively. If we omit one of the competing collieries, that of Agrappe, in which the number of deaths was, chiefly in consequence of a very disastrous explosion, 269, the mean number of deaths from fire-damp explosion in the 43 pits during the period of ten years was 23.33; which gives a proportion of 2.48 per 1,000.

Mining Share Market.

There is little new to report concerning the stock market, and our tables show what slight fluctuations have occurred. According to the statements made to the *Enterprise* reporter by the officials of the middle Comstock mines, there should have been a rise in prices instead of a falling off, from the fact that the connection made on Thursday on tbe 3000 level of the Combination shaft is an important event, and gives great encouragement to the managers of tbe mines, who say that tbe ground just opened is of the most favorable nature, being mostly good-looking quartz. The Chollar ground is of a swelling character, but indicates good pay rock. Although the connection was made last Thursday, it will take several days to square up the drift and get ready for cross-cutting. The hydraulic pumps are working splendidly, and can run ten strokes a minute without any trouble. The circulation of air is good, and the work of exploration will begin as soon as possible. At the North End mines everytbing is going on about the same as usual, with the exception of extra men being employed at the Sierra Nevada in making repairs to machinery and putting a new foundation for the same. Work on the upper levels of the Sierra Nevada will be commenced as soon as the necessary repairs have been completed on the surface.

Bullion Shipments.

Alhambra Hill, February 5, $8,061; Wood River ore, 3, $2,184; Ontario, 3, $6,080; Christy, 3, $1,700; Queen of the Hills, 3, $1,800; Mayflower, 3, $1,850; Eureka, 3, $1,750; Crescent, 4, $3,130; Christy, 4, $1,800; Ontario, 4, $21,714; Stormont, 5, $2,680; Crescent, 5, $2,900; Eureka, 6, 1,000; Stormont, 6, $3,200; Vienna, 6, $2,000; Christy, 6, $2,894; Ontario, 7, $14,750; Minnie Moore, 8, $1,490; Navajo, 9, $12,000. During the week ending February 7th there were shipped from Salt Lake 27 cars of ore, 732,010 pounds, and 15 cars bullion, 350,319 pounds, making a total of 42 cars, aggregating 1,082,329 pounds.

Partner Wanted in a Patent.

I have invented a valuable patent, which has been allowed in the U. S., and want to secure partners to take out patents in foreign countries on reasonable terms, Write to or call on J. PETTINGER, International Hotel. San Francisco, Cal.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING FEBRUARY 3, 1885.

311,462.—FIRE KINDLER—A. Archibald, Santa Maria, Cal.

311,465.—LAMP FILLING ATTACHMENT FOR OIL CANS—W. Bloomfield, S. F.

311,567.—DEAFENING FOR WALLS—L. E. Clawson, S. F.

311,725.—ELECTRICAL APPARATUS—J. D. Culp, San Felipe, Cal.

311,584.—RULE GAGE—Hunt & Bressler, Crescent City, Cal.

311,594.—WATER WHEEL VALVE GEAR—I. Lepley, Amador, Cal.

311,607.—RAILWAY CROSSING ALARM—J. T. Pritchard, Carson, Nev.

311,787.—GATE LATCH—A. G. Rockfellow, Ashland, Or.

311,690.—CANISTER—C. M. Symonds, S. F.

311,693.—INSERTIBLE SAWTOOTH—J. C. Trullinger Astoria, Or.

311,615.—EYEGLASSES OR SPECTACLES—Chas. Slotterbek, Lakeport, Cal.

311,547.—DYNAMO ELECTRIC MACHINE—F. S. Waterhouse, Sacramento.

311,705.—THRASHER—David Young, Stockton, Cal.

NOTE.—Copies, of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewoy & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEAFENING OR FILLING FOR WALLS.—Leonard E. Clawson, S. F. No. 311,567. Dated Feb. 3, 1885. This is a filling or deafening for walls and partitions, and it consists of a filling and a means for introducing it between the studding. The usual manner of filling the spaces between the studding of partitions or walls, for the purpose of deafening and preventing sounds from passing, is by means of detached bricks or blocks of any suitable material. These blocks must be laid up by a mason or bricklayer, at a considerable expense, and some waste of material. Mortar is sometimes used between floors, but in such cases a supplemental permanent floor is laid, which is a conductor of sound. Mr. Clawson forms his filling in a plastic state, molding it in the place where it is to be used, and then entirely removing the molds.

EYEGLASSES.—Chas. Slotterbek, Lakeport, Lake Co. No. 311,615. Dated Feb. 3, 1885. This improvement consists of a perforated opaque diapbragm, which is substituted for a small section of citber lens of an ordinary spectacle or eyeglass. The invention is specially useful as an aid to persons whose sight has become defective, and acts as a collimator in enabling them to take sight eitber in sbooting a gun or in the use of surveying instruments, or for other similar purposes. It cuts off all diffused light, rnd permits only a direct ray to enter, thus enabling the operator to draw an accurate line of collimation through the sights of an orginary rifle, even though he may suffer from the defective convexity of the eye. It leaves tbe view unimpeded when its use is not necessary, so tbat a person using glasses will use them in the ordinary manner witbout any interference by the opaque portion.

VALVE GEAR FOR HIGH SPEED WATER-WHEELS.—Isaac Lepley, Amador Ci y, Amador county. No. 311,591. Dated Feb. 3, 1885. This invention relates to a mecbanism for opening and closing valves in tbe supply-pipes of water wheels which are driven by the momentum of a column of water under a high head; and it consists of a plunger conneated with the water-gate stem, and baving its ends fitted to work in two cylinders placed opposite to each other; pipes leading to them from a supply-valve cbamber to furnisb wates, by which tbe plunger is moved to open or close the gate, and a single lever operating between disks upon a shaft; and having panels and rods so arranged that either disk may be turned and its connecting mechanism operated to open its gate and drive the wheel in either direction. Certain details of construction are also covered by the patent.

AUTOMATIC ALARM FOR RAILROAD CROSSINGS.—Jno. T. Pritchard, Carson, Nev. No. 311,607. Dated Feb. 3, 1885. This is a device for giving a signal or alarm from the train, whenever a crossing is approacbed, or at any otber desired time, and it consists of a mecbanism connected with the bell and whistle of tbc locomotive, by whicb tbey may be sounded, and a means for operating tbis mecbanism at auy desired point. The mecbanism is operated from tbe road-bed, by light supplemental wheels, under the pilot, coming in contact witb a central rail or timber, tbese wbeels operating suitable levers connected with the wbistle and bell. Tho device is quite simplo in operation.

Inventors and Patentsss

Are referred to the notice of L. Peterson in our advertising columns. He has for ten years been successfully engaged in making models and otherwise assisting inventors, patentees, and others in completing inventions, new mechanical designs, machinery, etc. Write to him for any further information.

Market Reports.

Lumbar at Wholesals.

There is a fair demand for lumber, but no special changes in price. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH.—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $15.

PICKETS.—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER.—No. 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $39; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, but, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC.—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 1 Rustic, 1x8, $26; No. 5 refuse) do do, $21.

CLEAR.—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2 do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED.—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED.—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and ¼x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR.—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for antici ated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates—Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.20; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumbsr at Rstall.

Retail quotations for pine, fir and spruce are as follows:

ROUGH MERCHANTABLE.—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱ M ft, $33.50; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $29.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.50; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1-¼inch, ₱ M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

Retail quotations of Redwood are as follows:

ROUGH MERCHANTABLE—₱ M ft, $22.50; do Selected, $27.50; do No. 2, $18.50; Surface, No. 1 and Rough Clear, $40; do, 1x6, $37.50; do, No. 2, $30; Rustic, No. 1, 1x8, $37.50; do, No. 1, 1x10, $40; do, No. 2, $35; do, under 10 ft, $35; T and G Redwood, 1x4, 1¼x4 and 1¼x6, $40; do do, 6 inch, 12 ft and over, $37.50; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; do do do, No. 2, $30; do do, Beaded, 12 ft and over, $40; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; Half inch Surface, $22.50; Pickets, Fancy, $30; do, Rough, pointed, $20; do do, square, $17.50; Siding, ½-inch, $27.50; Battens, ½-inch, per lineal ft, 1c; Shingles, ₱ M, $2.50; Shakes, Split, $11; do, Sawed, $12; Posts, per piece, 13c; Dressed Boards, ₱ M ft, $25.

On a credit of 60 days or less, or a discount of two (2) per cent for cash only. On all credits exceeding 60 days' time, not less than one (1) per cent per month to be added.

Under the rules of the Exchange, no "lump" sum will be given on any bill of lumber.

Nails.

We give the price list of the Pacific Iron and Nail Company:

FENCE AND BRAD.—10d to 00d, $2.90: 8d and 9d, $3.0?; 6d and 7d, $3.25 4d and 5d, $3.50; 3d, $4.25; 2d, $5.50.

BARRELS.—¾ inch, $6.75; ⅞ inch, $5.75; 1 inch, $5.25; 1½ inch, $4.50; 1¾ inch, $4.25; 1⅞ inch, $3.75; 1½ inch, $3.50.

LINING.—¾ inch, $7.25; ⅞ inch, $8.75.

TOBACCO.—10d, $3.25 8d, $3.50; 6d to 7d, $3.75.

CLINCH.—6d to 30d, $4.50.

SLATING.—5d, $3.75; 4d, $3.75; 3d, $4.50; 2d, $6.75.

FINISHING.—2d, 1 inch, $3.75; 3d, 1¼ inch, $6.75; 4d, 1½ to 1¾ inch, $4.50; 6d, 2 inch, $4.25; 8d, 2½ inch, $4.00; 10d, inch and over, $3.75.

CASING AND BOX.—10d to 30d, $3.50; 8d, $3.75; 6d, $8.00; 4d, $4.25; 3d, $5.25.

FINE BRAD.—4d, $4.50; 3d, $5.75; 2d, $6.50.

CUT SPIKES.—All sizes, $3.00.

BOAT SPIKES.—All sizes, $3.50.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Material.

Lime, per barrel, $1.50@$1.60. Plaster, $2.75-3.00. Eastern Plaster, $3.00-3.25. Rosendale Cement, $2.25-2.75. Portland Cement, $3.50-3.75. Fire Brick, per 1,000, $40 @ $45, according to brand; hard, $10.00@$12,00; red, $8.00@$8.50; soft, $7.50; face, $30.00.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—San Benito and Monterey Countics.
GEO. MCDOWELL—Santa Clara County.
O. W. INGALLS—Arizona.
M. S. PRIME—Alameda County.
Mrs. ORIER—Humboldt County.
E. G. NORTNER, Sacramento County.
W. H. H. HUSSEY—Contra Costa County.
E. L. HUNT—Lake County.
C. M. CARR—Oakland.

ENGRAVINGS FOR SALE.—Electrotypes of many of the engravings in this paper can be had (within a reasonable length of time after their appearance in our columns) on favorable terms, for job, book or newspaper printing.

A $3.50 Premium for $1 to Subscribers of this Paper.

Picturesque Californian Homes.

A VOLUME OF

Forty Plates, Plans, Details and Specifications of Houses.

Costing from $700 to $15,000, and adapted to Families having Good Tasts and Moderate Means.

CITY AND COUNTRY HOMES.

This work is designed to meet the wants of that large number of persons who have but a limited amount of money at their command, and in building a home wish to use it to the best advantage. Drawn by Samuel and Joseph C. Newsom, Architects, San Francisco, who have taken much pains in its preparation, and confidently assert that mechanics, clerks, salaried men, workingmen of every calling contemplating building, carpenters and builders in cities, towns and villages, will find this book a useful aid, worth many times its cost in the information and practical suggestions which it gives.

DESCRIPTION OF PLATES:

Estimated Cost Complete.

PLATE 1.—Modern House of 8 rooms and laundry in basement, elegant and spacious staircase, hard wood mantels, brick foundation, electric bells and speaking tubes, modern improvements.....$4,500

PLATE 2.—One story and three-quarter Picturesque Cottage, with observatory, suitable for elevated lot, 14 rooms..... 5,500

PLATE 3.—Picturesque Cottage of 7 rooms and bath 3,750

PLATE 4.—Residence now building at 16th and Union Sts, Oakland, Alameda Co., Cal. (S. Davisson, Esq., owner)..... 3,500

PLATE 5.—City Residence of 9 rooms, Queen Anne style..... 5,000

PLATE 6.—Residence, 9 rooms and bath, built on Capp and 22d Sts., San Francisco. (C. Evans, owner)..... 4,500

PLATE 7.—City Residence of 8 rooms and bath..... 3,800

PLATE 8.—Hardwood Mantels, with tile hearths and facings, suitable for dining and sitting rooms and parlors..... ——

PLATE 9.—Cottage of 6 rooms and bath room, wooden mantels..... 3,000

PLATE 10.—Plans and Elevation of a 4-room and bath cottage..... 950

Plan and Elevation of 3-room Cottage, bath in kitchen..... 700

PLATE 11.—Residence 11 rooms, picturesque..... 8,000

PLATE 12.—Dwelling of 7 rooms, laundry and bath room, now building at Eureka, Humboldt Co., Cal. 3,500

PLATE 13.—Plans, Elevations and Details of a Cottage of 5 rooms, observatory and bath; laundry and wood and coal room in basement; brick foundation; cathedral glass, etc..... 2,750

PLATE 14.—Residence built at Eureka, Humboldt Co., Cal. (D. A. Boyd, owner)..... 3,000

PLATE 35.—Residence of C. Hirshfeld, Esq., on north side of California, bet. Pierce and Scott, 10 rooms and bath..... 5,500

The Plans are clear, and finely drawn on Lithograph Plates, and handsomely printed; size, 9x13 inches.

Subscribers to this paper (old or new), who pay one year in advance of the date of application for this premium, can have the same by paying $1 additional. Sent by express, unpaid, or on receipt of $1.10 post paid.

Our Improvements.

The various departments of our somewhat extensive business have long been carried on in different localities. But we have lately adopted plans whereby we expect within a few weeks to bring all under one roof, at No. 252 Market street. To do this our editorial rooms, composing and press rooms, located at No. 414 Clay street since Aug. 8, 1868, will have to be removed. In preparation for this, an expensive excavation, extending below the water line, has been made under the sidewalk adjoining our frontage on Front street, in which our large steam press will be placed, and thereafter propelled by an eight horse-power gas engine. The same power will operate the machinery for stitching and trimming our paper and operating the elevator directly connecting our press, folding and mailing rooms with our composing, business and patent offices on the fourth floor.

The entire outlay by the proprietors of this office, in effecting these substantial improvements, will amount to several thousand dollars. It is believed that the consolidation of their business in more convenient, commodious and pleasant quarters will render their work more effective and prove a lasting benefit to their patrons generally, when fairly settled down again in all departments.

Here let us say, both cheerfully and hopefully, to our numerous and considerate patrons, that their prompt financial favors can hardly come at a better season to be appreciated. We hope that all who can will renew their expired and expiring subscriptions. And may we not add, also, try and influence many of their new and old neighbors to subscribe for the paper that is faithfully doing its very best for their interests and the welfare of the community throughout its field of labor? You can have the reasons mentioned, with the argument that we intend to issue an improved and more valuable publication than ever before.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent

ASSESSMENT NOTICE.

Fremont Mining and Milling Company.—Location of principal place of business, S n Francisco, Cal. Location of works, Amador county, near Drytown, Cal.

NOTICE is hereby given that at a meeting of the Trustees, held on the twenty ninth day of December, 1884, an assessment (No. 1) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 402 Front street, room 8, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourth day of February, 1885, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday the twenty-seventh day of February, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

MARK T. ASHBY, Sec'y.

OFFICE—No. 402 Front St., Room 8, San Francisco, Cal.

By order of Board of Directors, delinquency under above assessment is postponed to Wednesday, February 25, 1885, and the day of sale is postponed to Friday, March 20, 1885.

MARK T. ASHBY, Secretary.

THE JENKINS STANDARD PACKING

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

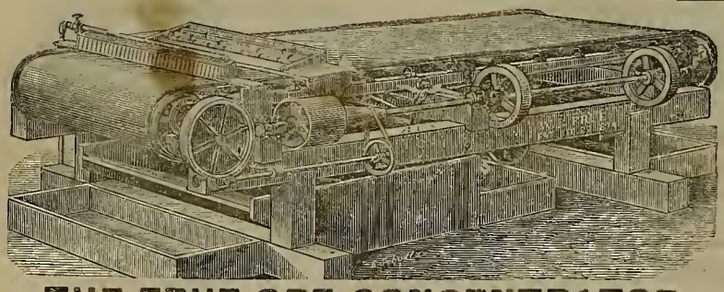
IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.

Manufactured only by

JENKINS BROS., 71 John St., New York.

C Hendel Jan 24 '85

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

....BUILDERS OF....
MINING MACHINERY.

San Francisco:	Chicago:	New York:
127 First Street.	100 N. Clinton.	145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of **LATEST DESIGN** and **MOST IMPROVED** construction. We offer our customers the **BEST RESULTS OF 35 YEARS' EXPERIENCE** in this **SPECIAL LINE** of work, and are **PREPARED** to furnish from **SAN FRANCISCO** or **CHICAGO,** the **MOST APPROVED** character of **MINING AND REDUCTION MACHINERY,** adapted to all grades of ores and **SUPERIOR** to that of any other make, at the **LOWEST POSSIBLE PRICES.**

We are also prepared to **CONSTRUCT** and **DELIVER** in **COMPLETE RUNNING ORDER,** in any locality, **MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC.,** of any **DESIRED CAPACITY.**

WATER JACKET SMELTING FURNACES

For **COPPER** and **ARGENTIFEROUS LEAD** ores of **NEW** and **ORIGINAL DESIGNS,** covered by **LETTERS PATENT.** No other Furnace **CAN COMPARE** with these for **DURABILITY,** and in **CAPACITY** for uninterrupted work. **MORE THAN 150** of them are now **RUNNING** in various parts of **THIS COUNTRY,** as well as many in **FOREIGN COUNTRIES,** giving results **NEVER BEFORE ATTAINED** as regards **CONTINUOUS** running, **ECONOMY** of fuel, **AMOUNT** and **QUALITY** of **BULLION** produced. These **CLAIMS** have been **PROVEN BY RESULTS** in **ANY NUMBER** of **INSTANCES,** and the **GREAT SUPERIORITY** of this **SYSTEM** of smelting ores **DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS** furnished to order of any **CAPACITY,** with **ALL IMPROVEMENTS** that experience has **DEMONSTRATED** as **VALUABLE** in this class of work.

WATER JACKET SMELTING FURNACES

THE DUNCAN CONCENTRATOR

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been **THOROUGHLY TESTED** for the past **TWO YEARS,** under a **GREAT VARIETY** of **CONDITIONS,** giving most **EXTRAORDINARY** results **FAR IN ADVANCE** of anything **EVER BEFORE REALIZED.** A recent **COMPETITIVE TEST** at the Carlisle Mine in Mexico, showed an **ADVANTAGE OF OVER 30 PER CENT** in favor of **THE DUNCAN.** The amount **SAVED OVER THE FRUE** being sufficient to **PAY THE ENTIRE COST** of the machines **EVERY MONTH OF THE YEAR.** One of its **MOST VALUABLE** features is as an **AMALGAMATOR.** It saves all **THE AMALGAM GOLD** and **SILVER** that **ESCAPES** the **BATTERIES, PANS** or **SETTLERS,** making the machine worth **MORE** than **ITS COST** for **THIS PURPOSE ALONE.**

HOISTING WORKS

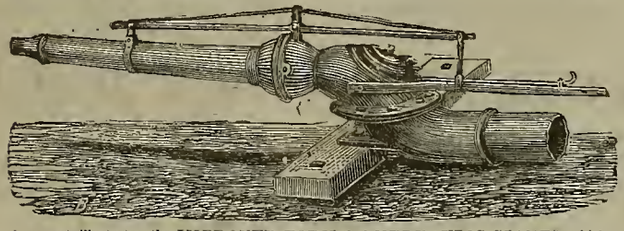
Of late and improved design with all known appliances for safety and efficiency to work to any depth and of any desired capacity. Complete shaft equipment, such as safety cages, landing dogs, cars, turn-tables, ore and water buckets, skips, etc., etc., for either vertical or incline shafts.

PUMPING MACHINERY

Adapted to all Requirements.

HOISTING WORKS

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS,** which we manufacture. All other styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

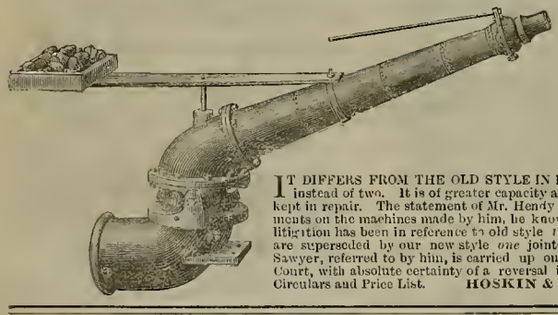
E. G. DENNISTON, Proprietor.



THE CUT REPRESENTS OUR

IMPROVED

HYDRAULIC

MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that *all* styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. ☞Send for Circulars and Price List. **HOSKIN & CO., Marysville, Cal.**

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

VOLUME XLXX Number 8.

Taylor's New Rock Crusher.

Mr. H. R. Taylor, of this city, has invented a new form of rock-crusher which he calls the "Patent Rock Fine Crusher" for assayers' samples, working specimen ores, crushing old crucibles, etc. The design of this small machine is to enable a person quickly and easily to bring to fine powder the hardest ores, to be assayed, sampled or worked. The machine is represented in the engravings, Fig. 1 showing a general view of the apparatus, and Fig. 2 the lever, toggles, etc.

Both jaws are faced with hard, white iron, the lower parts of which are plain surfaces, between which the ore is crushed fine. The stationary jaw B has its lower plain surface at an angle to the upper or corrugated surface. The lower part of this jaw is adjusted by screws, to crush fine or coarse. The movable jaw C is operated by the hand lever A, jaws, links and toggles, as shown at Fig. 2. The jaw C has its corrugations horizontal to facilitate the forcing the ore down at each stroke of the lever. This jaw has a vertical and a horizontal motion, the link E forcing the plain part of jaw C forward with great force, at each downward stroke.

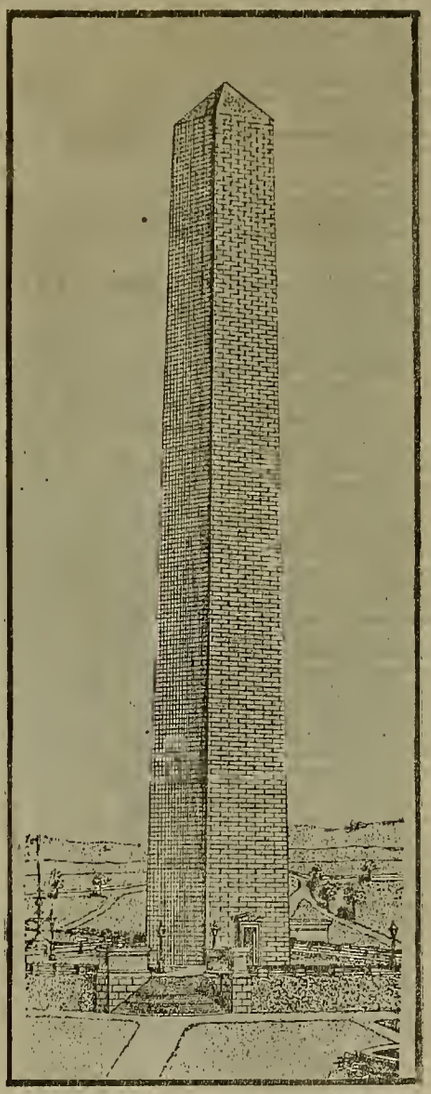
The whole can be quickly taken apart for cleaning, after each lot is worked. To do this, raise the lever A as in Fig. 2, and with the tapering drift drive out pin G (upon which lever A turns), then the lever can be thrown over, and jaw B removed, and all dusted clean with the brush. To restore the parts to position again, replace the jaw B, bring back the lever and insert the pointed drift, and with the pin or fulcrum G drive out the drift, and all is ready and clean for the next crushing.

The lever has a rubber covering where grasped by the hand, and a rubber cushion where it strikes the bed-piece, to prevent jar and noise. There is a star-shaped piece on top of the lever (not shown), by the turning of which the hight to which the lever can be raised is regulated; and when the lever is raised as in Fig. 2, this star-shaped piece is turned half around.

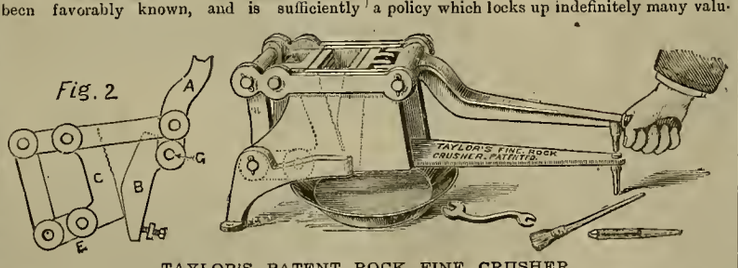
Each machine has a cover (not shown) to prevent pieces of ore from flying out, and is furnished with a wrench, drift-pin and dust-brush. It weighs complete 85 pounds and costs $25. The engraving shows the hand size, but larger crushers, to be used by power, can be made on the same plan. The device is really practical and useful, and accomplishes work easily and with great rapidity. John Taylor & Co., dealers in assayers' materials, mine and mill supplies, 112 to 120 Pine street, in this city, have them for sale. For prospectors' purposes, working specimen ores, and crushing small batches of rock they are excellent. The ore is crushed very fine indeed and with little expenditure of power, the system of toggles, etc., giving great leverage. Although just introduced on the market the crushers are meeting with very ready sale.

The strangest thing in connection with the silver question is that many of the Eastern capitalists who favor the suspension of silver coinage and a reduction of the tariff on lead are heavy owners of Western railway stocks. Cripple the silver and lead interests of the country, and where is there a railroad west of the Rocky mountains that would pay its running expenses?

The Grizzly Quartz Mine.—We understand that the Grizzly lode, which adjoins the famous Alaska mine of Sierra county, is offered for sale, but at a figure we can hardly believe to be correctly stated, as the mine has long been favorably known, and is sufficiently opened by shaft and tunnel to prove its character and value. It is to be regretted that the owner, formerly of Sierra, is debarred by business elsewhere from actively exploiting a lode which—if some of our quartz experts misjudge not—is likely to prove as rich a gold repository as the Alaska, the Four Hills or the Rainbow. The Grizzly is in charge of Mr. Thomas Phillips, of Pike City, and the work thereupon is restricted to the required annual expenditure, a policy which locks up indefinitely many valuable mines. We trust all such properties now held by parties unwilling or unable to fully work them may speedily pass into more enterprising hands, and thereby add additional wealth to the locality where they are situated.



THE WASHINGTON NATIONAL MONUMENT.—(See page 125.)



TAYLOR'S PATENT ROCK FINE CRUSHER.

Lucine District.

We had a conversation a few days since with a miner from Lucine District, on the borders of Nevada and Utah. The most of the mines are in Box Elder county, Utah, about six miles south from Tacoma Station, C. P. R. R. The district was discovered in 1868. After the first boom not much work has been done until recently. A number of men have gone to work there of late opening claims, and have been shipping ore to the Salt Lake market. The ore is silver-lead, running from 25 to 65 ounces of silver and 25 to 50 per cent of lead.

The place was originally opened as a copper camp years ago, and the surface indications were very good indeed. The copper ledges are very large, some of them being from 100 to 150 feet wide. While the old Tacoma mine was running there was great interest in the camp, and some 10,000 tons of ore were shipped. This mine belongs to New York owners and is not now worked. Recently some Salt Lake capitalists have come into the camp, and will in the spring open it up. Some of the copper properties have been purchased by them. The ore has to be hauled by teams to the railroad, and then shipped to the smelters at Salt Lake for reduction. Ore is now sent that way, sampled, and sold to the highest bidder. The gangue in which the mineral is found carries a good percentage of iron, which makes the ores flux easily, and the ore brings good prices in consequence at the smelters. Quite a number of men intend going to the camp in the spring to open up and work the mines. Part of the claims are in the State of Nevada and part in Utah Territory.

California Minerals for New Orleans.

As stated in last week's Press, a portion of the money given by the Legislature towards securing a good representation of California products at the New Orleans Exposition will be expended in displaying a mineral collection. The State has an extensive collection at the State Mining Bureau, but there were some legal objections to its removal until the Legislature adopted a concurrent resolution by which the State Mineralogist is "authorized and directed" to select from the collections in his charge such specimens as in his judgment will best represent the mineral wealth of the State and take them to New Orleans, there to be exhibited for as long a time as he may see fit.

Having this permission, Mr. Hanks, State Mineralogist, is selecting and packing a collection of specimens for shipment, and on or about the 1st of March will leave for New Orleans with the minerals. It is unfortunate that the Bureau has no fine gold ore specimens, the best of them having been stolen some time since. The Mineralogist has, however, written to the leading mines, asking for about 200 pounds of ordinary working ore. These specimens will be forwarded direct to New Orleans, and will form a very characteristic feature of the Exposition. These specimens of low-grade ore will be presented to Louisiana to form a part of the permanent exhibition in the Exposition buildings. The Mining Bureau will remain open as usual while the Mineralogist is absent.

The location of a claim should be followed at once by recording it. This often saves trouble.

CORRESPONDENCE.

We admit, uneudorsed, opinions of correspondents.—EDS

Trinity County Mines.

EDITORS PRESS:—I thought possihly you might like to hear of the mining outlook around here. The McDonald mine is yielding the usual amount of ore and the stopes never looked hetter. All the other mines are in the same condition. I need not mention them in detail as I have deecribed them already through your columns. A rich strike has recently heen made here hy Mr. Myres, who has heen working driving tunnels through his claim for the past five years. He has struck a rich ledge which averages four feet in width, and when worked at the mill yielded $150 per ton. It is in French Gulch mining district, on the south fork and in the same range as the Shafter mine, which was recently hought by William T. Coleman & Co. So much for this district. I have received several communications of late from my hrother miners in Nevada and Arizona asking me what I thought ahout New River, and as your journal has a wide-spread circulation among the mining element, on account of the bold standpoint it has taken in regard to legitimate mining, I thought I would give them my opinion of it through the PRESS. In reply to them I will state that I have not heen there, hut a friend of mine who is a thorough, practical miner went there to examine it closely. His statement in regard to it is this (which I know to be true): There are a few small lodges discovered, which would work about $30 per ton, and the miners instead of developiog them ask fabuloue prices for their find.

There are also miners coming hack from there every day and staying at our camp who verify the above statement—meu whom I know to he trustworthy. So I would warn all miners who want to come to New River in quest of employment to stay away from there, as there are only five men working for wages in the camp just now. This does not apply hy any means to prospectors, as I know enough ahout the country to state that there is an immense range of country to prospect along the north fork, and no doubt good mines will be discovered there, for aloog its streams it yielded placer gold in ahundance, and just the right formatiou to find minee in porphyry and slate. Your correspondent mentions these matters to show up things in their true light; not helieving in perpetrating a gross fraud upon a crowd of miners, gotten up by railroad and steamhoat companies and a few saloon-keepers and hotel men along the route who are like Dickens' Micawber, "waiting for something to turn up." Also another class who are a pest to this country are the would-he experts who come around miners, say they are representing capital, and are simply a nuisance; who claim they were educated iu Frieburg and speak very had English. I would advise all miners to keep away from them, for nearly all of them don't know a piece of quartz from a grindstone.

In conclusion, I again tell the miners who are looking for work not to come here, as there is an overplus of miners in this county already.

P. F. MCCARTHY.

Deadwood, Trinity Co., Cal.

THE PIONEER MINE SUIT.—A long and elahorate decision has been rendered hy Judges Sawyer and Sabin in the case of the Pioneer Gold Mining Company vs. Benjamin F. Baker. The suit was hrought in 1883 in the Superior Court of Sierra county to establish a right to redeem the Pioneer mine, situated in that county, under an alleged mortgage said to have heen created aud effected hy virtue of certain contracts and sales. Baker was the origioal owner of the mine, and sold the same to the plaintiffs in consideration of $112,500 cash, and the remainder, making up the whole amount, $255,000, was to he paid from the profits of the mine. These notes formed the alleged mortgage, hut as the mine failed to "pan out" as well as expected they were unpaid, and Baker, who acted as Superintendent, took it upon himself to hold possession of the mine. This caused the action at law. In the decision, which is an interlocutory one, the right of the plaiutiffs to the mine is upheld, and their right to work the same conceded. It was therefore ordered that a preliminary decree he entered in favor of plaintiffs, and the case he referred to the standing master in chancery of the Court hetween the parties and report the same to the Court.

STILL REMAINING.—There appears to be a let-up in the exodus from the Comstock. The passenger traffic on the Virginia and Truckee Railroad for the last month has heen very light, and hut very few people have left here, which shows that confidence is revived in the men who a few months ago thought the Comstock was played out. It will he a long time hefore the Comstock reaches bed-rock, although at present times are a little dull —*Virginia Enterprise.*

A DISPATCH from Daggett, San Bernardiuo county, says: Messrs. Waterman & Porter, of the Waterman mines, have purchased a one-half interest in the Sue mine, and will commence the erection of a 15-stamp mill at that place. The combination is to he known as the Sue Mill and Mining Company.

Determination of Phosphorus.

Josef Westesson, chemist of the Chester Rolling Mills, Thurlow, Pa., read hefore the American Institute of Mining Engineers at a recent meeting the following paper:

No question in the metallurgical chemistry of the present day seems to he so difficult to agree upon as the determination of phosphorus in iron and eteel. To my knowledge, there are at present at least three different methods in use in the iron lahoratories of the United States, viz.: The citric acid method, the molyhdate-magnesia method, and the direct molybdate method—the last named method having heen lately adopted. Each of these methods has its advocates, who take every pains to prove its advantages and the incorrectness of the others; and much has heen written for the purpose of securing the use of a standard method, as yet, however without any result.

There is no douht, or ought to he none, that each of these methods gives correct results when it is carefully conducted and every precaution taken. But it is not only correct results that we want uowadays. The demand is great, also, for getting results in the shortest possible time. I think it has heen sufficiently proved that the direct molyhdate method, the weighing of the precipitate, answers well in both respects. Being a pupil of Prof. Eggertz, I have myself used his method for years until quite recently, as it is described by Mr. Troilius in our "Transactions," Vol. X, p. 166 (hut with some slight modifications), and I can safely say that the results of this method agree well with those of the molybdate-magnesia method. I have, moreover, heen checked in a few instances by some of the leading chemists of the country, and their results have been such as to commend the method I use.

On the European continent, and also in England, the molybdate method is almost exclusively in use. Therefore, the question is there not so much ahout the superiority of different methods; researches and experiments tend more to improve the method generally adopted. An important step in this direction has been taken hy Dr. Adolph Tamm, of Stockholm, Sweden, whose paper on the subject is puhlished in the *Jernkontorets Annaler* of 1883, under the title, "Concerning Different Ways of Dissolving Iron for the Determination of Phosphorus hy Means of Ammonia-Molyhdate." The principal contents of this paper are suhstantially given helow.

When iron is dissolved in nitric acid the solution acquires a brownish- color from humic acids, originating from the carbon in the iron. These humic acids are not destroyed hy evaporating the solution to dryness at 212°, or on a water-bath, hut continue to give the brownish color after redissolviug iu nitric acid. The color would, of course, be of uo consequence if experiments had not shown that the humic acids, tbe presence of which it indicates, prevent the complete precipitation of phosphorus. That such is the case seems to he clearly proved by the facts that the silica and graphite, filtered off from the solution, show no presence of phosphorus; that the filtrate, after a new addition of molyhdate and boiling, remains perfectly clear; and finally, that the method which Dr. Tamm recommends gives considerably higher results. This method, which he has worked with great satisfaction, and the correctness of which he has confirmed by the magnesia method, is the following:

Dissolve 1 gramme of iron in 12 c.c. of nitric acid (1.2 sp. gr.), and hoil on a cast-iron plate down to dryness. Let the beaker remain on the hottest part of the plate—usually at least 200° C.—an hour. Redissolve in strong hydrochloric acid, hoil down again to dryness, and let the heaker remain another hour on the hottest place—the second evaporation to dryness for complete separation of silica. Again dissolve in strong hydrochloric acid aud remove the excess of acid through evaporation; add 5 c.c. of water, filter, and add the ammonia-molyhdate.

The following table, given hy Dr. Tamm, will show the results of hoth methods. It is to he observed that the higher the amount of phosphorus in an iron, the greater the difference in the results. The old method is marked B, the new method A:

	Per cent of phosphorus according to	
	A	B
Pig-iron	.019	.013
Pig-iron	.021	.016
Wrought-iron	.023	.015
Pig-iron	.024	.015
Pig-iron	.024	.016
Pig-iron	.024	.016
Bessemer steel	.026	.018
Pig-iron	.026	.015
Pig-iron	.026	.017
Pig-iron	.027	.020
Bessemer steel	.027	.019
Bessemer steel	.027	.019
Bessemer steel	.028	.018
Bessemer steel	.028	.019
Pig-iron	.029	.019
Bessemer steel	.030	.020
Pig-iron	.065	.045
Pig-iron	.077	.053
Pig-iron	.078	.055
Wrought-iron	.109	.080
Pig-iron	.212	.135
Pig-iron	.222	.141
Iron rail	.391	.353
Pig-iron	.410	.260
Iron rail	.541	.433

That the results obtained by the molyhdate method, as it is generally worked, should, according to Dr. Tamm's revelations, be inaccurate to so great an extent, is a very discouraging fact; and the only thing that can console the practitioners of that method is, that the molyhdate-magnesia chemists are making the same errors. There are chemists whom I havs made acquainted with Dr. Tamm'e method who helieve etill less in this method than the old one, and, I dare say, it will he some time hefore they become convinced. The frequent remark that the yellow precipitate is soluhle in hydrochloric acid will, in this case, he hest disposed of hy the words of Fresenius: "The presence of molyhdate of ammonia alters the precipitate's deportment to acids; *only large excess of hydrochloric acid prevents complete precipitation.*" Therefore, the excese of said acid must he removed hefore adding molyhdate. Some hold that the orthophosphoric acid is transformed into pyrophosphoric acid through heating to 200° C. This is true, hut they forget that hoiling the dried mass in hydrochloric acid hrings the pyrophosphoric acid hack into the orthophosphoric state. Taken altogether, the objections do not hold good, even if we admit that a trace of molybdic acid eometimes is precipitated along with the yellow precipitate, which, of course, will uot have any influence on the final result, this being only 1.63 per cent of the precipitate. A very essential advantage of this method is, that results can be obtaiued in less than five hours.

I give helow a table of results ohtained hy myself in the use of both methods. A and B mean the same as in Dr. T.'s tahle. The precipitates ohtained in method A have heen redissolved and precipitated with manganese solution:

	Per cent of phosphorus according to

Notes on the Patio Process.

The followiog paper was read before the American Institute of Mining Engineers, by C. A. Stetefeldt, New York City: The *hacienda* Sauceda is one of the largest and finest *haciendas* in the vicinity of the City of Zacatecas, Mexico, and is said to reduce ores by the Patio procees more cheaply than any other establishment. It receivcs its supply of ore from the San Acacio miue. This mine has heen for some time, like most of the Zacatecas mines, out of bonanza, and yields, at present, ore of rather low grade. The silver occurs principally as silver-glance, ruby-silver and native silver, associated with pyrites of iron and copper, and some galena and zinc-hlende, io a gangue of pure quartz, which takes the form of amythyst whenever the ore is of high grade. All the ore, as it comes from the mine, is broken hy hand into small pieces, and sorted hefore it is delivered to the *hacienda*. Here it is firet crushed dry in Chili mills, and then ground wet in arrastras to an impalpable powder. The sulphurets not decomposed in the patio process are separated in the settlers from the tailings and concentrated by hand. By roasting them in a reverberatory furnace with carbonate copper-ores, "magistral" is obtained. All machinery is driven hy mule-power.

In the year 1883, the *hacienda* Sauceda reduced 17.726 tons of ore. The average value of the ore was 17.11 oz. silver per ton. Of this, 4.37 oz. or 25.5 per cent were lost. The loss in quicksilver was 1 pound per 7.4 oz. silver extracted. The total expenses of reduction were $8.12, Mexican money, per ton of ore distributed as follows, viz:

Pulverizing in Chili mills	$1.03
Grinding in arrastras	2.06
Salt, from 5 to 6 per cent	1.13
Magistral	0 80
Quicksilver, 1.71 pounds	0.90
Other items and general expenses	2.14
Total	$8.12

In considering these results by themselves, as far as the percentage of silver extracted is concerned, one would get an entirely wrong view regarding the perfec ion of the patio process. It seems that the loss in silver is a more or less constaot quantity per ton of ore; *i. e.* it is about the same for poor and for rich ores, whereby the percentage of silver extracted from the latter becomes remarkahly high. The following statistics, taken from the hooks, will illustrate this.

Assay-value of ore. Oz. silver per ton.	Percentage of silver lost.
32.22	10.0 per cent.
37.00	10.0 " "
42.60	6.1 " "
47.60	5.6 " "
99.60	7.0 " "

These figures are rather a disappointment to those who helieve that they can improve the reduction of certain ores in Mexico hy the introduction of modern methods. Of course there are many ores that will not yield a high percentage of silver in the patio process.

The same is to he said about the cost of reduction. Modern methods mean the replacing of mule-power by steam-power. In districts void of fuel, like Zacatecas, this is a serioue question. So far, the Mexican Central R. R. has not estahlished freight rates sufficiently low to permit the importation of coal, and it would he a risky undertaking for any mining company to rely upon a temporary concession as long as there is no competition. On the other hand, the cost of the patio process depends largely upon the price of corn. When, in dry years, the crops fail, the price of corn may be four times as high as in normal years. The estimates ahove are hased upon normal prices of corn.

The Famous Allison Ranch Mine.

There was some talk a few months ago, says the Foothill *Tidings*, ahout the Allison Ranch mine being again worked. That the paying ledge, within the houndaries of that mine, has not been exhausted is the general opinion of all who know anything ahout mining and about the Allisou Ranch mine. This tact that the ledge has only heen "just a little prospected" insures that the old ranch will again he worked, hut that event may be distant in the future, as the present owners are very wealthy and have no pressing and present need of the gold in the Allison Ranch ground. A short sketch of the start of the mine may not he out of place in these columns.

The Allison Ranch mine is located down Wolf creek, ahout two and a half or three miles below Grass Valley. It takes ite name from a man named Allison, who used to raise cahbages, meions and other garden truck just over the ledge, and from which ledge over $3,000,000 worth of gold has heen taken. No douht Mr. Allison, in his garden days, could and would have conscientiously eworn that his ranch was much more valuahle for agricultural than for mining purposes. The ranch will grow cahhages and fruit trees of all kiuds at this day, and there is still gold to millions of value at a few hundred feet in depth.

In 1852 John and William Daniels, with a company of four others (all Missourians), worked iu Wolf creek at Allison ranch, and with long toms and cradles were gettiog out the gold from the gravel of the creek bed. The four Missourians, who were the partners of the Daniels brothers, became tired and went hack to their old home, and their names are not known in this part of the couutry. In 1853, while digging a tail race, the famous Allisou Ranch ledge was struck, but no particular attention was paid to the find. The miners were hunting gold in gravel and did not care much for quartz.

In July, 1854, Michael Colbert and James Stanton bought into the creek claims, which were paying reasouably well. In that year William Daniels sold his interest, one-sixth, to James O'Donahue, getting for the interest the sum of $250. Soon after this transaction, the quartz ledge was again struck by the gravel minere while working near the upper end of the claim. At this point the gravel was very rich, but the fact excited no suspicion that the quartz ledge had anything to do with the richness of the gravel. Miners know more in these later days.

One day, in the fall of 1854, two of the partners, Colbert & Stanton, traced the ledge a short distance down the creek, hut they soon lost sight of it, and all the partners stopped for the day, excepting the two named. These took out ahout a ton of quartz in an afternoon, after the others had quit work. During the night there was a cave of their little pit, which covered the ledge and some of the quartz that had heen taken out. Wheu the winter's rains came and cleaned out the slickens io the creek, the quartz was uncovered and a ton and a half of it was taken out and takeu to Lee & Simpson's mill, a mile below the ranch, and there crushed, and the yield was about $375, although some say $600 was realized.

Experienced quartz miners of that day said that the ledge could not he profitably worked, because the expense of draioing would be so great. But Con Riley, then, as now, one of the hest miners on the coast, said the mine could he worked, and his advice was taken. Allison Ranch became famous throughout the world. We believe there is no man who can tell how much the mine has yielded, but the amount is above $3,000,000.

The cause that almost prevented the ledge from heing worked in the first place, now stands in the way of reopening the Allison Ranch mine, namely, the peculiarity of location as to drainage. But machinery for draining purposes is much more complete now, and much cheaper than in the days of the first working of this mine. And a comparatively very emall portion of the ledge of Allison Ranch mine has been taken out and milled. With the mill processes now in use, the saving the gold would very greatly exceed that of the days of the other workings.

W. H. PATTON, general manager of the operations in the mines controlled hy Messrs. Flood and Mackay at the Quijotoa, is on his way from Arizona to Pittsburg, Pennsylvania, to close a coutract for the iron pipe necessary to bring water to the new mill site at the mines. It seems as if these people, who made their money on this Coast, ought to spend it here, too. The San Francisco foundries make as good iron pipe as is made any where in the world, making a specialty of it and having special machiuery. The pipe ought to have been purchased here.

MECHANICAL PROGRESS.

Growth of American Iron Industries.

There is every reason to believe that this country would have taken a prominent part in iron production at an early period of its history had the development of the business not been obstructed by British policy. More than 200 years ago iron had been smelted in Maryland and Massachusetts, but the British rulers put so many restrictions upon the business that its growth was retarded. Yet under the most discouraging auspices iron making made some progress in the American colonies, for as early as 1735 the officers of the naval arsenal at Woolwich, England, reported to their government that the American iron they received was better for ship-building purposes than Swedish iron.

When our revolutionary war broke out, the iron furnaces of Pennsylvania were turning out about 6,000 tons of pig iron and 3,000 tons of bar iron annually. Maryland came next, with about half that production; and New Jersey, New York and Virginia were working into an iron-making business. The war of Independence had a stimulating effect upon our native iron industries, for they were required to furnish much war material, and the supply of European-manufactured iron was to a great extent cut off, leaving our native makers to provide for the market. By the time independence was achieved and peace proclaimed, the iron industries of the young nation appeared to have entered the way of prosperity.

When the confederation of the States was formed, it made no provision for the protection of its native industries. The United States started into life as a true free-trade country, there having been no restrictions placed on foreign imports. This system worked all right during the war, for foreign countries could not then trade freely with us. But so soon as peace was proclaimed the British merchants, following a policy from which they have never departed, flooded this country with cheap hardware, and closed all the furnaces in America. This caused wide-spread distress among those who were dependent on this work for their livelihood, and most of the iron masters were ruined, while all other lines of business suffered in sympathy with manufacturing depression.

The British teaching regarding this country was that agricultural pursuits were the proper line for our people to follow. They said: "Let you Americans go into farming, for which your country is so well adapted, and raise agricultural products for our market. We are ready to buy your corn, and cotton, and tobacco; we will keep an open market for your hides, and wool, and lumber. Your people will prosper by following business in that way, but do not attempt to compete with us in manufactures, for we are chosen to excel all others in these departments of labor."

This kind of reasoning was quite satisfactory to those parties who enjoyed ministering to British prosperity, but the majority of the people in the young American States had not then been schooled in free-trade theories. They were unphilosophical enough to believe that charity should begin at home; they could not understand how it was for their good that their iron business and other manufactures had been ruined, and a strong protectionist sentiment spread through the States. As a result of this, in 1790, protective import duties were imposed, and a defined policy for the protection of American manufactures was inaugurated. This effected a wonderful improvement in the condition of the States. When the people found they could not be readily undersold by foreign competitors, they willingly devoted their attention to manufacturing pursuits. Raw materials that had formerly been sent to Europe, in many cases to be returned here for sale with the added expense of labor and transportation, were now worked up in native factories. Within a few years the foundations of our industrial prosperity were laid, and the shield of protection prevented them from being swept away by the floods of European capital drawn from the hands of under-paid labor.

Compressing Iron, Hot or Cold.

The quality of movement of the particles of iron under pressure or percussion is a remarkable one, whether the change in the arrangement is made while the iron is hot or when it is cold. Red-hot iron can be pressed to fill a mold as clearly and exactly as so much wax could be, and the grain of the iron will certainly follow all the contour of the mold. Thus the head of pickaxes and articles of a similar form can be shaped by pressure, the metal that is removed to make the hole for the helve being forced to form the projection of the adze-like head. Cold iron can also be molded into form by pressure, a method largely practiced to finish drop-forged iron articles. The heading machine for making rivets, bolts and wood-screw blanks show some surprising results in the compression of iron; a No. 6 one-inch screw requires a piece of wire slightly more than ½ inches long to form it. Yet the total length of the screw blank headed is just one inch. Of this the countersunk shaped head is one-eighth of an inch by five-sixteenths of an inch widest or top diameter. Now it has been proved by experiments with shorter bits of wire that less than five-sixteenths of an inch of the extra eight-sixteenths is required to form the screw head. What becomes of the remaining more than three-sixteenths of an inch in length of an original 1½ inches that makes the one-inch screw blank? There can be but one answer—the iron is driven upon itself; in other words, three-sixteenths of an inch of wire is compressed into seven-eighths of an inch (measuring under the head), so that 1 1-16 inches of wire is compressed into seven-eighths of an inch in length without increasing the diameter of the wire.—*Manufacturers' Gazette.*

Handles for Cold Chisels.

The cold chisel is the crudest tool used by workers in the metals, albeit one of the most effective. It is a bar of cast steel with a wedge edge, varying from a parallel blade to a gradual thickening from edge to stock. Its work is always by percussion, and the material of the hammered head and the driven edge is the same, only that the latter is hardened and tempered. And yet, for some purposes, the cold chisel should have a handle of material differing from that of the bit or cutting portion. When the chisel is entirely of steel the blow is transmitted, with all its direct energy, to the edge. In many instances this blow "stunts" the edge, and leaves the thinner portion in the cut. Every "chipper" knows that much of his success depends on his skill in preventing this mishap. Yet for most of the ordinary work of the chipper the solid steel chisel is the best, on cast iron especially, and for starting and driving a keyway in wrought iron. But for the final chip, the finish, especially in yielding metals, as brass, wrought iron and soft steel, is better done with a chisel that softens the blow before it reaches the cutting edge. This can be accomplished by means of a wrought iron chisel with cast steel bit, the two being welded together. With such a tool, light, thin, smooth shavings can be taken, leaving the work almost free from the chatter marks that necessarily accompany the use of the solid cold chisel. These chisels were tested many years ago, and were proved to be excellent for the finish work on a job. They have not come into general use, probably because of the trouble and cost of making and relaying the chisels. For very delicate work, even wooden handles are—or have been—successfully used. The channeling of some small steel dies for working soft sheet brass could not be done by the solid chisel, but the work went well when the chisels were inserted in solid wooden handles. The handles, which were fitted with screw jaws for holding the shanks of awls, small wood chisels, screw drivers and similar tools, proved to be excellent for these light purposes. These wooden handles were fully as effective in chiseling by blows on copper and hard brass, when the solid steel chisel lodged in the metal or broke its edge if the blow was not in a direct line with the chisel.—*Scientific American.*

DRILLING AND BORING WOOD.—The hand-drill or breast-drill, originally intended for the hand drilling of metals, has taken its place among wood-working tools. In many instances it has displaced the bit-brace, or at least has filled a requirements left unsatisfactorily supplied by the bit-brace. The breast-drill may be used for drill, gimlet or bit, and its speed, on the best forms, may be changed at will without a change of speed of the hand. It has its advantage, also, in the more natural motion of the hand—the vertical crank movement, instead of the horizontal crank motion. A drilled hole in wood, for whatever purpose, is better than a bored hole. The drill cuts a clean hole, not merely finding its way between the fibres by displacing them, but removing the material entire as it advances. The gimlet form of wood-borer is crude at best; a thread at the end is supposed to enter the solid wood, and by spiral friction pull the cutting portion after it. The cutting portion is a twist like a twist drill or augur, supposed to deliver the chips, which it never does deliver. The pressure of the hand is necessary to force the gimlet into the wood, and the pull of the hand is required to release it and empty the chips. The drill cuts a clean hole, and has none of the objections of the gimlet. Unlike the gimlet it may be resharpened so long as it lasts. Its speed in the breast-drill is very much greater than that of the gimlet in the bit-brace.—*The Industrial World.*

STEAM ENGINEERING.—In working steam engineering up toward the condition of a science, practice, has for the past 50 years been constantly correcting the deductions of theory. Unforseen elements are constantly met with in practice that have neutralized and modified apparent facts. The gain from expansion has been found to have been greatly over-estimated, and the results that were reasonably expected from high pressure have not been obtained. Patient, practical research, with many failures, must be depended upon to further improve the steam engine.—*American Machinist.*

PECULIARITIES OF MANGANESE STEEL.—Manganese steel is very dense, tough and hard. It does not require to be forged or rolled to impart strength to it like most steel. It does not tarnish readily; magnet does not attract it. When brought to a white heat and plunged in water it turns soft and not hard. Its castings have very few flaws. It is made by pouring from 10 to 12 per cent of rich ferro-manganese into molten steel, and mixing the two together before the alloy is run off into ingots.

SCIENTIFIC PROGRESS.

Santa Barbara Natural History Society.

This society held its regular monthly meeting January 27th. The meeting was a very interesting one. After the reading of reports and the transaction of some other business, the matter of the purchasing of a valuable collection known as the "Clark Museum" was proposed and carried. A large number of minerals, Indian relics and other matters of scientific interest were also presented, and added to the already valuable collection of which the society is the possessor. An elaborate paper, supporting the theory of the ancient origin of the "Calaveras or Whitney skull," was contributed by Dr. Yates and read by Mr. H. C. Ford.. Mr. Ford also read a very interesting paper on

Fossil Wood,

Which he said was found at various localities throughout the State. Silicified wood is a variety of quartz. The wood fibre is gradually replaced by quartz, leaving the form of the wood intact, so much so that sections cut and placed under a microscope show the characteristic grain of the wood, by which the genera may often be determined and sometimes the species.

In the collection of the "State Mining Bureau" specimens are found from the following places in the State: Portorsville, Columbia, Lower Lake, Angels' Camp, Gold Run and Dutch Flat, Volcano, Burwell Valley, Calistoga, Chalk Bluffs, in great variety, San Luis Obispo county 20 feet below the surface, Santa Rosa wood before being silicified had been pierced by worms, and Mono Lake.

Continuing his remarks, he said: At the western base of Pike's Peak in Colorado I visited in 1869 a so-called petrified forest where stumps of trees several feet in hight and some 12 or 15 feet in diameter. One stump seemed to have been fossilized while in a charred state, from which I obtained fossil charcoal. Many of the specimens of wood were encrusted with layers of crystallized chalcedony of an opalescent tint, so beautiful that sections were mounted and worn as jewelry. At the mining exhibition of 1882, at Denver, and at Green river in Wyoming, I saw sections of fossil trunks of trees 20 inches in diameter and several feet in length like hollow tubes, with the interior surface entirely studded with pure quartz crystals. Upon the summit of a hill in the South Park, Colorado, our party obtained a large quantity of so-called wood jasper, fossil wood of nearly all the tints which are found in that form of quartz, many of which, with the lapidary's skill, were cut into ornaments of great beauty.

Specimens of fossil palm wood are found in Wyoming Territory along with the bones of the rhinoceros, showing a former tropical climate. Five examples of silicified palm are found on Cherry creek near Denver, Colorado, and in 1872 I carried from the locality to Chicago a palm stump weighing about 200 lbs.

The petrified forest near Calistoga, in this State, covers an area of about 20 acres, and contains about 100 fossil trees, some 40 feet long, all lying prostrate on the ground, pointing toward the north. In nearly all the localities where an abundance of such fossils are found, hot springs also occur either flowing at the present day or bearing evidence of having been active at a former period. Hot water seems to have been one of the agents through which the tissues of the wood have become silicified.

In the collection of Dr. Yates may be seen a fine example of a silicified mass of tules that the Doctor took from a hot spring near Clear Lake county. An exceedingly interesting specimen also in the possession of Dr. Yates bears evidence of having been bored by pholads before being silicified, and at a later period the cavities being filled with mud, which is also fossilized.

The large and valuable specimens donated to the museum of our society by Mr. Stearns was obtained by him at Unga Island, Alaska, where no living forests are found. One species of fossil palm is represented in the Miocene formation of Oregon, and one in the Pliocene of the Chalk bluffs of Nevada county in this State. Sesquereux has described eight species of fossil Sequoia found in Colorado, Montana, Wyoming and Utah, while we have two species, and the only, left as survivors of the past geological age. He also describes two species of Eucalyptus, one found at Black Buttes and the other at Green river, Wyoming. The Araucaria, Salishuria and Phyllocladas families found in Australia, Japan and New Zealand, also occur in this country in a fossil state.

The petrified forests near Holbrook, Arizona, contain such quantities of fossil wood that a company have recently purchased the tract and commenced the shipment and manufacture of the silicified wood into tablets, tiles, and various ornamental articles used in building and finishing. An establishment has recently been started in San Francisco for cutting and polishing the fossil wood taken from this wonderful deposit. It is stated that the article is fast driving California onyx from the market as a material for mantels, etc., as it is susceptible of a higher polish and is more durable. We collate the above from the Santa Barbara *Press.*

HYDROGEN BY ELECTROLYSIS.—Of all possible methods for the production of hydrogen, that of the decomposition of acidulated water by dyuamo-electric machines would appear, on the face of it, to be the most extravagant. Yet the question has often been put to the editor of *La Nature*, and in a recent issue the process is explained, and its practicability denied once for all. Supposing a perfect dynamo—that is to say, a machine capable of converting all the work of a motor into electrical energy; and also a perfect voltameter, having no resistance and using all the current in producing electrolysis of the water. Under these theoretically perfect conditions, a horse-power developed by a steam engine will in an hour decompose exactly 166 grammes of water, and set at liberty 18.5 grammes of hydrogen, measuring 206 liters, or 7.27 cubic feet. Supposing that practically the chemical action really utilized by the voltameter represents 70 per cent of the total energy; it follows that a horse-power can only produce 13 grammes, or 146 liters, of hydrogen per hour. The production of a cubic meter of hydrogen per hour would therefore require the total energy of about seven horse-power. Thus the production of 1,000 cubic feet of pure hydrogen by this method would be effected by the expenditure of nearly 200 horse-power for an hour; and the probable cost of the process may be left to the reader's imagination.

CONVERSION OF NEBULÆ INTO STARS.—The whole range of astronomy presents no speculations which have attracted more attention than the celebrated nebular hypothesis of Herschel and of Laplace. We shall first enunciate these speculations, and then we shall attempt to indicate how far they seem to be warranted by the actual state of scientific knowledge. In one of his most memorable papers, Sir William Herschel presents us with a summary of his observations on the nebulæ, arranged in such a manner as to suggest his theory of the gradual transmutation of nebulæ into stars. He first shows us that there are regions in the heavens where a faint diffused nebulosity is all that can be detected by the telescope. There are other nebulæ in which a nucleus can be just discerned; others again in which the nucleus is easily seen; and still others where the nucleus is a brilliant, star-like point. The transition from an object of this kind to a nebulous star is very natural, while the nebulous stars pass into the ordinary stars by a few graduated stages. It is thus possible to enumerate a series of objects, beginning at one end with the most diffused nebulosity, and ending at the other with an ordinary fixed star or group of stars. Each object in the series differs but slightly from the object just before it and just after it. It seemed to Herschel that he was thus able to view the actual changes by which masses of phosphorescent or glowing vapor became actually condensed down into stars.—*Popular Science Monthly.*

EFFECT OF PRESSURE ON THE MELTING POINT OF ICE.—The experiment of Bottomley, which apparently illustrates the fact that increased pressure lowers the freezing point of water is well known. A wire weighted at both ends is thrown over a cake of ice and cuts through it. The ice melts beneath the wire and freezes above it. Professor Guthrie, at a meeting of the Physical Society, held in London, April 28, 1883, gives his reasons for believing that the wire conducts heat to the ice from the atmosphere, and that the experiment does not illustrate the well-known fact that increased pressure lowers the freezing point. A silk wire, weighted to the same amount as a metallic wire, will not cut through a block of ice.

THE BEE has long been a type of the industrious worker, but there are few people who know how much labor the sweet hoard of the hive represents. Each head of clover contains about 60 distinct flower tubes, each of which contains a portion of sugar not exceeding the five-hundreth part of a grain. Some patient apiarian enthusiast, who has watched their movements, concludes that the proboscis of the bee must therefore be inserted into 500 clover tubes before one grain of sugar can be obtained. There are 7,000 grains in a pound, and as honey contains three-fourths of its weight of dry sugar, each pound of honey represents 2,500,000 clover tubes sucked by bees.

WATER-PROOFING MATERIAL.—When paraffine is thoroughly mixed with linseed oil, cast into small blocks, and allowed to cool, it may be used to make any fabric, as cloth, felt and leather water-proof by rubbing it with such a block, and ironing afterward to equalize the distribution of the material in the pores. If too much is not put on, the material may be made to be only impervious to water, but not to air, as the very small greasy pores repel the water but not the air.

CHLOROPHYL.—From recent researches it appears that chlorophyl, the remarkable substance to which the vegetable world owes the color of its foliage, is made up of two coloring matters, a green and a yellow, the relative proportions being 100 of the former to one of the latter. Both have been lately obtained in the crystalline state.

A MUSEUM.—Pasadena is to have a scientific museum, to be established under the direction of Gen. Edwin Ward, a gentleman eminently qualified for such an undertaking.

TO DEODORIZE KEROSENE.—A little chloride of lime, dissolved in warm water, left in a lamp or can which has held kerosene will deodorize it very soon.

TABLE OF CONTENTS.

EDITORIALS.—Taylor's New Rock Crusher; Lucine District; California Minerals for New Orleans, 121. Passing Events; Experiments with Filtering Apparatus for Leaching Process; Expenditures on Claims, 124. The Washington Monument, 125.

ILLUSTRATIONS.—The Washington National Monument; Taylor's Patent Rock Fine Crusher, 121. Specimens of Mineral Blocks in the Washington National Monument, 125.

CORRESPONDENCE.—Trinity County Mines, 122.

MECHANICAL PROGRESS.—Growth of American Iron Industries; Compressing Iron, Hot or Cold; Handles for Cold Chisels; Drilling and Boring Wood; Steam Engineering; Peculiarities of Manganese Steel, 123.

SCIENTIFIC PROGRESS.—Santa Barbara Natural History Society; Hydrogen by Electrolysis; Conversion of Nebulæ into Stars; Effect of Pressure on the Melting Point of Ice; Water-Proofing Material; Chlorophyl; A Museum; To Deodorize Kerosene, 123.

USEFUL INFORMATION.—Receipts for Shoe Blacking; Casting Plate Glass; Nickel Cooking Utensils; Kerosene for Paint Brushes; Tinning Knives; A New Boulevard Pavement; Lustrous Polish for Cabinet Work; For Mending Lamp Tops, 127.

GOOD HEALTH.—Rheumatism; Good Common Sense; Danger from the Looking Glass; Damp Houses; Iron Sewer Pipes not Always Safe; Cinders in the Eye, 127.

MISCELLANEOUS.—Determination of Phosphorus; Notes on the Patio Process; The Famous Allison Ranch Mine, 122. A Profitable California Gold Mine, The Blind; Custom Smelters; Marking, and Apex of Mines; The Father de Smet, 126. American Woods; 127.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 128-29.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 132.

Passing Events.

The strike of the iron-workers in this city is over, the employers having taken men back at the old rates.

Rich gold and silver strikes have been made in the Elk mountains near the Colorado river, San Juan county, Utah. The outlook is that there will be a stampede of miners from northern Utah to the new mines. It is said the new mines are in a sandstone formation, like those of Silver Reef.

Very shortly now the prospectors will be out in the mountains again. The pleasant weather on this coast is in marked contrast to that on the other side of the mountains.

The miners' strike at Tuscarora, Nevada, and at Wood River, Idaho, continues. It is believed that the Tuscarora miners have made their last bullion shipments until the deadlock between the management and their employes upon the wage question is unbroken. The employers want the miners to work for $3 per day instead of $4.

At Butte, Montana, the outlook is rather discouraging. The recent drop in the value of copper has rendered mining unprofitable, and the Alice has already been closed down, and others will soon follow. In the meantime negotiations are going on between the railway and steamship companies, with the view of obtaining the lowest possible rates of freight to England. Miners' wages will probably be reduced, and everybody is anxious at the prospect.

Experiments with Filtering Apparatus for Leaching Process.

The solving process for the extraction of silver from its ores would be more commonly used, were it not for certain objections to its practical application. In the first place, ores containing clay and lime, or those which, if pulverized, produce very fine pulp or slime, are almost impossible to leach. Then, to leach large quantities of ore, a great number of tuhs or tanks for storing liquids are required. The time for leaching a hatch of ore is too long—from 30 to 72 hours, and the use of large quantities of liquid is required. An apparatus, invented by Juan F. Macay, designed to facilitate the leaching process, has been put at work in this city, at No. 23 Stevenson street, and during the past week tests have been made with it, which, being of a practical nature, and witnessed in part by a representative of this journal, we shall describe somewhat in detail.

In effecting the separation and filtration, it is important to keep the filtering surface from being clogged. In tuhs, they can only leach through a certain depth of ore, a very slow process. Mr. Macay uses a large, iron-bound wooden barrel, carrying inside it another barrel or cylinder, this inner one being perforated with holes, and is lined with asbestos cloth or canvas for filtering material. Between the inner and outer cylinder is an annular space, kept in place by longitudinal and circumferential partitions, the former of which divide the space into a number of distinct compartments, each provided with a draw-off cock for running off the liquid when separated by filtration. The cylinder is set so as to be rotated, and is provided with doors or manholes in one of the heads, by which the pulp may be introduced and undissolved residue removed. Through the hollow shaft or journal is a pipe into which air may be introduced into the space between the cylinders, so as to maintain a pressure in the space. When the reagents and pulp are put inside, the cylinder is rotated, and the solid matters are brought into intimate contact with the solvents or reagents, and by forcing in air to the space, the filtering surface is kept clear, as the ore has to pass through the filtering medium into the inner cylinder. Thus any solid matters that may adhere to the cloth filtering surface are disengaged from it, and the solid matters are kept in suspension in the liquid, so chemical action and a thorough admixture may take place.

The annular space between the inner and outer cylinder being divided into compartments by longitudinal divisions, the liquid which passes through into it is carried round by the rotation of the cylinder and flows back into the inner cylinder, thus helping to keep the filtering surface clear and unobstructed. When the soluble substances are dissolved or chemically acted on, and it is desired to separate the liquid from the solid matter, the draw-off cocks are opened, and then, by giving a slow rotary motion to the apparatus, the liquid may be decanted off from the bulk of the solid matter, and at the same time filtered from any such matter which it may hold in solution by passing through the filtering machine. By this rotary decanting action a practically clear filtering surface, unobstructed by solid matter, is constantly presented for the liquid to pass through.

The experiments and tests were made by Kustel & Co., of this city, at our request; Mr. Macay asking us to select some one to carry out the experiments, who would do so in a careful and satisfactory manner. The ore selected for the test was delivered to them in a pulverized state, and was passed through a coarse sieve in order to free it from coarse gravel and impurities. It was then thoroughly mixed and carefully sampled. To prove the fineness of the material, some of it was passed through a series of sieves, and proved to consist of 47 per cent passable through a 100-mesh screen, 9 per cent through an 80-mesh, 19 per cent through a 60-mesh, 16 per cent through a 40 mesh, and 9 per cent through a 30-mesh sieve. Most of the material that passed the 100-mesh sieve was of a clayish nature, which would furnish a considerable amount of slime in wet crushing, a disadvantage to the old style of leaching in tuhs. The coarse pulp was quartzose. Some of the ore was carefully concentrated in a pan, and proved to contain 1.1 per cent of sulphurets, chiefly consisting of copper and iron pyrites, with but little lead and silver sulphurets. The raw ore, proved by careful triplicate assays to contain $61.27 in silver and $15.07 in gold per ton. This 120 pounds of the raw ore was thoroughly mixed with 10 pounds of calcined salt and some sulphate of iron, on account of the low percentage of iron in the ore, and roasted in a reverberatory furnace for four hours. The ore was first roasted under a moderate heat for two hours, and the temperature gradually raised during the last two hours under constant stirring to effect the highest possible chlorination.

The ore was discharged into the pit below, and left to cool until next morning. The ore was subsequently sifted, mixed and carefully sampled. It proved by triplicate assays to contain 40.58 ounces of silver, or $52.47; 0.6 ounces, or $12.56 in gold per ton. A chlorination assay showed 74.6 per cent of the silver converted into a chloride. No sulphate of silver was detected in the roasted ore.

To test for working results in the rotary decanting filter, 70 pounds of the ore were charged into the barrel and just sufficient water (28 pounds) added to wet the ore before introducing the extracting solution. This latter was made by dissolving 13 pounds of hyposulphite of soda in 70 pounds of water, which is equivalent to one part of the salt to five parts of water.

The solution (83 pounds) was introduced into the apparatus, which was allowed to rotate at the rate of 20 revolutions per minute for half an hour, thus giving the solution plenty of time to dissolve the chloride of silver. Thereafter the discharge holes in the outer barrel were opened, and the silver-holding liquid allowed to flow into a receptacle.

The discharging of the liquid took about 20 minutes. The discharge holes were then closed, and air forced into the barrel by means of a pump (pressure of one atmosphere) for half an hour, in order to dry and free the pulp as much as possible from the silver-holding liquid. After opening the discharge holes and letting the last liquid flow out, a tailing sample was taken from the barrel, which proved to contain about 20 per cent moisture. The second washing of the ore was begun with a weaker solution of hyposulphite of soda, by dissolving 4 pounds of salt in 40 pounds of water, and the same manipulation repeated as with the first solution. Another sample was taken from the barrel after the ending of the second washing (1 hour), and it proved to contain about 21 per cent moisture. The third washing was done with 42 pounds of water, and another sample taken after the lapse of 1 hour, which showed 20 per cent of moisture. Total time consumed in three washings, *three* hours.

The three samples were hereafter treated as follows, in order to ascertain the amount of soluble silver left in the tailings as a double salt of hyposulphite of soda and chloride of silver after the three different washings; five ounces of ore were repeatedly treated with hyposulphite of soda until no reaction was obtained in the filtering liquid with sulphide of sodium. Then sulphite of sodium was added to the filtrate, the precipitate filtered, washed, dried and oalcined on a roasting dish in the muffle. The residue was then melted with pure lead in a scorifier, and the regulus cupelled. The obtained silver was found to represent the following values and percentage of silver left in the tailings in the form of a soluble double salt after the 1st, 2d and 3d washings:

No. 1, 5 oz. ore gave 0.064 gr. sil.=0.77 oz.=$1.00 per ton
No. 2, 5 oz. ore gave 0.023 gr. sil.=0.27 oz.=$0.33 per ton
No. 3, 5 oz. ore gave traces of silver.

In other words, 97.45 per cent silver was extracted after first washing; 99.1 per cent after second washing; and 99.8 (?) per cent after third washing.

Total loss of silver in the tailings as a soluble salt, only a small fraction of one per cent.

All of these tests were carefully executed, and mainly with the view of determining the amount of silver left in the shape of a soluble double salt in Mr. Macay's apparatus after the three different washings. The percentage of silver obtained refers therefore to the amount of chloride of silver present in the roasted ore, and no attention was paid as to the most proper way of working the ore and obtaining the highest possible bullion output, as this was not required.

Messrs. Kustel & Co. consider these tests prove the advantages of this system of dissolving and filtering over the common leaching boxes to be as follows: Ores too finely pulverized (100 to 120 mesh), or those which produce too much slime are practically impossible to lixiviate in the common leaching boxes, while in this new apparatus, according to the results obtained in the tests above described, with ore which contains 47 per cent of fine slimy material, from 97 to 99 per cent and a fraction of the silver were obtained, existing in the ore as chloride of silver, and this with only two washings. Considerable time is saved, as the dissolving of the chloride of silver is effected quicker and more thoroughly by revolving the barrel and mixing solution with ore, no matter in what condition of fineness the ore may be. By means of pressure the desilveration or separation of the silver-holding liquid from the tailings is accomplished to a higher degree and in a much shorter time than in the old way.

Much space would be saved if this apparatus can be made to hold ten tons and work six charges (60 tons) in 24 hours, while in the old way a large number of vats would be required to do this. A higher percentage of the soluble silver salts can be obtained than in the ordinary leaching tuhs, as with a large barrel and an increased pressure of four atmospheres the moisture or amount of silver-holding liquid could be reduced to a low percentage (five to ten per cent), thus effecting a higher saving of silver than in the old way, by which about $4 per ton of the soluble silver is lost on an average with the tailings.

Ordinary silver ores not of a very rebellious nature, say of an assay value of 40 to 60 ounces silver per ton, would require two washings only in this apparatus with hypo-solution, and 99 per cent of the present argentic chloride could be extracted. Should the ores be of a very base nature, a previous washing with water would be required before using the solution; or, if richer in silver, another washing after the two washings with hypo would be probably necessary.

Messrs. Kustel & Co. are of the opinion that this apparatus of Mr. Macay's could, with some modifications, be applied in the extraction of gold by means of chlorine, or the extraction of copper by the Hunt & Douglass process, and in fact in all those industries where large bulks of solid matter, coarsely or finely divided, have to be washed and the liquid separated by means of filtration.

Expenditures on Claims.

A memorial and joint resolution has been prepared asking Congress to repeal the law requiring annual assessment work to the amount of $100 to be done on unpatented claims, and substituting in lieu thereof the annual payment of $50 to the school fund of the county in which the claim is located.

This seems an injudicious movement. When work is done on claims it develops them to some extent, and the work done inures to the miner's benefit. But when simply a tax is paid for school in similar purposes no good is done to the mining interests at all. Moreover, a lot of wealthy men could keep any number of claims idle in that way, while poor men can better afford to work out assessment work than pay for it in money.

The step is one in the wrong direction altogether. We want men encouraged to develop their claims. In fact the present law has brought to the front many thousand mines which would never otherwise have been heard of. Men in doing assessment work prove the value of claims, and continue to work them. But paying a tax would never do this.

Moreover, when men do not now work their claims some one else will relocate them, and if they do they must work them to a certain extent. But a claim on which no tax was paid might be relocated, and the relocator pay the tax without doing any development at all. We have enough idle claims as it is, and want no more. The bane of the whole country is the fact that so many prospects are only worked when the law forces the owners to work them. Without a law to so compel work being done the number of undeveloped claims would increase. The present law is good enough, and if taxes are to be raised for school purposes they should be obtained without taxing the mining industry, which is heavily burdened under present conditions.

NEW settlers in the vicinity of Midford, Southern Oregon, are cultivating rice.

The Washington Monument.

Now that the great Washington monument approaches completion, renewed interest pertains to California's share therein. So many years have passed since California sent on her contribution that the fact is nearly unknown to the present generation. It is 33 years since the subject stirred the zeal and awoke the effort of the pioneers. In 1852 the California stone was hewn out of a quarry of the finest variegated marble at Ringold, El Dorado county, Cal., under the direction of John Bigler, Col. John F. Hall, and others and brought to Sacramento with an ox-team. It was shipped to Washington under direct supervision of Gov. Bigler.

About 15 years ago the report was brought to this coast that the California stone was not in the monument, and the following letter in answer to inquiry was received in this city:

OFFICE WASHINGTON MONUMENT SOCIETY,
WASHINGTON, D. C., Nov. 11, 1880.

OTIS V. SAWYER, ESQ., OF THE COMMITTEE OF THE SOCIETY OF CALIFORNIA PIONEERS, SAN FRANCISCO, CAL.—*Dear Sir:* In reply to your communication of 19th Oct. ult., I have to say that the information given to a member of your society, while on a recent visit to this city, by the superintendent and the watchman at the Washington Monument, touching the whereabouts of the stone presented by California, and of which you make inquiries, was not correct.

In the west wall of the moument, just above the platform, at the height of about about 150 feet from the base of the shaft, and easily seen, is a stone bearing the following inscription in sunken letters:

California,
The Youngest Sister of the Union,
brings her is Golden Tribute to the
memory of its father.

This memorial block was one of the last inserted prior to the suspension of operations on the mouument years ago.

The superintendent imagined that the inquiries made by the member of your committee referred to another stone, likewise from California, but which was *not presented on behalf of the State*. The latter stone was shipped in the year 1860, on board the ship *Flying Dutchman*, by the *miners of Columbia, Tuolumne Co., Cal.*, for a place in the Monument. This ship, after a speedy voyage, was at the last moment lost off the Harbor of New York, and the stone in question, as a consequence never came into the hands of the society.

Contributions of memorial blocks are once more being made by the States, organizations and societies of the country. A stone has just arrived from Switzerland, taken from the original memorial, William Tell chapel, erected in 1388, on the spot where Tell is said to have escaped from Gessler. Among the stones placed in the Lapidarium recently is one from Napoleon's tomb at St. Helena, and another by H. R. H., the Emperor of Brazil.

The work on the Monument is being rapidly pushed forward, and by the advent of Christmas 30 feet will have been added to the shaft this fall, and the Mouument will have attained the height of 190 feet. By May next, with the funds on hand, the Monument will reach an altitude of 230 feet. The iron stairway in the structure and the steam elevator are carried up with the masonry as it progresses. Should the Society of California Pioneers see fit to present a stone for insertion in the Monument, the society will be pleased to receive it. By direction of the Secretary, John B. Blake. Very respectfully, etc., F. L. HARVEY, Jr., Clerk.

It is a little singular perhaps that just at present there should have arisen another rumor that California was not represented, and it is now set at rest by the revival of the above document. It has also recalled the fact of money raised in 1852 by fixing contribution boxes at the polls during the presidential election of 1852. The largest amount raised by any county was gathered in Colusa county.

The original design was a white marble obelisk, 70 feet square at the base and 40 feet square at the apex, rising 610 feet, and there was to be a grand circular pantheon at the base. It was afterwards determined to dispense with the pantheon, and substitute a terrace of 17 feet elevation and 200 feet square.

The corner-stone was laid July 4, 1848, the block of marble used for the purpose being from Maryland and weighing 2,400 pounds. Disagreements among the managers delayed the work, and during 31 years only four feet in hight were added. This delay killed enthusiasm. At last, however, work was again commenced, according to the original design, with the terraces, except that the hight was reduced. This makes it still the loftiest column in the world. It will be, as the engraving shows, a plain obelisk, 70 feet square at the base and 470 feet high. While simple and majestic in form, without attempt at ornament, it will constitute a monument that will last for ages, erected by the people of the whole country to its greatest citizen.

We give on this page *fac similes* of some of the memorial blocks of stone used in the National Washington Monument. All the States have contributed. One, a black and white mottled marble from this State, has the inscription, "California, youngest sister of the Union, brings her golden tribute to the memory of its Father." Another is a block of granite, with the inscription, "The Citizens of Stockton, San Joaquin county, California. A tribute of respect to the Father of his country —George Washington. [Thirteen Stars] 1859."

It is expected that the monument will be completed and duly dedicated during the present year.

SPECIMENS OF MEMORIAL BLOCKS IN THE WASHINGTON NATIONAL MONUMENT.

A Profitable California Gold Mine.

The following is a portion of one of a series of letters on various topics, written by a prominent mining man to the *Engineering and Mining Journal*:

On our way to Plymouth, through the beautiful valleys of Amador county, we needed no guide to tell us that quartz mining is here prosecuted with great energy and success. Passing through Amador city, we visited the old Keystone mine. This property has paid dividends for 18 years past, and it is reported that sufficient ore is now opened up to keep its 40-stamp mill in operation for six years to come. They tell us that on the great mother lode, in this county, are located the best-paying gold mines in the United States.

This place (Plymouth) is a busy town of about 1,200 inhabitants. The Plymouth Con. Gold Mining Company's works are on the edge of the village. There are two large mills running 120 stamps, besides chlorination works, concentrators, blacksmith and carpenter shops, and all the usual outfit of a first-class mine. The plant is by far the largest in California, and has cost over $500,000.

Everything is run with the utmost economy and exactness. All the machinery is driven by water-power, which is owned by the company. The water is brought from the Cosumnes river, at a point 25 miles distant. The company's canals not only furnish water the entire year for power, but are also utilized to bring timber to the town. The enormous logs that are used to timber the mine, more than 600 a month, instead of being hauled over bad roads, at great expense, are easily floated down the canal from the mountains and dropped into the company's yard, almost without cost. The two mills crush an average of about 250 tons of rock a day. The one last constructed, known as the Pacific mill, is one of the best equipped in existence. The United States Treasury Department, in its report on mining, says of this mill: "It is considered a model one for effectiveness and economy. When Prof. Thomas Price was appointed purchasing agent for the great mining company at Transvaal, in South Africa, he examined several mills in this State, and after comparison, he decided to build a duplicate of the Plymouth mill."

There are three shafts, the newest one being the best shaft on this coast. It has three compartments and is vertical.

The company owns about a mile in length on the lode, and of this less than a quarter has been prospected. The principal mine consists of an immense chimney of ribbon quartz, milling an average of about 13 dollars to the ton. The ore-body is from 30 to 50 feet wide, and about 400 feet in length, and is open to a depth of 1,310 feet. I was located in 1852, and to the present time gold to the value of about four millions of dollars has been taken out, and the mine now looks stronger and more permanent than at any previous period in its history. The ore mills freely and contains one to two per cent of sulphurets. One feature of the mine is its freedom from water in large quantity. No pump is needed, a bucket running a few hours a day being sufficient to keep the mine clear. The temperature is moderate. Only two shifts of men cover the 24 hours.

It is interesting to note that after the ore is dumped into the "skip" at the bottom of the shaft, it is not touched again by human hands. Hoisted to the top of the high frame, the ore is dumped into the rock-breaker; thence into a car; then run to the mill, and finally dropped into the bins, whence it finds its way into the batteries by a self feeding apparatus, and only comes forth as gold and sand.

Extensive prospect work is now under way. A tunnel is running south, where it is believed the company has a valuable body of ore. A shaft is also sinking east of the old ones on an entirely new vein, which already gives promise of future greatness.

Messrs. Hayward and Hobart, of San Francisco, two of the trustees of the Plymouth Company, give much time to the management of the property, assisting the able superintendent by advice that their long experience makes valuable. One fact not to be overlooked is, that all stockholders, whether great of small, share *pro rata* in all the profits made. There are no mills owned by the officers, or wood contracts, or other devices, by which a few profit at the expense of the company.

The following are the items of production and operating expenses for the past twelve months:

Gold produced, 12 months, to December 1st, 1884	$1,022,543.22
Expenses	346,638.33
Net product	$675,904.89

During these twelve months, the company has paid regular monthly dividends of $50.000, making a total of $600,000 for the year.

This company is now paying larger dividends that any gold mine in North America, and is in a highly prosperous condition. The country about Plymouth is quite unlike that of most mining sections. Instead of barren rock or desert, there are fine farms, vegetable gardens, cultivated fields, and pleasant woods—a pretty country to live in. It is in the foot hills of the Sierra Nevada, about 900 feet above the sea, comfortable in summer and not too cold in winter.

This county and Nevada are now the leading gold producing counties in the country, and in both there is great activity, and new discoveries are constantly made.

The Blind.

At a recent lecture before the Cooper Medical College, forming one of the Lane Free Lectures, Prof. Adolph Barkan spoke concerning "The Blind." In beginning, the lecturer referred to the events that influenced his career and caused him to be in his present position. An account of the Vigilance Committee of San Francisco of 1856, read when he was at his home in Hungary, made a great impression upon him, and he resolved to live in this city some day. A blind aunt directed his attention to diseases of the eye. He announced his intention to treat the subject ethnologically and psychologically; at a future time the principles of the hygiene of the eye and the prevention of blindness would be treated of.

The earliest mention of the blind is in the Talmud and the Bible. In Egypt, the cradle of the Jewish people, there is still an immense number of blind, the affliction of so many caused by the so-called Egyptian eye-disease, which during the wars in Egypt, under Napoleon I, made such ravages among the French soldiers, by whom the infection was subsequently spread over the whole continent of Europe. The average of blind in Central Europe is 8 in 10,000; in Holland, only 4 in 10,000; in England, Italy and Hungary 10 in 10,000; Norway and Finland, 18 in 10,000. In Norway the high percentage is due to the great age attained by the inhabitants, the longest lived of any people in the world. The number of blind over sixty years of age in Norway is fourteen times as great as in North Germany. In the western half of the globe, the number of blind seems to increase as we go southward. In the British dominions the average is about 5 in 10,000; in the West Indies, 22 in 10,000; in the Southern States, 7 in 10,000. In China the number of blind is strikingly large. Educational blind asylums have existed three thousands of years. The blind in China are far above the level of the masses intellectually, forming a large class of wise men, prophets and minstrels. In Japan there are also many blind, the affliction of half of this number being caused by small-pox. Japanese blind are generally employed as body shampooers in bathing establishments and in private houses.

The factors of blindness differ materially in different countries. The number depends greatly upon the relative number of infants and aged persons. The greater number of children born in a country, other things being equal, the greater will be the percentage of the blind. Climate is an important agent in eye diseases. The glare of hot countries and the reflexes of snow regions are unfavorable to sight. Mountainous regions are considered more favorable to the sight than flat-lands. Brown eyes are more subject to blindness than blue. According to United States statistics, 5 in 10,000 white people are blind; 7 in 10,000 negroes. There are estimated to be 1,000,000 blind people on the globe.

Grades and kinds of blindness were described. In some cases an object must be a certain size in order to be seen. About 75 per cent of blind people are born blind. Affection of the eye by heredity is common.

In vocations, mechanics are particularly subject to blindness from accidents. Out of 14,000 persons treated by an artificial eye-maker in Paris, 1,000 had lost an eye in childhood, for the most part from gun shots and explosions of percussion caps. It was thought by the lecturer that it would be advantageous to the community if some other way of celebrating 4th of July could be devised, as it is a fruitful source of blindness. The diseases of cataract and granulated lids were spoken of.

The exquisite sense of touch of the blind was illustrated, and anecdotes were related of their fine sense of hearing. The blind surpass those blessed with sight in the retentiveness of their memory. The question of the intellectual development of the blind was a topic much agitated in the eighteenth century, and it was at that period that Diderot's writings on this subject appeared. Some of the fruitful lives and achievements of blind people were referred to. The benefits enjoyed by the blind in various institutions of the world were remarked, and the system and management of the State institution at Berkeley were described and praised. "There," the lecturer said, "the blind and deaf-mutes lead an almost enviable existence in one of the loveliest spots in the world."

In conclusion, the lecturer spoke at length of the urgent need of aid for adult blind, who are not permitted at present the advantages that blind children possess, and the bill at present before the Legislature to establish an industrial home for this class of unfortunates was mentioned in favorable terms.

MINE VENTILATION.—The *Park Record* (Utah), in speaking of the Sampson mine, says: The drain tunnel on this property has been driven in some 600 feet, and is being pushed as rapidly as circumstances will permit. Bad air made it necessary for a shaft to be sunk from the surface to connect with the tunnel about 200 feet from its mouth. This was done, and a box ventilator 12 inches square was run from the shaft to the face of a steam pipe connected with it, where it begins to rise in the shaft, and when a shot is fired the stream is turned on, creating such a draft as to draw all the bad air and smoke out almost instantaneously. The arrangement is a very ingenious one, and is far ahead of air compressors and fans. The company has resumed work in the stopes from the 200 level, and considerable ore is being shipped by them.

Custom Smelters.

From the preparations now going on in several localities it is certain that a large number of well developed mines, which have been idle for one or more years, will be vigorously worked early in the spring, and an enlarged production from them maintained during the year. Litigation and disagreements among owners, in many instances, have been arranged so that work can be resumed. On other properties owners have given up experimental tests looking to the erection of special works for the treatment of particular ores, having become thoroughly satisfied that the competitive cash ore markets are really more to their advantage than are private works under their own supervision. This conclusion is not a hasty one, because repeated and costly tests of every kind have been made so carefully as to leave no doubt in the minds of mine owners, and hence their decision is an emphatic endorsement of the superior facilities possessed and carried out by the large smelting establishments of the valley cities.

When men of ample capital and shrewd business judgment thus openly abandon the project of erecting private reduction plants because they find it to their interest to contract their output or place their ore in open market it looks very much like an admission that our established smelters cannot profitably be competed against by individual works. It also conveys the impression that experienced smelters are doing work at reasonable rates, and therefore giving satisfaction to their patrons. It is easy to talk against the charges of the smelters, but when business men, who own one large property merely, begin to ponder the subject of construction, they find so many ramifications to it, requiring the outlay of much capital, and the employment of constant personal supervision, that they hesitate to inaugurate the enterprise, and come to the very sensible conclusion that mining and smelting are not necessarily one and the same thing, in a legitimate business point of view. The more the subject is made a study, the less attractive reduction becomes in the face of existing facilities. Colorado has to-day the best ore markets, and the best and cheapest reduction advantages of any mining country in the world. Certain camps may, of course, have all the requisites for the inception and successful operation of smelting plants, but individual works are no longer to be thought of in comparision to works started and operated for the general reduction of all kinds of ores.—*Denver Tribune-Republican.*

Marking and Apex of Mines.

In the case of Eilers vs. Boatman, the Supreme Court of Utah decided the following points:

"The occupant of mining ground on the Government domain will be protected in his right where his appropriation of it is by means which are a substantial compliance with the law, and which, in view of all the surrounding circumstances, impart notice to those who have a right to know that the particular mining ground is subject to the dominion of some private claimant; therefore, a mining claim is sufficiently marked out on the ground where stakes and monuments are set at the accessible parts, the inaccessible parts being definitely referred to by courses and distances which are sufficient to point out to any one honestly endeavoring to ascertain where the lines of the claim run. The claimant is not required to be exact in running the lines or in fixing the corners or other posts; a difference of a few feet or a few points between the monuments fixed at the time of the location and those fixed by an actual survey for patent is immaterial, and does not affect the validity of the original location, nor the right of the claimant to the ground as surveyed." * * "As between two locators and as affecting their rights only, one cannot locate ground of which the other is in actual possession under claim or color of right, because such ground would not be vacant and unoccupied; but the possession of a vein recognized by the mining laws to which protection is given is by one who holds the surface where the vein makes its apex." * * "The location of a vein or lode made upon the surface where the vein or lode finds its apex will not be defeated by the secret underground workings and possession by parties having no possession of or right to the surface embracing it."

MECHANICS' INSTITUTE DRAWING CLASS.—At a recent meeting of the management of the Mechanics' Institute, it was decided to establish for the use of members a free drawing class, for the purpose of giving those ambitious in that direction an opportunity for obtaining a freer use of hand and pencil and a more general knowledge of design as applied to manufactures and the useful arts. Professor Edward T. Baxter has been engaged as instructor, and immediate steps will be taken to provide a suitable, spacious room and the necessary furniture, and also a suitable collection of mechanical models, ornamental and architectural designs, engravings, books and illustrated publications for study and reference. The classes will meet three evenings during each week, and half-hour sessions will be held. The pupils are to furnish their own drawing paper and instruments. Manufacturers will be solicited for contributions of specimens of their various products and donations of illustrated catalogues will be gratefully acknowledged.

The Father de Smet.

At the annual meeting of the Father de Smet (D. T.) mine, held in this city last week, the following were elected: J. B. Haggin, president; Thomas Bell, vice-president; Henry Deas, secretary; Bank of California, Treasurer; Laidlaw & Co., transfer agents in New York; George E. Webber, Jr., superintendent; directors—J. B. Haggin, Thomas Brown, Thomas Bell, Thomas Menzies and Irwin C. Stump.

The bullion produced from ore during the year amounted to $474,552.94; disbursements, $234,200.70; net profit for 1884, $240,352.24. Total number of tons of ore milled during the year, 106,540; average value per ton, $4.45.

Total number of dividends paid during the year, 10 (Nos. 31 to 40 inclusive), at 20 cents per share, $200,000.

NEW SMELTER.—We learn that Mr. Brown has nearly completed his arrangements for the erection of a smelter at Kingman. A smelter at Kingman would, in our opinion, be of great benefit to that town, to the surrounding country and to the railroad company. The latter would have an increase of its carrying trade to Kingman, and no great decrease in its freightage from that point. If the ore in the lodes around Kingman was of a uniformly high grade, it would be plain that it would be to the advantage of the road that no smelter should be erected at Kingman, as in that case the road would be sure of the profit on the transportation of the ore to the smelters outside. But there is a vast, incalculable quantity of ore here of a grade which will not bear transportation, but which will pay richly if worked here, and which will remain here and never be shipped. The road will have a heavier freightage on fuel and fluxes to the smelter than it has now on the high-grade ore selected and sent forth here; and the transportation of the bullion counts for something. Besides this, the fact that low-grade ore could be profitably worked here would give an impetus to mining, and one smelter would be but the beginning, and would be followed by the erection of others. One smelter erected at Kingman insures an active town there with the certainty of increase of population and business. We wish the enterprise every success, and believe that it is to the interest of the railroad to aid it by giving it every advantage of special rates that can be fairly given. —*Mohave Miner.*

PROSPECT MOUNTAIN.—Time and development on the mines of Prospect mountain seems to be all that is needed to show up the great wealth hidden there. Maurice Hartnett, one of the most reliable and conservative miners in Eureka district, speaks confidently of the future of that section, and says that when a leaching process mill is established here that will reduce ore that assays from $20 to $30 a ton at a profit to the mine owner, that that section will keep such a mill busy for years to come. Such ore is there in abundance, and it is readily and easily mined. Several of the mines thereabouts are shipping rich ore to the furnaces here, but he believes that if they ably managed the showing in the way of bullion shipments they would make, would awaken some of the mining men of the coast out of their dormant condition. He believes the present stagnation in mining matters in Eureka district is only temporarily, and despite the acts of interested ones to keep the district back, it will vindicate itself before long.—*Eureka Sentinel.*

TOO MANY PEOPLE.—The revival of active operations in Candelaria and Belleville has been greatly exaggerated in the minds of those who are idle and living away from both places. The result is that both towns are full of idle men—it amounts to three or four men where there is employment for but one. In many cases these people have reached their destination without means, and are now recipients of charity. This bears hard upon those who have weathered the many dull days of the past year, those who have had to cut corners on expenses, and who even now, though employed, are obliged to be very economical to pay up their past indebtedness. In consideration of the chances for obtaining work being very limited, and the accommodations equally so, it is hoped that those who contemplate visiting either place, in search of work, will stay away—it is not here for you.—*Candelaria True Fissure.*

SWEETWATER.—An old Comstock miner, just returned from the Sweetwater mines, in Mono county, says there are about twenty miners in the camp, all working for themselves and making more than wages. The ledges have about the same dip as those on the Comstock, but carry very little gold. The ore is free milling, and averages $85 per ton in silver. It is packed eight miles to the mill on mules. There is plenty of wood and water close by, and the miners will soon be able to put up a mill of their own, convenient to the camp, which will greatly reduce the cost of milling.

ISAAC L. REQUA has resigned from the superintendency of the Chollar and Potosi mines and the Combination shaft, and A. C. (Lon) Hamilton has been appointed to succeed him.

BRITISH consumers, according to the estimate of the London *Economist*, have saved $30,000,000 by the fall in the price of sugar last year.

American Woods.

There are said to hs 36 varictics of oak in the United Statcs, 34 of pine, 9 of fir, 5 of spruce, 4 of hcmlock, 12 of ash, 3 of bickory, 18 of willow, 3 of cherry, 9 of poplar, 4 of maple, 2 of persimmon, and 3 of cedar. Tho New York Muscum of Natural Hlistory is to have a complete collection of the native woods of our entire country. The logs are being prepared for that purpose. They will he for the most part five feet long, a section of half the thickness of tho log at one end being removed. In this way hoth the longitudinal and transvsrse grainings aro shown. Thero is also a diagonal cut on the section, which displays the graining also. The remainder of the log remains in its natural condition, with the bark attached.

Hickory.

Some of our native woods cannot be superscded, or evcu equalled, by any woods of foreign growth. For many most useful purposes there has never been found, anywhere, auy wood possessing the excellent quali ics of our native hickory. It is not, as commonly supposed, that good hickory must be grown in the north to be of the best; its habitat extends from the Green Mountains in Vermont, following the coast range, the Alleghanics, and the Blun Ridgs througb the Carolinas, and even to uppsr Florida. And, contrary to geueral supposition, the very best of the hickory ussd in the arts, where toughness is required, is obtained from North Carolina and eastern Tennessee. "It is wonderful what toughness the hickory timber of that mountain region is capable of," said a wheel maker recently. "We can turn a piece completely around a circle without breaking a fiber." This, of course, after it is thoroughly steamed.

The Color of Hickory

Is not improved hy lying in the log. It is exposure to uir that deepens the color of all timber. If the lumber is sawn up and piled under cover in a dry, airy shed, it will continue to improve in valus for six years. In piling it, the edges of tbe hoards shonld he covered by the cross pieces, to prevent splitting, and the cross pieces should be directly over each otber, and sufficiently close to prevent hending or warping of the boards. Limbs and crotches of hickory or walnut, as it is sometimes called, are tbe most valuable parts of the trees, being better veined and grained than the stem, and are too valuahle to make posts of. The small limbs can be sawed into small stuff or squared for turning work.

Yellow Pine

Is another largely distributed and valuable American wood; but it is not so generally known tbat it is valnable for cabinct and ornamental work as wsll as for timber and other heavy use. Workers in ornamental wood now assert that yellow pine, hard finished in oil, is the rival in beauty of any wood that grows, not excepting the costliest of the hard species, it heing susceptible of receiving and maintaining as high a degres of polish as any known wood, while, when impregnated witb oil, it is almost indestructible. In such a condition it is impervious to even hot grease snd other substances tbat leaves an ineffaceahle stain upon white pine, maple and various other woods.

The Chestnut

Is also a useful and characteristic American wood, although it is indigenous in some other countries as well. There is a common tradition that the timbers of most of the old churches in Europe were chestnut. If this were the cass that species of timber must have been quite common in some countries whsre now it is extremely rare. Old oak timber is sometimes mistaken for chestnut. M. Payer, of Paris, has recsntly produced a large number of specimens of timber from the old churches and buildings in Paris, which be has subjected to careful examination, and he believes that none of them were chestnut. If lsters are drawn upon oak and chestnut planks, by means of pure sulphate of iron dissolved in distilled water, the charaeters appsar at once, in hlack, upon tbe oak, and in deep violet upon the chestnut. Ammonia produces a red color, of short duration, upon the chestnut, paler and lsss distinct upon tbe oak. All the French and American varieties of oak show very distinctly, on their transverse sections, medullary rays crossing the woody fihers from the center across ths circumferenes. Chestnut timber possesses only concentric layers.

A VALUABLE PAPER.—The MINING AND SCIENTIFIC PRESS of January 24th, is an excellent number, containing as it does an exhaustive review of mining affairs on the Pacific Slope during the year just closed. A full page, with a good map, is devoted to the New River district in this county. Every miner and mechanic in California should he a subscriher to the PRESS, as it is devoted exclusively to their interests, and every numher is filled with valuable information.—*Trinity Journal.*

THE Executive Committee of the United States Association, at the New Orleans Exposition, waited on President Arthur, Saturday, and presented a statement of the affairs of the Exposition, together with a memorial to Congress, asking an additional appropciation, which he was asked to transmit to Cougress, with his approval.

USEFUL INFORMATION.

Receipts for Shoe Blacking.

A brilliant paste blacking may, according to Dick, bo prepared by mixing two pounds ivory black, one pound molasses, one-fourth pound each of olive oil and sulphuric acid, and enough water to reduce the product to the proper consistence.

Herr Artus recommends thn following formula as lcss destructive to leather than most hlacking in use: Mix thoroughly three and a half pounds vogetablo black, one and a half pounds ivory black, five pounds each of molasses and glycerine; cut six ounces gutta percha into small pieces, molt, and when fluid add twenty ounces of olive oil, and afterwards two ounces of stearin; stir, while hot, tbe second mixturs into the first, and then a further addition of gum senegal dissolved in three quarts of water is made. This may he kept as stock, and for use diluted with ahout three times its hulk of warm water.

For liquid blacking without sulphuric acid, mix one pound finely-powdered ivory black, thres-eighths pound molasses, two ounces sweet oil, and one pint eacb hcer and vinegar. Mix the first three ingredients vsry thoroughly togetber before adding tbe last two.

A better liquid hlacking may probahly be made by the following formula: Mix one pound each of ivory black and molasses and onsfourth pound of sweet oil, and gradually add one-fourth pound of sulphurie acid diluted with three timcs its weight of water, mix well, set aside for three hours. Reduce to proper consistsncy with water. Owing to the calcium phosphats prcsnt in the ivory hlack, the sulphuric acid is provided with a bass to unite with, and does much lcs to injure the leather tban is generally supposed. The addition of sulphuric acid greatly adds to the brilliancy of the blacking, but it should hs used in no larger quantity than necessary for this purpose.

CASTING PLATE GLASS.—The operation of casting a plate is as follows: Tbe glass in the pots having attained the proper degrse of liquidity, and having received a thorough melting and refining, the fire is slackened to render the mass somewhat viscous by cooling. The doors in front of the pots are lifted or taken away; the workmen, witb a long pair of iron pincers, take hold of tbe pot in the furnace, bring it upon an iron truck or carriage, and at a dog-trot carry it under the crane. The impurities or glass gall upon the surface of the glass are now scraped off and the pot carefully wiped on the outside with a wet cloth to prevent dirt from falling upon the casting table. Tbe pot is now seized by a pair of strong iron tongs or nippers, and raised over the table hy means of the crane. The casting table is a large cast iron slab, well polished, mounted upon a carriage running over a railway. Upon tbis table two iron rules of tbe thickness of tbe required plate are now laid ou each side. Tbe pot suspended above is now tilted over and the glass poured upon the table. A heavy iron roller is now passed over the glass, the ends of which rest upon the thickness rules. During the rolling, if any impurities are detected in the glass when yet plastic, they are removed with suitable instruments. The plate is then annealed, after which it is ground, smootbed and polished, each being an operation requirlng time and care.

NICKEL COOKING UTENSILS.—In regard to the supposed poisonous naturc of nickel it may be rema·ked that nickel and copper alloys bave long been in use for domestic utensils, as well as copper itself. Such vessels must, of course, be protected from acids, and always kept clean and hright. When this is done none of the metal passes into a soluble form. All metallic salts are more or less poisonous, even the salts of iron, to which tbe salts of nickel are more nearly related thau to thosc of copper, which are indeed quite poisonous. Metallic vessels should always he kept clean, and this is true of nickel too, and there is no need to concern ourselves ahout its poisonous character. It would he very desirahle to have thorough and careful experiments made upon the physiological action of nickel salts when in solution. Birnbaum has shown that solutions slightly acidified with acetic acid, as well as the juice of sour cherries, when left for some time in nicksl vessels take up considerahle quantitiss of nickel, which confirms the view ahove expressed that acid solutions should hc kept as far away as possible from all such utensils and vessels.

KEROSENE FOR PAINT BRUSHES.—There is notbing hetter tban kerosenc for cleaning paint brushes after they have been laid aside for a long time. If it is in a very had coudition, cut off a layer of hristles on the outside, and soak it two or three days in kerosene oil, when the bristles become pliahle aud easily cleaned hy a free use of the oil and hy working tbe brush on a piece of hoard. If thoroughly cleaned with kerosene, after use, and then set away where it can he kept clean and dry, it will remain for months soft as when new. Brushes may thus be kept in prime condition, whereas, when set away in water, they are forgotten, and the water evaporates and leaves them well-nigh worthless.

TINNING KNIVES.—All knives that have that appearance are not covered with silver. Pure hlock tin is often used for tinning knives and iron spoons. The articles are thoroughly eleaned from oil or grease in a hot alkali bath; then if free from scale dip in a solution of muriate of zinc to which has been added a small piece of sal ammoniac, dry quickly over a hot plate of iron, or furnace, and immerss in a bath of melted tin for a few seconds. Have the surface of tbe melted tin kept clean by skimming and sprinkling with a little powdered resin.

A NEW BOULEVARD PAVEMENT of prepared gum wnod is undergoing a trial on Chestnut stroet, St. Louis. After the roadhed is dug out and rolled a layer of concrete is put down and coated with sand. This is glazed with coal tar, on which five-inch gum-wood hlocks are set uprightly, with an ordinary lath between the rows at the bottom to separate them. This space is filled part way up with coal tar, and the remainder with sand and gravel, which is rammed in compactly. This pavement is firm, elastic, and apparently noiscless, but costly.

LUSTROUS POLISH FOR CABINET WORK.—A fine, lustrous polisb for dslicate cabinet work can be made as follows: Half a pint of liuseed oil, balf pint of old ale, the white of an egg, one ounce of spirits of wine, one ounce spirits of salts. Shake well bcfore using. A littls to be applied to the face of a soft linen pad, and lightly rubbed for a minute or two over the article to hs restored, which sbould be first rubhed off with an old silk handkerchief. It will keep any length of tiuc if well corked.

FOR MENDING LAMP TOPS.—Use a csment prepared hy hoiling three parts of resin and one of caustic soda in fivs of water. This composition forms a soap, which when mixed with half its weight of plaster of Paris sets firmly in ahout three-quarters of an hour. It is said to bs of great adhesive power, not permeable hy kerosene, a low conductor of heat, and but superficially attacked hy hot water.

THE toad, frog and chameleon cap'ure insects by darting out the tongue, which is tipped with glutinous saliva. The hoa constricting serpents crush their prey in their coils before swallowing, and the venomous snakes have a poison fang.

GIVE THE FLIES A CHANCE.—In putting up your screen doors and windows he very particular to have a little hole in one corner so that the flies can go outdoors when they get tired of being inside.

GOOD HEALTH.

Rheumatism.

EDITORS PRESS:—I have long contemplated giving to the world a valuable receipt for rheumatism in all its forms. It is a disease that a great many are troubled with, especially miners, and one that can only he reached hy internal remedies. Embrocations or liniments rs move the pain or swelling, but do not cure the disease. St. Jacobs oil may be applied to the ankle, and the pain ceases to exist there; but tbe next morning it will be found in the knee, wrist or shoulder. Nature always makss a desperate effort to keep disease away from the vitals. Rheumatism is a disease of the blood, and if you examine the blood of one who is suffering with the disease, tbe microscope will show you the fibrin all broken up, and the blood of a darker color. Among the rheumatic, as damp weather approaches, more or less expansion of fibrous and serous tissues occurs. These sxpanded muscles or tissues press upon their accompanying nerves, producing more or less pain, according to the degree of pressure, as wsll as to the degree of sensitiveness of these nerves, and as soon as clear pleasant weather approaches, the muscle or tissue returns to its original condition, the pressure upon tbe nerves is removed, and tbe patient then becomes free from pain, and imagines himself well. You must pay strict attention to the laws of health. Medicine can only remove the present difficulty. If you go on violating those laws you must continue to suffer.

Here is the remedy that will cure in nearly every casc, and you can get it put up at any drug store. It will help you even if you have hypertrophy of the hsart, caused by rheumatism, although that cannot be cured. *Receipt.*—Take 12 ounces compound syrup stilliugia, 4 ouuces tincture cimicifuga, 1 ounce iodide of potassium; mix. Dose one teaspoonful to one tahlespoonful before each meal, and continuc its use a long time after all pain has ceased.

S. G. TURNER, M. D.
Howell's P. O., Arizona.

Good Common Sense.

EDITORS PRESS:—I no iced in a late issue of your paper a letter from Mr. Rumford concerning the Edenic diet, etc. As I have had some experience with extreme measures on the diet question, I feel that I can speak as one not entirely without authority.

After some years of ultra-vegetarianism, at the end of wbich I found myself almost ready to pass on to the next life, and put off entirely this poor little starved body, I have come back to this principle, *i. e.*, to eat whatever best nourishes and agrees with one, guarding very jealously every means hy which digestion and assimilation may be best promoted, carefully avoiding ths cultivation of auy uotions tending to extremes.

Living on bread and iruit for a long time, my digestion became so enfeebled, and I gradually became such a sufferer from inanition that finally I could not digest eveu bread and fruit. Just before tho time at which, in tbe natural order of things, I ought to have died, I tried beef broth, upon which I began to rally. I lived for months upon broiled beef and bread, and even now can digest very little fruit.

With many persons a return to ths state of nature scems the one great hobby. They forget or ignore the fact that we are the result of countless ages of departure from that state, and what was once a deviatiun from natural conditions may, become through unnumbered gencrations, as strong as nature itself to us.

A "return to a state of nature" would mean for us simply this: To walk out of our *unnatural* honses of wood or brick, put off our unnatural clothing of wool or cotton (cultivating the *natural hirsute* covering), throw away our combs and brushes, our pens, pencils, books, papers, all works of art, and "take to the woods" of Darwin's past ages. Such a consummatiou could hardly he ons to "devoutly wish for."

I thiuk one whose digestion is feeble, can soon ascertain what plain, nourishing food best agrees with him, and, as one of the publishers of the PRESS said to me not long ago, "Get the very best of that kind of food, and eat it under the best conditions." I believe any extrsme measures in dict or tho adoption of any "cranky" notions will soon or late lead one to the slough of inanition and debility.

CARRIE STEVENS WALTER.
San Jose, Jan. 30, 1885.

Danger from the Looking-glass.

There seems to be no end to the catalogue of perils to which we poor humans are exposed while peacefully sleeping in our heds, or engaged in the ordinary and quiet duties of life. Every few days we are startled by some new discovery from some previously unsuspected source of evil—the wall-paper, tbe carpet, the furnace, the drain, the fresh air, etc. We have just heen startled with the hitherto unexpected presence of danger in dress goods, window-hangings, bandboxes, etc.; and now comes the most unexpected alarm from one of womau's best and most frequently consulted friends, the looking-glass. One which has heretofore been considsred an angel of light is now transformed, into a worker of deeds of darkness.

A German M. D., one Dr. Newkirch, reports having met with several chronic cases of mercurial poison. In two cases, at least, that of a man and his wife, the cause was traced directly to a looking-glass in their bedroom, the wooden back of which was dotted all over with thousands of minute globules of mercury. Tbe apartment was heated during tbe nigbt. In another instance tbe source of the poisoning was a mirror, 40 ycars old, wbose back had become weak and from whose face the quicksilver freshness was fading. The aged culprits having heen summarily removed their victims speedily recovered. Thus has yet anotber of our trusted friends been proved false! And now we must either destroy our mirrors whils they are yet young and innocent, or else keep a watchful eye on them and hrace up their backs the moment the sign of decrepitude becomes apparent. If worse comes to worse, we can at least take rsfuge in the hurnished steel of our forefatbers.

DAMP HOUSES.—Charles T. Davis, in the *American Architect:* The commou bricks produced by most of the dry-clay machines absorb much mors water than do those made by machines which thoroughly temper ths clay. There is too much ignorance displayed in regard to the material produced by this line of inventions, and which enters so largely into the construction of huildiugs, and this lack of knowledge is often shown hy those who ought to know better. In the desire to get up a showy house, "something that will take, you know," mistakes are often made, and which are usually paid for hy the loss of health, and sometimes hy the sacrifice of the lives of those who inhahit them. Is it difficult to call to mind houses that people call "unlucky places," in which an unusual number of persons die? These "unlucky places" are for the most part nothing more or lcss than damp houses, resulting usually from the employment of porous brick in the construction of tbe walls.

IRON SEWER PIPES NOT ALWAYS SAFE.—Prof. Austin states that many clay and iron sewer pipes and house leaders are pervious to sewer gases. In one instance in Jersey City the leader was so porous that the parlor was rendered almost uninhabitable. He recommends that all sewer pipes be thoroughly varnished with shellac or soluble glass, or else paiuted with heavy paint.

CINDERS IN THE EYE.—One of the minor trials in railway travels arises from cinders in the eye. A simple and effective cure may he found in one or two grains of flaxseed, which can he placed in the eyes without paiu. As they dissolve, glutinous substance is formed which envelops any foreign body that may be under the lid, and the whole may be easily washed out.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

FROM PLYMOUTH.—Cor. Amador *Ledger*, Feb. 16: The Alpine mill was sold last week to John Evans, who has a mine a short distance from town. It is his intention to tear down the mill and rebuild it on his own claim at a point on the creek about one mile west of town. He has about 1,300 tons of ore on the dump, which he estimates will yield from $30 to $40 per ton. Evans is an old miner and is getting along in years, after spending a fortune in mining. Some capitalists from San Francisco have been in town for the past three weeks trying to purchase the claim owned by John Cupps. Green Aden, it is reported, will commence work on his mine about the first of next month, and will bave the ore crushed at the mill of John Evans. A silver mine is reported to have been discovered a few days ago in this vicinity by Wm. Gregg.

VOLCANO.—The rock left on the dump at the time the hoisting works of the Tellurium mine was burned was crushed about two weeks ago, and yielded the handsome sum of $12 50 per ton. The same rock only paid $2 before the hoisting works were destroyed. Free gold could always be seen in the ore, and experienced miners did not understand why it did not pay better. This shows that either the mill was managed poorly or some one was getting away with the gold. A. W. Robinson and Eugene Lucot bave taken out from their claim, located on Kate Gray's gulch, about 50 tons of rock, wbich is being crushed at the Downs mill. Mr. Gillick is still taking out rock from his mine, which shows free gold in paying quantities. Brook and Griesbach had some rock crushed last week which paid $28 per ton. The mine is located on Pioneer creek, about five miles from town

MISCELLANEOUS.—Amador *Ledger*, Feb. 16: S. D. Shugert will start below shortly, principally for the purpose of arranging for the erection of a 20-stamp mill at Hunt's gulch. The hoisting works of the Jackson or Ginocchio mine are being taken down, to be moved on to the Moore mine forthwith. They are of sufficient capacity to sink 400 or 500 feet. At the Zeile considerable work has been done in the way of repairing the shaft between the 600 and 800-foot levels. This section has been thoroughly fixed, and the work of repairing at the 240 level and above will be undertaken at once. The mill is kept running steadily while this repairing is in progress. A reduced number of men have been employed of late, owing no doubt to the fact that the extraction of ore sufficient to keep the mill going requires less men than formerly. The work of reopening the old shaft at the Gover was to be let by contract last week. The shaft has collapsed considerably, and the attempt of the company to re-open it has met with indifferent success, so it has been decided to let it by contract. The contract calls for the re-opening of 70 feet altogether.

VALPARAISO.—Amador *Sentinel:* The work of prospecting the Valparaiso mine has been commenced. Four men have been put on. It is reported that a body of good rock has been struck at the St. Julian. Their mill will be started up in a few days for the purpose of crushing the same. The Moore mine engine and boilcr is being removed from the Jackson mine to the Moore. This would indicate an intention to commence active operations on the latter. Shugert & Morgan intend to erect a 20-stamp mill at the mouth of their tunnel in Hunt's gulch in the near future. They began yesterday to lay pipes for the purpose of hydraulicking off a piece of ground for a mill-site.

Butte.

PREPARING TO DRIFT AT THE CHEROKEE MINES.—Marysville *Appeal*, Feb. 13: The S. V. H. G. M. Co. of Cherokee, Butte county, are engaged in running a long bedrock tunnel preparatory to mining by the drifting process instead of hydraulicking as at present. A series of prospects has developed the fact that the pay streak in tbe mine lays in a. bed of gravel of an average depth of 12 ft next the bedrock. This pay streak is very rich, prospecting from $1.87½ to $4 to the carload. The company is satisfied that it will pay better to drift than to hydraulic. They now have a bank of 400 ft face with a hundred ft bed of pipe clay running through it. The latter is very difficult to work and contains no gold, but must be moved away through the sluices. They now employ 200 men but will increase the pay roll to about 500 men when drifting. The company, the town and the farming country below on Butte creek will all be benefited by this change in the manner of working the mine. It will require about 6 months to finish the tunnel and hydraulicking will cease entirely in that mine in a year or so.

Calaveras.

HAULING ORE.—*Mountain Echo*, Feb, 14: We understand that Fred Brunner's mine has been bonded, and the parties are at present hauling ore to the Marshall mill, near Altaville. The intention is to crush 300 tons of ore for the purpose of prospecting the mine.

THE COMET MINE AND MILL.—Calaveras *Citizen*, Feb. 14. We recently visited the Comet mine, near Donnollan's bridge, and were suprised at the great improvements made at this new mine in such a short space of time. Only a few months ago the place where the mine now is was nothing but a bare hill with quartz strewed over the surface, and here and there a prospect hole dug on its slope. Two well constructed tunnels have been excavated under the hill, on a level with the upper portion of the mill. The tunnels and mill are connected by steel rails—a great improvement on the old wooden rail—as the cars can be handled with ease and swiftness. One of the tunnels is connected with a shaft to the surface so as to enable the ore to be handled with the least possible expense and with great expediency. In fact the whole arrangement is planned admirably so that the ore can be excavated and delivered in the mill at a very small cost. In addition to the afore said tunnels, upon the side hill, are wide and deep open cuts dug to test the extent of the ore, and it looks like an open quarry of decomposed auriferous slate and quartz. The whole side hill seems to be of the same material, and not a difficult matter to see gold here and there through the mass, even with the naked eye. The mill is a 20-stamp one. The building is well arranged, strong, convenient and neat, and complete with all the modern improvements in amalgamating plates. The mill is run by water power, with one of Pelton's wheels, under 290 ft pressure. The water is brought from the Mokelumne Hill ditch, in a new ditch dug by the Comet Co., of three and a half miles in length. The water had to be brought in a pipe 2,000 ft across the Calaveras river. The depression is 380 ft of perpendicular depth, two cables support the pipe across the river. In all it took over 4,000 ft of pipe to deliver the water at the mill. The mill is now running and every thing works well. This mine will be of great benefit to San Andreas, and vicinity—as we have plenty of gold bearing rock all around us and the thing we need is capital to develop our resources.

El Dorado.

MINE BONDED.—*Mountain Democrat*, Feb. 14: H. P. McNevin, formerly superintendent of the St. Lawrence mine, this county, came up from the Bay last week, and while here bonded the Darling mine near Bear creek, in Georgetown township. McNevin is a thorough miner, and the fact that he will at once put a force of men to work, is sufficient to justify the expectation of good results from the Darling.

Inyo.

MODOC CON. MINING COMPANY.—Inyo *Independent*, Feb. 14: Mr. Frank Fitzgerald, Superintendent of the mines at Darwin, has just made the following report of operations to the secretary of the Modoc Mining Company: Have shut down furnace for want of coal. Five days run produced 62,718 pounds of bullion, value as follows, viz.: Silver, ounces per ton, 16.6; gold, per ton, $39.68; total value of bullion, $10,954.96. Will take some time to get bullion to the railroad, as teams are scarce. Resumed sinking in the South Lookout mine, average width of ledge at bottom of winze, three feet; tbe ore contains 36 per cent lead, 69 ounces silver, $12 gold per ton.

BROWN MONSTER.—A lot of ore was shipped this week from the Brown Monster mine to Selby & Co., San Francisco.

Mono.

MAMMOTH.—Bodie *Free Press*, Feb. 13: A party of 8 miners started for Mammoth the other day. They secured a team from Thomas Williams, which will proceed as far as tbe snow line, from thence snow-sboes are used. It is understood that a large stock of provisions were stored in Mammoth last fall and that a little syndicate has been formed to work quite extensively, the coming season. A little quartz mill is to be erected and ore will be taken from the Lisbon and other mines known to yield high-grade rock.

Modoc.

MORE RICH DIGGINGS.—Modoc *Independent*, Feb. 12: A gentleman who came up from Big valley a few days ago informs us that Sam Todd and some other parties are at work on a newly discovered quartz ledge in the vicinity of Stone Coal valley. A shaft has been sunk to the depth of about 14 feet and the rich quality of the rock increases as they descend. The ledge is a well defined one, the casings being of slate on one side and granite on the other. Our informant (who is possessed of considerable capital), took a good look at the rock and came to the conclusion that the mine would be a good thing to own; but after inquiring the price, he abandoned the idea of purchasing, as the amount asked was far beyond his means. The owners think they have a bonanza and say they would not exchange for the whole of Hayden Hill.

Nevada.

MILLS.—Nevada *Transcript*, Feb. 13: The foundrymen of this county will do a good business during the coming summer. The prospect is very good for a number of new hoisting works and quartz mills being erected.

CHAMPION MINE.—*Herald:* A crushing of nearly 30 tons of quartz from the Champion mine has just been completed at the Deadwood mill, and the results, we are informed, were very satisfactory. There was a large amount of sulphurets saved, which is valued at $125 per ton. All operations at the Champion have been suspended, to await the outcome of the lawsuit now pending between the Champion Co. and the Wyoming Co.

ITEMS.—Grass Valley *Union*, Feb. 14: Several tribute companies are at work in the Rocky Bar mine. The water between the fifth and sixth levels of the North Star mine is being lowered rapidly. The work of putting in a 16-inch pump down to the sixth level is progressing satisfactorily. There is the usual rumor tbat the Allison Ranch mine will be started up at no distant day, but nothing is known of a certainty. It will take more work and less talk to put the famous old mine on its feet again, but that it can be made a productive property there is no reason to doubt, in the opinion of experienced miners of the district. The Green Mountain ground on Osborn Hill has been leased by Alex. Sims to a company of working miners, wbo are putting up machinery (the same that has been standing on the Black Lead) to work the mine. The Green Mountain yielded very rich quartz for a time some 12 years ago, and paid a number of handsome dividends to tbe then owners.

THE TEXAS MINE.—*Transcript*, Feb, 13: By throwing up an embankment in the bottom of the shaft and keeping the pumps going constantly, tbe Texas Company have been able to start a drift on the ledge and are now taken out good ore, of which one of the owners says there is a thousand tons in sight. The company had not intended to drift until they got 50 or 60 feet lower than where they are, but having encountered running ground it was necessary to do something of this character to relieve the pressure. If it does not answer the purpose, the machinery will be moved 65 feet further up the hill and a new shaft will be put down.

San Bernardino.

CALICO CROPPINGS.—Calico *Print*, Feb. 15: Barber's mill has been running continually and successfully for sometime on custom ore. It is one of the most complete, best arranged and best managed silver mills on the coast, of its size. Arrangements are being made for enlarging its capacity. It is stated by an old experienced mill man, who has recently had his ore worked at this mill, that any miner who would complain of the management at Barber's mill must be a chronic grumbler and bard to please. Not only is everything done with courtesy and dispatch, but the customer is sure to get every ounce which can be got out of his ore by care, skill, experience and the most improved process. The superintendent, Mr. Sterritt, understands his business thoroughly, is every way reliable and honorable, and every employee from the assayer to the "end man" is fitted to, and trustworthy in his place. The water question is no longer a problem, but an abundant and permanent supply is secured. The rates charged are not in excess of those charged by any other mill, and its convenient location, taken in connection with all its other advantages, is such as to secure a constant supply of ore, with satisfactory results to both partners and the owners of the mill. Messrs. Osborne, Kurtz and Evans, owners of the Sue mine in West Calico, have sold to Messrs. Waterman and Porter one-half of their interests in the Sue, and it is agreed that the quartz mill at Resting Springs belonging to Mr. Osborne shall be removed to Calico district and increased to a capacity of 15 stamps, the same to be used in crushing the ore from the Sue and other mines of the company. Chloriders on the Silver quartz lode have discovered a rich vein of mineral, which is in all probability an extension of the Sue ledge. There are at present eight men working on said claim, which in the near future is likely to turn out a bonanza for the owners.

Shasta.

AROUND THE COUNTY.—Shasta *Democrat*, Feb. 14: Kempton's mill on Salt creek is running $50 rock. At the water level the ore improves. More heavy milling machinery arrived at the depot last Thursday and was freighted to Copper City. A couple of miners last week discovered another gold-bearing quartz vein on the head of Oregon gulch. Last Thursday a couple of prospectors arrived in Redding from New River. They report the new camp booming. The new gold find on Squaw creek is said, by reliable parties, to be a veritable bonanza. Conant's claims prospect amazingly. Col. Magee returned from 'Frisco last Thursday evening. He says mining men of the city are greatly excited over the mining reports from Shasta and Trinity, and a swarm of them intend to visit the two counties soon. We hear it reported, but cannot vouch for the truth of the statement, that an English company, with large capital, have become interested in the big lumber enterprise Loy & Blood have been engaged in for the past year or more on the Big Bend of Pit river. Last week a chunk of gold bullion, weighing 45¼ ounces, was shipped to the mint from the Washington mine at French Gulch, the clean-up from seven tons of ore taken from the lower level. Foul air drove the miners, for the time being, out of the tunnel, but this will soon be overcome. John Neal brought to our office last Friday samples of quartz from a ledge he discovered the day before on Oregon gulch. The rock shows well in free gold. Dale & Fife, the gentleman who bonded the Silver King mine, near Centerville, have ten men at work, instead of six, the number we reported last week. They have made quite a lively camp in a short time, and are putting down a shaft at a lively rate. The Afterthought mine at Furnaceville has been bonded for an indefinite period to A. J. Loomis, of Red Bluff, one of the principal stockholders, and he has now complete control of that property. Mr. Loomis does not intend to work the mine himself, but expects to sell or lease it to parties who are able to put up the necessary machinery to successfully work the ore, which is rich but refractory. Considerable excitement has been created by the recent discoveries on Squaw creek. Several mining experts and operators from San Francisco are now on the ground watching developments. We understand that Coonant, the discoverer, has bonded one of his claims to some Idaho parties for $50,000. The main ledge averages about six feet in width of porous white quartz, in many places showing free gold, while all the rock shows up gold in pan and spoon tests. The mines lie due north of the Windy Camp group, and are in the same feldspathic porphyry formation. Judging from samples of ore placed in our mineral cabinet, the Fair View and Red Bird claims on Salt creek are the making of splendid mines. The Fair View is the property of Mr. Kempton, and the Red Bird was located on the 19th of last January by Mrs. Rittie Kempton. A small cannon ball mill is constantly running on ore from the Fair View, and so far the ore has been averaging $50 per ton. Sufficient work has been done on the Red Bird to show that there is a large body of high grade ore in sight.

Sierra.

PROSPECTING.—Sierra *Tribune*, Feb. 14: Lindsey & Co. are prospecting a ledge with good results at Poker Flat. They have made developments sufficient to justify them in building a mill in the spring. Three hundred ounces of bullion was shipped from Howland Flat last week. The gold was taken out of the Virginia drift mine, at that place. From Poker Flat the news reaches us that Gardner & Co. took $4,000 out of the Belmont quartz claim in a very few days recently. Considerable quartz prospecting is going on around Alleghany. There are some good ledges over in that section. All that is needed is a little capital to develop them. W. H. Weldon, owner of the gold King mine, near Alleghany, is expected up from below soon. The lower tunnel at the claim is still being pushed ahead. Parties who are acquainted with the mine say that it has a fine outlook.

Trinity.

FOUND IT RICH.—*Journal*, Feb. 14: W. M. Casley, of Buliychoop, informs us that Hoskins Bros. have struck it rich in the Little Gem mine (formerly known as Rattlesnake) in that district, and that they expect to put up a 10-stamp mill in April.

LOOKING AT MINES.—Mr. Chas. T. Hoffman, a well-known mining expert from San Francisco, visited Deadwood last week with a view to investing in quartz mines in that flourishing district. He left for the city on Friday last, being highly pleased with the prospects and promising to return in a few weeks.

THE BROWN BEAR MINE, of Deadwood is one of the good things of Trinity county. Not only is it a paying property in the bands of its owners, but one which is of great benefit to the community. In conversation with Supt. Watt—who visited town in company with his wife this week—we learn that the mine directly and indirectly contributes to the support of not less than 50 people; no Chinese employed either. They have a 10-stamp mill, with Frue concentrators and sulphuret reduction works connected tberewith. There are several other mines in that district which, when properly developed and put in active operation, will be as prolific of good results as the one to wbich reference is here made. The Barted mine, belonging to McDonald Bros. & Franck, also employs many men about the 5-stamp mill and in the mine.

NEW ROUTE TO NEW RIVER.—Shasta *Democrat*, Feb. 14: A gentleman who returned from New river last week gives tbe distances from Redding to that mining district via Coffee creek as follows: From Redding to Trinity Center, 47 miles; thence to head of Coffee creek, 24 miles; thence to Cicilville, 16 miles; thence to the mouth of Plummer creek, 7 miles; thence to Mary Blaine mine, New river, 12 miles; total, 106 miles. This is said to be the best route through the mountains, the trail all the way from the mouth of Coffee creek being open and on an easy wagon-road grade. Quite a number of old prospectors and mountaineers, who know every foot of that country, say this is unquestionably the cheapest and easiest route to the new El Dorado. At Carryville good saddle horses can be hired at any time at reasonable rates. Tbe whole route leads through a mineral belt which, practically, is yet unprospected. For prospectors, at least, it is the best route. By the other route—the stage and saddle short line—it can be made in two days from Redding. Take the morning train to Delta, from which a pleasant horseback ride of four or five bours at most, over a good trail, lands the traveler in Trinity Center. The distance from the Mary Blaine mine on New river is less than seventy-five miles. This we are assured to be true by one who has traveled the mountains between the Sacramento and Salmon rivers for the last twenty years.

NEVADA.

Washoe District.

CROWN POINT.—*Enterprise*, Feb. 14: A large amount of low-grade ore is being extracted and sent to the mills on the Carson river. A considerable amount of prospecting is being done at various points for the purpose of opening out new deposits.

YELLOW JACKET.—The old upper levels still continue to yield a large amount of low-grade ore, which is sent to the mills on the Carson river for reduction. Explorations are being made in various parts of the mine.

OPHIR.—The north lateral drift on the 500 level is being advanced rapidly. It is being run along the west wall and will be continued through the Mexican and Union Consolidated ground.

GOULD AND CURRY.—The new joint station on the 1000 level of the Bonner shaft is completed, and explorations will now be made in ground never before prospected.

HALE AND NORCROSS.—Work on the 2900 is being pushed, and it is reported that the prospect of finding something rich on that level is very good,

Columbus District.

MOUNT DIABLO.—*True Fissure*, Feb. 14: The west drift on the sixth level is now in 126 feet, having advanced 16 feet during the week, and the south cross-cut from this drift is in 18 feet. The west drift on the fifth level shows a little low-grade ore in the face. The raise from the west drift on the fifth level is up 78 feet, and shows a foot of $30 ore. The drift to connect with this raise has 30 feet to go and shows some $40 ore. The stopes below the third level show no change of note, but are all turning out a little ore. The stope west of the shaft between the second and third levels, is looking very well and giving considerable $60 ore. A small amount of $80 ore is being taken from the east drift on the second level, and some ore of good grade is being taken from the west drift on the same level. The intermediates stopes, between the first and second levels, are giving a little ore of good grade. Some ore of fair grade is being taken from the first level, and a small amount of ore is being taken from the Mount Diablo adit.

Cortez District.

LOOKING WELL.—Cor. Eureka *Sentinel*, Feb. 15: A gentleman from Bullion informs me that things are looking pretty well across the valley from us about 15 miles. Steve Bidwell, lately from Silverado, near Eureka, has made an important strike near the Eagle mine about four miles north of the Lady of the Lake. The ledge is undoubtedly the one which has been searched for time and again by different parties. It is a fissure vein ten inches in width, assaying from $300 to $700 per ton. A lucky Eurekan! Still further north, near the park called Coral canyon, is a mine found last spring. It has made a shipment of ore averaging $380 per ton. Charley and John Twiss five miles east of Bullion, have a splendid body of ore in their mine. They shipped several carloads last summer. Their ore is of a high-grade quality. There are 12 men working in the Silversides at Bullion, which is producing some splendid ore. The Lady of the Lake is working steadily. The mill is running and regular shipments of bullion are made. Jim Campbell is working one of his limestone district mines, and has encountered a body of ore. I don't know how large it is, but it assays from $300 to $1,200 per ton. All those mines are on the edge of Lander county. We of Cortez are doing pretty well. Gillam Bros. & Tex are now sinking a shaft and driving their tunnel to connect. The shaft is sunk in ore, and this proves to be a fissure vein as far as seen. S. E. Ducommun has struck ten inches of splendid ore in the Silver Fleece, William Lewis is producing some good ore. Major William Earls is driving a tunnel, or, more properly speaking, is splitting the hill wide open, on account of a rich ore streak that shows itself on the surface. The Aurora has two fine bodies of ore in the lower tunnel. The ledge is stripped for 30 feet. There are 18 inches of red ruby ore going down in one place. A raise has been started from the upper tunnel to the surface, producing a high-grade of antimonial silver ore.

Eureka District.

ORE SHIPMENTS.—Eureka *Sentinel*, Feb. 14: The following ore shipments have been made to the Richmond Con. furnaces during the week ending yesterday, the first two mentioned being exceptionally rich: Lord Byron, 37 tons; Silver Lick, 52; General Lee, 20; Bowman, 9½; Oriental and Belmont, 30; Mimbres, 10. The roads being in a rather bad condition, it is natural to suppose these

shipments for a while will show a slight falling off. All the above mines are, however, said to be looking well.

THE RICHMOND CON.—Owing to the bad weather and the still worse condition of the roads during the early spring months in this section, the Richmond Con. reduction works will cease operations on the 28th instant for probably six weeks or two months. The company refuses to buy any more flux ores at present, but will continue to purchase milling ores even during the cessation of work. Over 100 men will be temporarily thrown out of employment.

THE EUREKA CON. WORKS.—*Sentinel*, Feb. 12: Work in connection with the new buildings and the new furnace at the Eureka Con. reduction works, is progressing favorably. Work on the building, wherein ores will be received, sampled and mixed is now being vigorously pushed, inasmuch as the company will not be able to receive much ore until the structure is well under way. It is believed that in the course of a week they will be able to receive ores to the extent of several thousand tons.

Grantsville District.

WORK AT GRANTSVILLE.—Walker Lake *Bulletin*, Feb. 14: The Alexander mill, at Grantsville, will soon resume work on tailings. These tailings are worth about $12 per ton, and the promoters of the enterprise expect to make a handsome profit.

Rebel Creek District.

ORE FROM THE OHIO MINE.—*Silver State*, Feb. 14: E. O. Conner's team arrived yesterday from the Ohio mine, at Rebel creek, with 100 sacks of ore for shipment to Salt Lake. The roads are so soft that 20 sacks of ore, weighing about a ton, had to be unloaded by the teamster on his way here.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Feb. 13: On account of repairs at the main shaft, but little work has been done under ground the past week.

NORTH BELLE ISLE.—Drift north on the 150-foot level, has been extended 15 feet. The face of the drift shows a favorable change.

NAVAJO.—Repairs on the shaft and gallow-frame will be completed to day. The pumps will be started sometime to-morrow, and work will be resumed under ground in a few days.

INDEPENDENCE.—East cross-cut, 400 foot level, has been advanced four feet; total length, 39 feet. The rock is extremely hard. South drift, same level has been extended 27 feet; total length, 1,039 feet.

Willow Creek District.

PROMISING.—Cor. Eureka *Sentinel*, Feb. 12: Since my last communication Willow creek has made considerable advancement as a mining camp. Work on several of the claims has been prosecuted in a thorough and business-like manner with very good results. The miners are beginning to find out that dreaming and toasting their shins behind a harroom stove is a poor substitute for pluck, muscle and giant powder in opening up their claims, and the result is very gratifying. The mine, which is now attracting the most attention in this camp, and which gives the most promise of being a producer in bullion, is the Wild Deer. The ledge running north and south, has been tapped in a dozen places on the surface the entire length of the claim, 1,500 feet, and just in the center has been opened by an incline shaft, now down 130 feet. Drifts have been run north and south from the 100-foot station in the shaft, directly on the ledge, about 100 feet each way. The north drift shows rich ore nearly its entire length, the vein varying in thickness from one to four feet. The richest chute of ore is evidently pitching north, as the south drift is somewhat barren, though showing the same unbroken ledge. The best showing at present is in the incline. At a depth of 130 feet the entire face is in quartz, with from two to three feet of very rich ore on the footwall. A large number of assays, just completed from this place, gives an average of nearly $200 per ton, mostly silver, though some of the samples went as high as $75 in gold. Work is now being pushed day and night in the shaft. A tunnel has just been started on the ledge several hundred feet down the mountain, which is intended ultimately to connect with the incline, and at that point will tap the mine at a depth of 400 feet. The first contract of 200 feet has been let. One of the best claims on Willow creek is the Southern Belle, owned and worked by John Bergen, an industrious and enthusiastic prospector. Recent developments prove the existence of a strong ledge, assays from which run from $30 to $200 silver per ton. Some galena is found in this ledge, which is unusual for this district. The Ohio mine is employing about a dozen men, and has recently added an assayer to its force with a complete assay outfit, by which means a regular weekly statement of the grade of ore encountered in the various workings may be rendered. The same plan is adopted at the Wild Deer mine. Mr. John A. Kean, well known in Eureka and Secret canyon, is assayer at the Ohio.

ARIZONA.

FROM DIFFERENT DISTRICTS.—Prescott *Courier*, Feb. 14: Rich gold-bearing rock is being taken from the Sterling mine, 6 miles south of Prescott. A body of rich gold ore was recently struck in the Montgomery mine, Representative W. H. Robbins is in receipt of a letter from a friend in Alexandra, Peck district. Letter takes a hopeful view of the mines and mining in the district. Good ore is being taken out of several lodes and it is expected that a great deal of silver will soon be concentrated out of Peck tailings. Sheriff Mulvenon is in receipt of good news from Turkey creek district. Miners are sinking on their best ledges and saving the richest ores for shipment. It is stated that there will be a big camp at Del Pasco early next spring, when the mill will be set running. Placer miners of Weaver, Hassayampa, Walker, Black canyon and some other districts are, we hear, doing well. It would be a grand thing for this section if the Howell reduction works were placed in running order under some man like John Howell, who does know how to manage mines, mills, etc. With the addition of some more machinery the "works" would be so complete that nothing more would be required to work the most rebellious ores of this section. Prescott is the proper place for work of this kind.

GOOD ORE.—Mr. D. W. Clearwaters has struck very rich and handsome silver ore in a new shaft he is sinking in the Howard mine. Ore worth between $300 and $400 per ton. It can be seen at Joe Wilson's clothing store. Mr. M. L. Lawler has news from Agua Fria district to the effect that mines there are yielding plenty of rich silver ore.

A BIG BONANZA.—*Sentinel*, Feb. 14: D. M. Field, of Tacna station, came into town last Sunday. He reports the organization of a new mining district in the Cabeza Prieta Range, near Tule Wells. The district is six miles square and is known as the Cabeza Prieta mining district. The celebrated gold mine known as the "Chloride," recently taken up by D. M. Field and George Hurley, is located about the center of the district, and is said to be the richest strike ever made in this country any where. This location was an old prospect discovered about 15 years ago by a Mexican, and an assay of the ore then made gave a return of $900 to the ton in gold. J. M. Redondo, who intended to go on with the mine and work it for a certain share with the discoverer, died soon after completing arrangements. The discoverer, who having become discouraged at the death of Redondo, took sick, and he too, soon died. All this happened some 15 years ago and during all this period of time the mine has been idle, as no one knew of its exact locality. Several persons had been looking for it for weeks and months but without success. Finally the wheel of fortune turned in favor of D. M. Field and George Hurley who became the lucky finders and who feel very much elated over their splendid luck. They say they have the biggest and best mine in the United States, or perhaps, the world. This great bonanza is about 75 miles southeasterly from the Tule Wells, in this county. It is about 35 miles from Tacna, the railroad station. The ledge is 40 ft wide, and the very surface rock assays $90 to the ton. The ore is of a peculiar texture and can be worked with ordinary picks and shovels, and without blasting.

ALDER.—Houston *Press*, Feb. 14: We are under obligations to E. M. French of the Half Way house, for a number of fine specimens of ore from prospects in Alder mining district. This district is rapidly becoming prominent for the number of rich finds being made and the quality and quantity of ore uncovered. The specimens before us are from the following properties: The Superior, located between the Alice and Isabel, shows a 4 ft vein in an incline which is down 20 ft. A working shaft is being sunk which cuts a solid body of ore 18 inches thick. The returns from assays show very high grade ore carrying galena, carbonates and chlorides. The Superior is owned by Owens and Hall. The Isabel is a very promising prospect having returned assays of from 200 to 300 ounces of silver to the ton. The Pinacle, an extension of the celebrated Mammoth mine, carries both silver and copper in paying quantities. Messrs. Owens and Hall have another prospect of fair promise located several miles up the river which helps to substantiate the theory already advanced by the *Press* that the mineral belt on the west side of Big Lost River is continuous from the Lava creek district to the headwaters of Lost River. The bodies of ore uncovered in this section seem to surpass, in bulk, anything previously found in this Territory and as the majority of the finds have paying ore it is reasonable to predict a great boom on Lost River during the present year.

COLORADO.

LEADVILLE.—*Mine, Stock and Rail*, Feb. 12: Several new strikes are reported from the Adelaide. The Forest City is shipping about 60 tons of ore a day. The Denver City is continuing its shipments of low-grade ore. The Constance, on Iowa gulch, will be in good working order in a few days. The Dunkin mine shipped last month about 100 tons of ore, some first, but largely second class. The present coal supply for Leadville comes from Coal creek, Como and Gunnison; coke from El Moro. Mr. Sam Adams reports the shipment last month of about 1,200 tons of ore, of which the larger part went to Pueblo. Mr. G. Richards, owner of the Grafton, has commenced the sinking of a deep shaft on the west line of the Fairview, belonging to the Chrysolite group. Mr. Adams of South Half Moon reports that good ore is being stoped from the lower tunnel of the Crown Point mine, about 250 ft in. The Adams shaft is being sunk deeper; a depth has now been gained of 95 ft, where there is pay ore covering expenses. The Susquehanna and Iron Duke are both producing. A large body of sulphide mostly galena, of a very high grade of silver, was recently encountered in the very midst of the great Sellers ore chute. Mr. George Summers, manager of the Yankee Doodle, has let a contract to F. O. Miller and another miner for sinking the new shaft on the break of the Carbonate Hill contact vein, to the depth of 260 ft, 4½ by 8 ft in the clear. The Small Hopes Mining Co. has let the contract for sinking a new shaft on the Result, one of the claims of the company. The shaft will be commenced next Monday. The Lillian stamp mill will be completed and ready for business in a few days. Leadville sampling works have received of late sundry shipments of Aspen ore, but not much as yet. Smelters are crying for cars in hard weather. The American is running only two stacks this week. Bullion prices per ton at Leadville have averaged this week $34. Mr. J. S. C. Manville quotes bullion freight from Leadville to Missouri River points at $22. Leadville smelters still manage to smelt, notwithstanding the large shipments of ore to Pueblo. There is an advantage in their familiarity with ore resources and their presence on the spot, which is rarely taken into consideration. A good many shippers want to have their ore sampled right here, and thus avoid the loss on transit. The market for iron fluxing ore with a fair grade of silver is very dull. The output of the Lee, joined to that of others, has been so large for the last three months that the various works here and in the valley are pretty well supplied for the present. The Lee shipped about 4,000 tons during that time. The Wolf Tone will be shipping ore within a week. A station is now being built at the depth of 685 ft, where there is a body of carbonates averaging 30 per cent of lead. The Little Pittsburg Mining Co. has at last effected the damage of Little Pittsburg No. 6 and an increased output may be expected. The present output goes to the Harrison. The Denver City paid well in January. Among its shipments were sundry lots milling from 50 to 70 ounces of silver.

GENERAL NOTES.—Georgetown *Courier*, Feb. 14: Much development work is being done by contract on the Albro mine, at Dumont. The lessees on the Centennial mine took out 15 tons of ore last week. It returned them, net $32.45 per ton. The lessees on the Lucky-Hesperus, Democrat mountain, have nearly 4 inches of mineral in the stope above the second level. About 10 tons of ore were shipped a few days ago from the Seven-Thirty. The ore ran from 125 to 300 ounces silver per ton. The Humboldt mine in Caseade district is producing some excellent ore, a recent millrun from which returning $700 per ton. Idaho Springs will have another sampling works, which will be built just above town by the owners of the Idaho sampling works. John Frazier is working the Watts load on Democrat mountain, and has nearly 4 inches of ore. He had a millrun last Saturday which returned him over $400 to the ton.

IDAHO.

THE RED ELEPHANT.—Wood River *Times*, Feb. 12: M. T. Richardson, owner of the Red Elephant group of mines, of Bullion, was in town yesterday, selling a small trial lot of ore which was extracted from the 140-foot level. The lot weighed seven and a quarter tons, assayed 151 ounces silver and 53 per cent lead, and sold for $1,024. The cost of mining, sampling, etc., having been only $394, the net profit on this trial lot was $630. This was not selected ore, by any means. Mr. Richardson wishing to get an idea of the real value of the ore, just had a lot knocked down, which was simply cleaned a little, sacked and shipped. The vein is five inches wide, of solid galena that requires no "sorting," as it breaks clean. This shipment proves that the ore gets better in depth, as the shipments heretofore only averaged 90 ounces, and Mr. Richardson is confident that in a short time he will be able to show a mine.

SHUT DOWN.—The last day of January the miners working in the Vienna and Mountain King mines, at Vienna, were notified that on and after the first of February the rate of wages would be only $3 50 per day, instead of $4 as heretofore. The majority of them at once indicated their intention to quit work, whereupon the foreman, George Franeey, at once left for the railway and Salt Lake, to hire other men. He was soon followed by about 60 of the boys about 40 of whom have already arrived at Ketchum or Hailey, while some have gone on to Salt Lake to notify the Utah boys of the condition of affairs. Of the 40, over 20 are stopping at Baxter's, Ketchum. They state that the mill has shut down, and only about 20 men have continued working at the reduced rate.

TERRITORIAL NOTES.—Ketchum *Keystone*, Feb. 14: Several lots of silver have been shipped from the Horn Silver mine, Lava creek, near the Blackfoot road, the average of which per ton was $780. The mine was discovered in June last. J. P. Underwood, writes that the mines in Lava district, which have been worked, are all looking splendid this winter. The ore recently worked from the Oro Fino by Scales and Wagner, milled about $240 per ton. Mr. McMahon is taking out more of the same kind. News comes of a four-foot strike of high-grade ore on the McLellan, a claim adjoining the Mayflower mine, at Bullion. The Caldwell *Tribune* says the placer mining companies are getting ready for spring work. It is expected that the Snake river placers will produce more gold the coming season than for two or three years past. The new style riffle and the burlaps are a success.

MONTANA.

WILD BILL.—Butte *Miner*, Feb. 14: The Wild Bill continues to improve as further development progresses. The new body of ore reported struck two weeks since, has opened out from four feet to fifteen feet in width, and no further wall found as yet. The men are working in the stopes, and continue raising valuable ore, which goes 26 ounces in silver and from 20 to 30 per cent in copper. Mr. Jere Roach, who owned a half interest, has sold it for $20,000. His interest was under bond, and was taken without a question as to the value of the mine. The property can be rebonded to-day for $125,000.

THE GREY EAGLE, owned by Dennis Leary, and now under bond for $10,000 to Quinn & Fletcher, is planning out well. The bondors are also the lessees for a term of 18 months. At a depth of 50 feet the workmen will begin cross-cutting to catch the main vein, and expect to get it, in a run of 16 feet. This vein, on top, shows 11 per cent of copper and 20 in silver. The ore in last strata crossed has not been assayed. Another new strike is reported in the Neptune mine. Some of the ore is on exhibition, and appears to be loaded with native and wire silver.

THE ROCK ISLAND.—Since the *Miner's* last report a cross-cut has been run from the main shaft at the 160 foot level, a distance of 14 feet south, where a large body of rich ore was encountered. A level was started and run 15 feet west, when another cross-cut was run for 12 feet into the main ore body, which is all very rich, the whole face going 56 ounces. The workmen will continue to work in those connections, which will facilitate the extraction of large bodies of ore. The promises of the mine are far better than ever before. The shots in the Lexington mine are distinctly heard in the levels of the Rock Island, and the fact of the main vein of both mines being one, and the same is established beyond dispute.

FROM GLENDALE.—In the Hecla mines work is going on day and night with a large force, and shipping 50 tons of first-class ore daily. Aside from this, from 50 to 75 tons of second-class ore is hoisted daily, preparatory to the starting up of the concentrator. The Co. has a large amount of second-class ore ready for work during the coming summer. The bodies of ore in the mines are looking well. The works are entirely under shed, and hence the storms do not effect the workmen in the least.

A RICH STRIKE.—About a week ago a very rich strike was made in the Amy-Silversmith on the 100-foot east level, at a point about 50 feet from the shaft. The vein in the face of the drift is 14 inches wide, and surpasses in richness anything ever before seen in the claim.

NEW MEXICO.

ORGAN.—Cor. Rio. Grande *Republican*, Feb. 14: Several more men have been put to work on the Jay Gould, and the timbers for the whip to be erected at once are on the way. Sam Hughes, has taken out some very fine ore, and the Urquhart Bros, are also taking out good ore, and it all comes from the Little Buck. The outlook for Organ is splendid, and she will be far more flourishing this summer than ever before. Several properties will be worked, which have heretofore lain idle, and the smelter in full blast with plenty of money to settle all indebtedness which may accrue. Messrs. Joblin, Cunningham and Roney, came out Wednesday, and we understand that everything has been settled amicably in regard to the Memphis and smelter troubles. Capt. Jesse Young, has taken a three months lease on the Silver Star from Mr. Perkins.

FLEMING AND BLACK HAWK.—Silver City *Enterprise*, Feb. 13: During my trip around the mining camps surrounding Silver City I have invariably heard a general complaint that the mines of this section are not holding their own, etc. This may appear so to those who will not take the trouble to give the matter the necessary thought, but to others it is altogether different. Our mines are far in advance compared to this time last year, and have found some very surprising facts staring me in the face during my late visit. The Black Hawk mine at Bullard's Peak deserves especial mention, and the body of ore now exposed at the eight level has to all appearances the staying qualities which veins of that character and depth usually show. Other properties in that camp will be brought out during the coming summer and the future of Black Hawk is assured. About two years ago I visited Fleming, which at that time had not as much as a tent to show that here in such a short time a flourishing camp was to be located. Imagine how the dullness(?) of New Mexico's mining industry struck me when I found some two or three dozen comfortable dwellings and half a dozen business houses erected, the hills fairly torn asunder and miners now down 100 ft or more taking out the rich metals for which this country is noted. The first plant of steam hoisting machinery is now fast approaching completion, and this is what Flemingites call the beginning of a long siege of successful mining. If these are considered hard times in mining, then New Mexico miners must surely have had a bounteous season in the past. I have had several warm arguments with some of the best miners and prospectors in this section, and although the boys spoke very discouragingly, I have invariably convinced them that they had no grounds for complaint.

OREGON.

GENERAL NOTES.—Jacksonville *Times*, Feb. 14: Most of the miners have enough water to do some work. Promising quartz has been found on J. M. Smith's premises in town. Wagner creek is developing into a mining camp. Several parties are doing well there. John Miller's hydraulic mines on Farmer's flat are being operated successfully. Considerable mining is now being done on Forest, Poorman's and Jackson creeks. The rains of the past week have aided the miners materially and it will not take a great deal more to ensure a good season for them. G. B. Caldwell & Son are running a ditch to their mines in the Steamboat district and expect to commence piping before many weeks. Jos. Goldsworthy of Foot's creek informs us that not a great deal of work has been done there as yet, but a good season is anticipated. Jos. and Capt. Saltmarsh of Sterlingville were in town yesterday and inform us that they have been unable to mine any so far. However, that is one of the dryest districts in the county. Parties are prospecting on G. H. Lynch's place in the Wagner creek district; also further up the creek. They report favorable developments, the only drawback being the depth to the bedrock. Ex-Sheriff Bybee returned from Josephine county this week and informs us that the miners of that section have a considerable water supply and expect to make a good report this season. A correspondent writes us that John Lewman of Applegate says he recently made a new strike on the ledge at Brushy gulch. The quartz is very rich, showing free gold. Prominent assayers say that it will yield from $75 to $100 per ton.

UTAH.

PARK NOTES.—*Record*, Feb. 14: A force of men are at work on the claims of the Park City Company, doing assessment work. Mr. John Farrish has been driving a tunnel on one of his claims up Nigger gulch. The tunnel is in a distance of 50 feet. Mr. Farrish has a group of claims in that locality, and expects that he will be able to make a good showing on them as soon as he attains depth. The report of a new strike in the Crescent property is denied by Mr. E. P. Ferry, who states that nothing unusal has been opened up there. He says that every day sees new ore bodies of greater or less extent opened up and that the mines are steadily improving. Mr. L. Cieutat who is working the Star on Treasure Hill, brought us in a very fine specimen of carbonate this week. This ore is a very high grade, and is the finest we seen from that locality. Mr. Cieutat deserves to strike it rich on his claim as he has kept at work on it whenever he had a spare moment. Mr. D. F. Condon, presented this office with a fine specimen of ore from the Creole and he expects from the showing to be able to make the Creole one of the shippers of the camp in the spring.

SILVER REEF.—Southern Utah *Times*, Feb. 14: Two mills, one of a five and the other a ten stamp mill, are steadily engaged in crushing the ore extracted from the mines of the Christy and Stormont. About 300 men are employed at the mines in the Reef. Wages are down to $2.50 and $3. A solid and substantial basis, but not gilt-edged.

REVIEW.—Salt Lake *Tribune*, Feb. 13: The week has been a stormy one, with more snow in this valley than before in twelve years. The receipts of bullion and ore in this city for the week ending February 11th, inclusive, were: Of bullion, $75,-799.55; of ore, $12,143.92; total, $87,943.47. The week previous the receipts were $99,942.87 in bullion and $22,458.44 in ore. The Horn Silver continues to pile up its product at the smelter. The Ontario shipped during the week fifty-three bars of bullion, assaying $38,310.28, bringing the total product of the year up to $197,865.87. The Christy sent up from Silver Reef two bars of silver ($2,890), and the Stormont two bars ($2,200); a total of $5,090 from that district. The product of the Germania smelter for the week was ten cars of bullion, $22,139.27. Two gold bars were received on the 7th, valued at $2,500.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by

DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1887.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free.
